This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world’s books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that’s often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book’s long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ **Make non-commercial use of the files** We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ **Refrain from automated querying** Do not send automated queries of any sort to Google’s system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ **Maintain attribution** The Google “watermark” you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ **Keep it legal** Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can’t offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book’s appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google’s mission is to organize the world’s information and to make it universally accessible and useful. Google Book Search helps readers discover the world’s books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at [http://books.google.com/](http://books.google.com/)

AMERICAN CYCLOPAEDIA.

Evesham

Evesham, a parliamentary borough and market town of Worcestershire, England, nearly encircled by the Avon, 13 m. S.E. of Worcester; pop. about 5,000. It is well built, and contains three churches, a mechanics’ institute, reading rooms, and a library. The remaining tower of the once famous abbey of Evesham is one of the finest architectural specimens of the time of Henry VIII. The chief occupation is gardening, but gloves, hosiery, and parchment are manufactured, and there is an active trade in malt and hops.

Evidence. Judicial evidence differs from the proofs by which human judgment is ordinarily determined in non-judicial matters, chiefly in certain rules established for the sake of facility in disposing of complicated questions of fact, or on grounds of public policy. These rules may be reduced under the following heads: 1. cases in which a rule is prescribed for the purpose of getting at a certain conclusion, though arbitrary, when the subject is intrinsically liable to doubt from the remoteness, discrepancy, or actual defect of proofs; 2. cases in which evidence is excluded on the ground of being untrustworthy and tending to unnecessary proximity, or from its very nature likely to be untrue; 3. cases in which a legal presumption is substituted for actual proof, or in place of what could be proved, being supposed to be more consistent with the real rights of the parties than any result which could be expected from positive testimony; 4. the graduation of the weight of evidence, which will be found in some instances to be arbitrary in its origin, and perhaps not altogether in accordance with the ordinary process of judgment. — Under the first class will be included various rules which have been adopted, not from exact uniformity per se, but for the sake of having some rule of general application, among which may be specified the following: a. That after seven years’ absence without having been heard from, a man shall be presumed to be dead. It is obvious in this case that the period fixed upon is no more certain than any other, but it was necessary, for the protection of the rights of parties who were compelled to act upon some presumption, that a legal rule should be established. If a man therefore has been absent seven years without anything being heard of him, his wife may marry again without incurring a penalty for bigamy, though it has not been provided that the second marriage shall be absolutely valid in case the husband should afterward return; and his heir, or the person entitled to his estate by succession, becomes vested with presumptive ownership, the same as if his decease was actually proved. b. That after the exclusive possession of land or of an incorporeal hereditament for a certain period of time, a grant shall be presumed, and the title of the occupant will be sustained against all claimants. In England this period was formerly expressed with some vagueness, as being beyond the memory of man, and the rule applied there only to incorporeal estates; but by a statute (2 and 3 William IV.) the period has been limited to 20 years in cases of aquatic rights, ways, and other easements, and to 80 years in respect to right of common and other uses arising out of lands, except tithes and rents. In the United States the presumption is generally the same both in respect to corporeal and incorporeal estates. In a large number of the states 20 years’ exclusive, undisturbed, and uninterrupted possession, under claim of right, is sufficient to establish title to lands or easements. In some states a shorter period is prescribed, either generally or for particular classes of cases, as for example those in which the claim of right is under purchase at a tax or judicial sale. c. That deeds more than 30 years old may be used as evidence without proof of their execution; in other words, that they
prove themselves. The presumption in such cases is that the subscribing witnesses or others by whom proof of execution is ordinarily made may be dead, but the rule is the same even if such witnesses are actually living. In offering such a deed in evidence, however, it is necessary to give some account of the custody of it, and to show that possession has been consistent with its provisions, so as to rebut any suspicion in respect to its genuineness. An infant under the age of seven years is conclusively presumed to be without discretion. Beyond that age it will be a subject of proof whether he is dolus capacis, but prior to that time no inquiry is permitted. So an infant under the age of 14 is presumed incapable of committing a rape, though in fact there are instances of sexual capacity before that age. So when husband and wife are living together and impotency is not proved, the issue will be presumed legitimate, although it should be proved that the wife has been during that time committed adultery. By common law, if a wife do any act in the presence of her husband amounting to felony, other than treason or murder, she is presumed to have been under coercion, and therefore not criminally liable. This presumption, however, is allowed but limited force in the United States.—The second class of cases includes two rules which were formerly of very frequent application. a. What is called hearsay evidence is inadmissible. By this is meant that a witness should not be permitted to testify what he has heard another person say, but only what he knows himself. To this rule there are some qualifications rather than exceptions. Thus it is sometimes proper to prove what was said by a person at the time of performing a certain act, as having some tendency to explain the intent, and therefore admissible as a part of the res gesta, according to legal phraseology. In such a case, however, what was said does not strictly come under the designation of hearsay, but is itself a principal fact. So also it is admissible to prove what has been said by a party to an action. This again is a principal fact, or at all events comes under the designation of declarations or admissions, and as such is admissible. So it is permitted in cases of homicide to prove dying declarations, that is, what is said by the murdered person shortly before and in expectation of death. This is not unusual in trials for murder, and is competent evidence, both to show the manner of the death and who was the murderer; but it must be strictly confined to the homicide, and to facts which it would have been competent for the party to have testified to had he survived. The testimony of a witness on a former trial may also be proved on a second trial, in the case of his death prior thereto. Again, witnesses are allowed to testify to matters of tradition in respect to old boundaries of estates. The rule in England is limited to cases in which some public right is involved, as when a right of common is in question; but in the United States it has been allowed in many cases where the lines of large tracts of land became material in determining the limits of collateral estates. The traditional evidence, as it is called in such cases, consists of proof of what has been said long since by persons who may be supposed to have had some personal knowledge, or to have heard from others who had such knowledge. Pedigree, including the facts relating to birth, marriage, and death, may also be shown by proof of what has been said by members of the family or relatives of the person whose parentage or relationship is in question. Many other illustrations could be cited, but these will suffice. It should be remarked that upon the same principle by which the kind of evidence last referred to is admissible, other modes of proof, which are ordinarily classed under hearsay, though they in fact belong to that species of evidence in no other sense than as above explained in respect to oral testimony, are admitted, such as a family register, inscriptions on monuments, and the like. But with the exceptions, if they may be so called, which we have specified, hearsay evidence is wholly and absolutely excluded by the English law. The reasons usually given for this exclusion are its uncertain and untrustworthy character, the endless prolixity to which it would lead in the attempt to sift facts in judicial proceedings, the ease with which it might be manufactured for the occasion, and the probability that better evidence is attainable. b. Another rule relates to the competency of witnesses, and it has been more prolific of subtle distinctions and perplexing questions than any other rule in the law of evidence. A chief ground of exclusion was formerly interest in the subject of the action. The theory was that there is an inevitable tendency to suppress or pervert the facts under the influence of a supposed interest in the result. This of course constituted a proper exception so far as respects credibility; but instead of receiving the testimony subject to a proper discrimination as to its effects, courts relieved themselves of all embarrassment in determining its relative weight, by wholly excluding the testimony of an interested witness. Under this rule not only the parties to the action, but all persons having an interest in the result, were, as a general rule, adjudged incompetent to testify. In determining, however, the nature of the interest which should constitute a disqualification, it was found exceedingly difficult to fix precise rules of general application, and much conflict was involved in the decisions. Finally it was settled that the interest must be a direct gain or loss by the operation of the judgment in the action, or that the record would be evidence for or against the witness in some other action. But no interest other than pecuniary was sufficient to exclude, and therefore near relatives might testify for each other even in the most serious cases, and where the temptations to shield them
by untruthful statements might be the strongest possible. But husband and wife were not admitted to testify for or against each other, for which two reasons were principally assigned: 1, that it would tend to destroy the domestic harmony; and 2, that the wife was under such coercion of the husband as would be likely to lead her to distort or suppress the truth. An exception, from the necessity of the case, was made of prosecutions for injuries done or threatened by one against the other. The conviction at length became general that the exclusion of witnesses on account of interest worked injuriously, and accordingly, both in England and the United States, the system has been virtually abrogated. By statute 8 and 4 William IV., c. 42, it was provided that no person offered as a witness should be excluded on the ground that the verdict or judgment in the action could be used for or against him. The act 6 and 7 Victoria, c. 86 (1848), provided that no one, except a party, or the husband or wife of a party, should be excluded from testifying on the ground of interest in the subject of the action or event of the trial. The act 14 and 15 Victoria, c. 99 (1851), enacted that parties and persons on whose behalf a suit is brought or defended shall be competent and compellable to testify as witnesses for either party, except that in criminal proceedings for an indictable offence neither the party charged nor the husband or wife of such party could be a witness; and except also that the provision should not apply to actions founded upon adultery, or for a breach of promise of marriage. By a subsequent act, 16 and 17 Victoria, c. 83 (1859), the husband or wife of a party in a civil action was made competent as a witness except in cases of adultery, but with the qualification that such witness should not be bound to disclose any confidential communication made by either to the other during marriage. In the United States similar provisions have very generally been adopted; and as a rule all persons having knowledge of material facts are competent and compellable to testify, except husband and wife against each other, and the defendants in criminal proceedings. The former, however, are allowed to be witnesses for each other, and by consent may be called by the opposite party. In a number of the states the defendants in criminal cases are allowed either to testify in their own behalf under oath, or to make a statement without oath which the jury may receive as evidence; but constitutional provisions forbid their being compelled to testify against themselves.—The third of the classes into which we have divided the rules of evidence consists of presumptions of law in lieu of actual proof, or of what could be proved, under which may be specified the following: a. The statutes of limitation, by which a period of time is fixed when a debt shall be presumed to have been paid, or satisfaction to have been received. This sort of presumption is made not for want of actual proof, as the period is usually short, but to put an end to controversy within a reasonable period. The current business of life has enough to employ our attention without our being burdened with the memory of all former transactions. (See Limitation, Statutes of.) b. Estoppels. A man is said to be estopped when it would be inconsistent with good faith or with the policy of the law to allow him to deny a certain fact or legal conclusion. Thus, if he claims under a deed or will, he is bound by all that is contained in it, and is estopped either from denying any recital therein, or from setting up any claim of title adverse to or inconsistent with such deed or will. An estoppel in pais, as it is called in the old cases, is when a man is precluded by his own act or admission from proving anything contrary thereto. An instance of this is when a man has by some statement or admission induced another with whom he was dealing to enter into a contract; he will not afterward be permitted to deny the truth of such statement or admission if the effect would be to work an injury to such third party. So a tacit admission, as when the owner of a chattel stands by while another sells it as his own, and neglects to give notice of his right; this will operate as an estoppel to his setting up his claim against the innocent purchaser. To this head also belongs what is called res judicata, that is to say, the rule that when a fact necessarily involved in an action is once determined it shall not afterward be called in question as between the same parties or persons claiming under them. A judgment or decree of a competent court is final not only as to what was actually determined, but as to every matter which was involved in the issue, and which could have been decided. The record of the judgment is the only proper evidence of what was in issue, and it cannot be proved aliunde that some matter was in fact involved and taken into consideration which does not appear by the record to have been involved in the issue. This is the rule as to decisions of tribunals in our own country. In respect to foreign judgments and decrees, the effect is the same when the court had jurisdiction of the case, and no fraud has been practised. The record itself, which must be produced, is not conclusive as to facts necessary to give jurisdiction, and a defendant will be permitted to prove that he was not personally served with process; so any fraud on the part of the court or its officers may be shown. But the regularity of the judgment having been established, it is conclusive upon all matters embraced in the issue.—The fourth class in the arrangement we have made of our subject, viz., the comparative weight of evidence, is of a twofold character. Judicial discrimination may lead to the rejection of testimony as being entitled to no weight at all, or it may determine the relative influence which it should have if admissible in the decision of a question of fact. The former we have already considered, so far as respects
the incompetency of witnesses and the exclusion of hearsay testimony. But evidence is sometimes excluded for reasons of more limited application. Thus, inferior testimony is not admitted when a party has it in his power to produce what is of a higher order; as if the question be as to the title to real estate derived from a deed, the best proof will of course be the production of the deed itself, and no other proof will be admitted as a substitute, unless a satisfactory reason is given for its non-production, as where it has been lost or destroyed. But in this case, the substituted evidence must be exclusively as to the contents of the deed. But where under statutes providing therefor conveyances of real estate are recorded, the record or a certified copy is allowed to be read in evidence with the same effect as the original.

So when a contract is in writing, it is necessary to produce the writing itself, and no other evidence can be given of the terms of such contract, without showing first the loss of the writing; or that for some other satisfactory reason it is impracticable to produce it; upon making which proof, parol evidence may be given as to the contents. And whenever, in the course of a trial, a fact comes in question, the evidence of which is in writing, the same rule is applied, viz., that no other evidence can be admitted than the writing itself if in existence, and if not, then only the substituted proof of its contents. It may however happen that nothing more than the purport can be shown, and not the exact phraseology; and some latitude will be allowed in such case, as by admitting proof of the acts of parties, and other circumstances, but still having in view to get at what was expressed by the writing. It does not follow, however, that when the best or what is called primary evidence cannot be produced, inferior or what is called secondary evidence will in all cases be admitted. Thus, hearsay evidence is in general excluded, even if none better can be procured. Upon the same principle, when a writing is put in evidence, it must have effect according to its terms, and parol evidence is not admissible to give it a different construction, or to defeat its operation according to the import thereof; or even if the writing is ambiguous, it cannot be explained by other evidence, if the ambiguity is intrinsic, that is, if the phraseology is per se doubtful. But if the ambiguity arises from something referred to but not fully expressed in the writing, explanation by other evidence is admissible. The latter is designated in law as a latent ambiguity, by which is meant that it does not appear upon the face of the instrument, but arises from something extrinsic. So also, when parties to a contract have undertaken to express it in writing, it will be assumed that they have expressed the whole, and nothing can be added by parol evidence, so far as relates to what the parties had in view at the time the contract was made. This is in effect saying that the written contract must speak for itself, and will be presumed to contain all that was intended at the time, though this contract may be varied by a subsequent parol agreement for good consideration. To the general rule as above stated there are, however, some qualifications. 1. It is admissible to explain the subject of the contract and all the circumstances which may properly be supposed to have been had in view by both parties, for the purpose of understanding the phraseology which they may have used. 2. Terms peculiar to a science, profession, art, or trade may be explained by witnesses conversant therewith. 3. Parol evidence is admissible to impeach a written instrument, by showing fraud, illegality of the subject matter, or whatever would operate in law to avoid it.—The admissibility of evidence is in judicial proceedings a matter of law, and in jury trials is determined by the court. But it is not alone for this purpose that discrimination is required. A question of fact usually involves testimony on both sides, which must be collated, and the relative weight of which must be determined in order to reach a correct conclusion. Usually the court arranges and sifts the evidence in the instructions given to the jury, and it is obvious that without this aid the jury would be incompetent to analyze the evidence in a complicated case. Since the disqualification to testify by reason of interest has been abolished, the reasons which formerly were insisted upon as grounds of such disqualification are still proper to be considered with reference to the credit of the witness. It would be out of place to discuss these reasons at large in the brief summary of principles to which this article is necessarily limited. A single case may however be appropriately referred to, viz., the impeachment of a witness by direct testimony of other witnesses, showing that he is unworthy of credit. This kind of testimony is peculiar. The inquiry is limited only to the general reputation of the witness whose veracity is in question, and the impeaching witness is not allowed to testify to particular facts. The usual course of examination is to inquire what is the general reputation of the witness as to veracity, and formerly it was permitted then to ask the impeaching witness whether he would believe the other under oath, but the authorities are in this country not altogether uniform as to the latter practice. It may not be improper here to say that the rule as to impeachment of a witness is seldom of use, except where he is notoriously destitute of principle. A witness is also allowed to be impeached by showing that he has made out of court statements contradictory to his evidence in court; but before these are permitted to be shown his attention is called to them, that he may have opportunity for explanation.—We have thus briefly analyzed the general principles of the law of evidence. Our subject would however be imperfectly treated if we should not refer to some of the rules which have more particular relation to
the practice of the courts. One is that the best evidence must always be produced; or in other words, the inferior evidence will not be received when a party has it in his power to produce better. But it does not follow, as before remarked, that when a party has not the power to produce the best, any other without restriction is admissible. The secondary proof must still be such as is held competent under other rules, or it will be rejected. The meaning of the rule is that inferior evidence, although otherwise competent, shall not be admitted when better can be had. We have before adverted to the distinction between writings or documentary proof, and oral or, as it is usually called, parol evidence. The distinction is founded upon the uncertainty of memory. Whatever has been put in writing can never be proved by mere recollection with perfect exactness; the writing itself is of course the most trustworthy, and according to the rule above mentioned it must be produced or its loss proved before its contents can be shown by other evidence; and this is true whether the writing relates to the principal fact or subject of the action, or is merely incidental. Again, when the question is as to a fact respecting which there is evidence in writing, but an offer is made to prove the fact by evidence admissible without producing the writing or proving its contents, the rule is that if the writing was the concurrent act of both parties, as if it was signed by them or was prepared with the privity of both as an expression of their mutual understanding, it is thereby constituted the primary evidence of the fact to which it relates, and must be produced. This includes not merely a written contract which is the subject of the action or defence, but any other writing which the parties have agreed upon as the expression of any fact incidentally involved in the action. There is this difference, however, between the two cases: that in the former no other proof can be received but the instrument itself, or if lost, proof of its contents; whereas in the latter there may be other evidence bearing upon the same point which is admissible, together with the writing, and in some instances without it, where it is not intentionally withheld. Thus a written correspondence between the parties may be material to show their understanding in respect to some transaction, but this would not preclude proof of conversations or other acts. If, however, the correspondence contains a contract, then, according to another rule, no other evidence can be received except what is necessary for the proper explanation of the meaning of the parties in the language used by them. It is not material which party has possession of the writing; the rule is the same in either case. If wanted by one party, and the other has possession of it, upon notice by him to the other to produce it, and its non-production, he may give parol evidence of its contents. It is to be understood that the rule above mentioned applies only to a writing in which both parties have concurred. When it is a memorandum by one without the privity of the other, it cannot be evidence at all, except under the recent modification of the law of evidence allowing parties to be witnesses, and is subject to the same rule that applies to any other witness. The rule as to a memorandum made by a witness at the time of the transaction referred to in it, that he may refer to it for the purpose of refreshing his memory, but having done so, he is to testify what with this aid he is able to recollect. But if he has no recollection independent of the memorandum, the later doctrine is that on proving that it was made at the time of the transaction referred to, and that he then had knowledge of the subject, the memorandum itself may be put in evidence. The mode of proving a writing which is attested by a subscribing witness is peculiar. In such a case the subscribing witness must be called if living and within the jurisdiction of the court; but if dead or absent from the country, proof of his handwriting or that of the party will be sufficient to make the instrument evidence. The exclusion of proof of execution by any other person than the subscribing witness has often been the occasion of inconvenience; and the reason usually assigned for it, viz., that the subscribing witness is supposed to have some knowledge of the subject which another would not have, is certainly very singular, as if he had such knowledge he would not be allowed to testify to it, if it would at all vary the effect of the instrument. In England, by acts 17 and 18 Victoria, c. 125 (1854), a subscribing witness to an instrument which is not required by law to be attested need not be called, but the instrument may be proved in the same manner as if there was no such witness. The rule that parol evidence is not admissible to contradict, vary, or explain a written instrument has been before referred to, and certain exceptions or qualifications were mentioned; but it should be added that in a proper proceeding instituted to reform the instrument, it may always be shown that, through accident, mistake, or fraud, it was not made to express the real intent and contract of the party. Such a proceeding must be in chancery, except where the common-law courts are vested with equity jurisdiction.—In the examination of witnesses, a very different mode is prescribed to the party calling a witness from what is allowed to the opposite party. The counsel of the former must not put leading questions, and if the witness should make adverse or unsatisfactory answers, still he was deemed the witness of the party and could be examined only in accordance with that theory; that is to say, he could not be cross-examined by such party. This at least was formerly the rule, but it has recently been relaxed so far as to allow him to be treated to some extent as an adverse witness, when it is apparent that he is so. On the other hand, cross-examination by the other
party is allowed to an almost unlimited extent, and the privilege is often used to pervert rather than elicit the truth. It would be difficult to fix a precise limit of restriction, as it necessarily rests very much in the discretion of the court; but the prevailing practice seems to be suited rather to a remote period, when from the disorders of society and consequent laxity of moral principle there was little reliance to be placed on the oath of witnesses, than to the present advanced state of social order.

**Evolution**, the term now generally applied to the doctrine that the existing universe has been gradually unfolded by the action of natural causes in the immeasurable course of past time. The question how the present order of things originated seems natural to the human mind, and has been put by all the races of men. The answer given in their cosmogonies, that it was created as we now see it by supernatural power, has been generally accepted as a matter of religious faith. The early Greek philosophers first brought the question into the field of speculation, and taught that all natural things have sprung from certain primal elements, such as air, water, or fire. As regards the origin of life, Anaximander is said to have held that animals were begotten from earth by means of moisture and heat, and that man did not originate in a perfectly developed state, but was engendered from beings of a different form. Empedocles taught that the various parts of animals, arms, feet, eyes, &c., existed separately at first; that they combined gradually, and that these combinations, capable of subsisting, survived and propagated themselves. Anaxagoras believed that plants and animals owe their origin to the fecundation of the earth whence they sprang by germs contained in the air. Aristotle, the father of natural history, entertained much more rational views upon the subject, and it is maintained that he held opinions as to the causes of diversity in living beings similar to those that are entertained by the latest zoologists. It has been asserted that some of the early theologians, including St. Augustine and St. Thomas Aquinas, announced doctrines that harmonize apparently with the modern views of evolution. We however find no development of the ideas thus shadowed forth. Linnaeus and Buffon seem to have been the first among modern naturalists who formed definite conceptions of a progressive organic development, but they did little to elucidate the idea. Immanuel Kant announced in 1755 his theory of the mechanical origin of the universe, and supposed that the different classes of organisms are related to each other through generation from a common original germ. Dr. Erasimus Darwin, grandfather of Charles Darwin, in his *Zoonomia* (1794), maintained the natural genesis of organic beings. But the first to frame a distinct hypothesis of development was Lamarck, who published his *Philosophie zoologique* in 1809, and developed his views still further in 1815 in his *Histoire naturelle des animaux sans vertebrae*. He held that all organic forms, from the lowest to the highest, have been developed progressively from living microscopic particles. Similar conclusions were arrived at by Goethe in Germany, and by Geoffroy Saint-Hilaire in France in his work *Sur le principe de l'unite de composition organique*, published in 1828. The views thus far were of a general and highly speculative nature, and without firm scientific ground-work. It was only when the question was narrowed down to that of the mutability or immutability of species, and to the causes and extent of variation as determined by observation and experiment, that the real difficulties of the case were grappled with, and the inquiry assumed a strictly scientific character. In 1818 Dr. W. C. Wells read a paper before the London royal society, in which he recognized distinctly the principle of natural selection as applied to certain races of mankind. In 1829 the Rev. William Herbert, afterward dean of Manchester, declared his conviction that “botanical species are only a higher and more permanent class of varieties;” and he extended this opinion to animals. Leopold von Buch, in his *Physikalische Beschreibung des Canarischen Insels* (1825), expresses the opinion that varieties change gradually into permanent species, which are no longer capable of intercrossing. In 1829 Prof. Grant of Edinburgh published a paper on the *Eponilla* in the “Philosophical Journal,” in which he held that species are descended from other species, and that they become improved in the course of modification. Karl Ernst von Baer, in his *Ueber Entwicklungs geschichte der Thiere* (1828), maintains similar views as to animals. Oken, in his *Naturphilosophie* (1840), published his belief in the development of species; and in 1846 J. d’Omalour d’Halloy of Brussels expressed his opinion that probability favors this theory rather than that of separate creations. Isidore Geoffroy Saint-Hilaire, in his lectures published in 1850, gives reasons for his belief in the modification of species by circumstances, and in the transmission of differences thus produced. In 1852 Herbert Spencer argued that species have undergone modification through change of circumstances. M. Nau din in the same year published a paper on the origin of species in the *Revue horticulte*, in which he averred his belief that botanical species are formed in a manner analogous to varieties under cultivation; and Franz Unger, also in 1852, expressed similar opinions in his *Versuch einer Geschichte der Pflanzen welt*. In 1853 Dr. Schaffhausen, in a paper published in the *Verhandlungen des Naturhistorischen Vereins des preussischen Rheinlands*, &c., maintained the doctrine of progressive development of organic forms. On July 1, 1858, two essays were read before the Linnaean society, one by Charles Robert Darwin, entitled “On the Tendency of Species to form Varieties, and on the Perpetuation of Species and Varieties by
means of Natural Selection;" the other by Alfred Russel Wallace, entitled "On the Tendency of Varieties to Depart Indefinitely from the Original Type." These papers showed that these two naturalists had arrived at almost exactly the same general conclusions; but the priority may safely be assigned to Darwin, who, although he had not previously made public his views, had submitted a sketch of them as early as 1844 to Sir Charles Lyell, Dr. Hooker, and others. In 1859 he published the treatise entitled "On the Origin of Species by means of Natural Selection," which was the means of diffusing so widely the theory, elaborated by him through years of patient and careful investigation, that it is commonly designated by his name. In this work he did not apply the doctrine of evolution to the human race, although he had long held the opinion that man must be included with other organic beings; and it was not until after Huxley, Spencer, Lyell, Lubbock, Gegenbaur, Vogt, Rolle, Haeckel, Oerstedtini, Francesco, and others, had accepted the extreme conclusion, that he published "The Descent of Man, and Selection in Relation to Sex" (1871). In 1873 Haeckel, who previously had discussed the genealogy of man in "Naturliche Schopfungsgeschichte" (1868), published his "Monographie der Kälttuchthiere," in which he claims to give an analytical demonstration of the problem of the development of species. The theory as now generally held is thus stated by Prof. Huxley: "Those who hold the theory of evolution (and I am one of them) conceive that there are grounds for believing that the world, with all that is in it, did not come into existence in the condition in which we now see it, nor in anything approaching that condition. On the contrary, they hold that the present conformation and composition of the earth's crust, the distribution of land and water, and the infinitely diversified forms of animals and plants which constitute its present population, are merely the final terms in an immense series of changes which have been brought about, in the course of immeasurable time, by the operation of causes more or less similar to those which are at work at the present day." The idea expressed by the term development involves the same principle, but it is usually restricted to the evolution of organic beings. We will first consider the doctrine as applied to the development of the various forms of life, and then in its broader aspects as a theory of universal evolution.—It has been proved by geology that the earth and its life, instead of being called suddenly into existence a few thousand years ago, have existed for millions of years; and as the mountains and continents are known to have attained their present form by the action of natural agencies, it is thought probable that other objects of nature have been produced in a similar way. The earth has teemed with living beings through incalculable periods of time, and fossil remains of them are found distributed through the rocky layers that have been successively formed, until the natural walls are of thickness. But not all kinds of animals and plants existed from the beginning, leaving their mingled remains in the lowest strata; the lowest types of life, vegetable and animal, appeared first. The successive phases of life are so definite that they have been held as marking off the earth's history into a series of ages. The invertebrates (radiates, mollusks, and articulate) are found in the Silurian or oldest stratified rocks; and from the predominance of the mollusks the period has been called the age of mollusks. Fishes, which are higher in the scale, begin to appear in the Silurian, but become so abundant in the later Devonian period that it is called the age of fishes. Amphibious animals, as an advance on the fishes, appear in the carboniferous age, which again is followed by the age of reptiles. To this succeeds the age of mammals, and lastly comes the age of man, the series, which began with the lowest forms of life, terminating with the highest. That the order has been progressive, and that its lower terms have been more general in character, while the later terms have been more specialized and perfect, is admitted by all naturalists. Prof. Owen says: "In regard to animal life and its assigned work on this planet, there has been an ascent and a progress in the main;" and he has "never omitted a proper opportunity for impressing the results of observation showing the more generalized structure of extinct as compared with the more specialized forms of recent animals." Prof. Agassiz holds that "the more ancient animals resemble the embryonic forms of existing species," that is, are lower in the scale of development than the later forms. Mr. Wallace remarks: "As we go back into past time and meet with the fossil remains of more and more ancient races of extinct animals, we find that many of them are actually intermediate between distinct groups of existing animals;" the ancient fishes, for example, present unmistakable reptilian traits, while the early reptilians combined also the characters of birds which had not yet appeared. As regards the continuity of the course of life, Prof. Dana remarks: "Geological history is like human history in this respect; time is one in its course, and all progress one in plan. . . ." The germ of the period was long working onward in preceding time, before it finally came to its full development and stood forth as a characteristic of a new era of progress. . . . The beginning of an age will be in the midst of a preceding age; and the marks of the future, coming out to view, are to be regarded as prophetic of that future. The age of mammals was foreshadowed by the appearance of mammals long before in the course of the reptilian age, and the age of reptiles was prophesied in the types that lived in the earlier carboniferous age." The animal kingdom displays a
unity of plan or a correlation of parts by which common principles are traced through the most rigorous diversity of form, so that in aspect, structure, and functions the various tribes of animals pass into each other by slight and gradual transitions. The arm of a man, the forelimb of a quadruped, the wing of a bird, and the fin of a fish are homologous; that is, they contain the same essential parts modified in correspondence with the different circumstances of the animal; and so with the other organs. Prof. Cope says: "Every individual of every species of a given branch of the animal kingdom is composed of elements common to all, and the differences which are so radical in the higher grades are but the modifications of the same elemental parts." There are many cases of rudimentary and useless organs in animals and plants. During the development of embryos organs often develop to certain points, and then are reabsorbed without performing any function, although generally the partially developed organs are retained through life. Certain snakes have rudimentary hind legs hidden beneath the skin; the paddle of the seal has toes that still bear external nails; some of the smooth-skinned amphibians have scales buried under the dermal surface; rudimentary teeth have been traced even in birds; and there are rudimentary eyes in cave fishes and rudimentary mammary glands in men. Classification is an arrangement of living beings by related characters. In the earliest attempts the organic tribes were arranged in a serial order or a chain from the bottom to the top of the scale; but this has been abandoned, as also have those symmetrical systems which assumed that the characters of different groups are equivalents of each other. The endeavor to thrust animals and plants into these artificial partitions is of the same nature as the endeavor to arrange them in a linear series; and it assumes a regularity which does not exist in nature. Classification now represents the animal kingdom as consisting of certain great sub-kingdoms very widely divergent, each made up of classes much less widely divergent, severally containing orders still less divergent, and so on with genera and species, like the branches of a growing tree; and the old method of classification, as Mr. Spencer remarks, involves exactly the difficulty "which would meet the endeavor to classify the branches of a tree as branches of the first, second, third, fourth, and fifth orders; the difficulty, namely, that branches of intermediate degrees of composition exist." There is a remarkable analogy between the present distribution of animals in space over the earth and their past distribution in time as we trace their fossils in the successive geological formations. The larger groups, such as classes and orders, are generally spread over the whole earth, while smaller groups, such as families and genera, are commonly confined to limited districts; but when a group is restricted to one region, and is rich in the minor groups called species, it is almost invariably the case that the most closely allied species are found in the same locality or in closely adjoining localities. The same fact is seen in geological distribution. Mr. Wallace observes: "Most of the larger and some smaller groups extend through several geological periods. In each period, however, there are peculiar groups, found nowhere else, and extending through one or several formations. As generally in geography no species or genus occurs in two very distant localities without being also found in intermediate places, so in geology the life of a species or genus has not been interrupted. In other words, no group or species has come into existence twice." From these facts Mr. Wallace deduces the following important law: "Every species has come into existence coincident both in space and time with a preexisting closely allied species." The adherents of development maintain that these facts, and many others of kindred significance, are only to be explained by the continuous operation of a great natural law of descent and divergence by which the present life of the earth has been derived from its preexisting life. That the numberless forms of life should have been held as independently created, so long as the earth was regarded as having been recently and suddenly called into existence, was inevitable; but now, when it is known that the order of nature is extended backward into immeasurable time, the supposition that species were called into existence by hundreds of thousands of separate and special creations, running through the geological ages, and as we approach our own epoch suddenly and unaccountably ceasing, is held to be an unwarranted assumption which science can no longer accept. As remarked by the Rev. Baden Powell: "The introduction of a new species is part of a series. But a series indicates a principle of regularity and law, as much in organic as in inorganic changes. The event is part of a regularly ordained mechanism of the evolution of the existing world out of former conditions, and as much subject to regular laws as any changes now taking place. If the series be regular, its subordinate links must each be so; the part cannot be less subject to law than the whole. That species should be subject to exactly the same general laws of structure, growth, nutrition, and all other functions of organic life, and yet in the single instance of their mode of birth or origin should constitute exceptions to all physical law, is an incongruity so preposterous that no inductive mind can for a moment entertain it." This is the ground taken by the great majority of contemporary naturalists. They believe in evolution in some form as a great fact of nature; but many think that we know nothing as to how it has been brought about, while others hold that the problem of the modes and causes of evolution, although obscure, is no more barred from successful investigation than are the other
phenomena of nature.—The following facts have been offered as throwing light upon the way in which the diversities of life have originated. Organisms being differentiated in their modifiability. They are capable in various degrees of adaptation to new conditions. Plants taken from their native situations and cultivated in gardens undergo changes so great as often to render them no longer recognizable as the same plants. The muscles are strengthened by exercise and the skin thickened and hardened by pressure, while the bones of men who put forth great physical exertion are more massive than the bones of those who do not labor. In the words of Mr. Spencer: "There is in living organisms a margin of functional oscillations on all sides of a mean state, and a consequent margin of structural variation." These variations may become fixed through the law of hereditary descent. It is the law of transmission of characters which preserves species and varieties from generation to generation, oaks being always derived from oaks and dogs from ancestral dogs. It is not only the normal qualities that are perpetuated, but malformations, diseases, and individual peculiarities are also transmitted. While offspring tend to grow in the likeness of parents, they also tend to grow in unlikeliness; while moulded upon the parental type, the resemblance is usually imperfect. Nor are variations confined to any particular organs or characters, but they may be manifested by every part, quality, or instinct of the creature. These divergences may be selected and fixed by breeding so as to give rise to new kinds or varieties. Nature begins the variation, art secures its perpetuation and increase. How profound are the modifications that may be thus produced is shown in the numerous breeds of dogs, all of which belong to the same species. Not only have they reached extreme diversities in size (the largest being, according to Cuvier, 100 times larger than the smallest), but in muscular, bony, and nervous development, in form, strength, fleetness, and variety of instinct and intelligence, their divergences are almost equally remarkable. Domestic pigeons afford another example of the great plasticity of the living organism, by which it can be moulded into the extremest diversities. Naturalists believe that from a single species, the wild rock pigeon, there have arisen no fewer than 150 kinds that breed true or hold to the variety; and how deep have become the differences among them is thus stated by Prof. Huxley: "In the first place, the back of the skull may differ a good deal, and the development of the bones of the face may vary a good deal; the beak varies a good deal; the shape of the lower jaw varies; the tongue varies very greatly, not only in correlation to the length and size of the beak, but it seems also to have a kind of independent variation of its own. Then the amount of naked skin round the eyes and at

the base of the beak may vary enormously; so may the length of the eyelids, the shape of the nostrils, and the length of the neck. I have already noticed the habit of blowing out the gullet, so remarkable in the pouter, and comparatively so in the others. There are great differences, too, in the size of the female and the male, the shape of the body, the number and width of the processes of the ribs, the development of the ribs, and the size, shape, and development of the breast bone. We may notice, too (and I mention the fact because it has been disputed by what is assumed to be high authority), the variation in number of the sacral vertebrae. The number of these varies from 11 to 14, and that without any diminution in the number of the vertebrae of the back or of the tail. Then the number and position of the tail feathers may vary enormously, and so may the number of the primary and secondary feathers of the wings. Again, the length of the feet and of the beak, although they have no relation to each other, yet appear to go together; that is, you have a long beak wherever you have long feet. There are differences also, in the periods of the acquirement of the perfect plumage, the size and shape of the eggs, the nature of flight, and the powers of flight, so-called 'homing' birds having enormous flying powers; while on the other hand, the little tumbler is so called because of its extraordinary faculty of turning head-over-heels in the air, instead of pursuing a distinct course. And lastly, the dispositions and voices of the birds may vary. Thus the case of the pigeons shows you that there is hardly a single particular, whether of instinct or habit, or bony structure, or of plumage, of either the internal economy or the external shape, in which some variation or change may not take place, which by selective breeding may become perpetuated and form the foundation of and give rise to a new race." Nor is this variation confined to domestic animals. Wild species both of plants and animals vary, become diversified, and give rise to new varieties. As many as 28 varieties of oak have been made out within the limits of a single species. The wolf species exhibits some 15 varieties, and lions, tigers, bears, hyenas, foxes, birds, reptiles, and fishes all exhibit marked varieties, which show that wild species undergo modification in a state of nature. What was needed was to make out the analogy of variation between wild and domesticated animals was to discover some process in nature which is the equivalent of human agency in breeding. Mr. Darwin believes that he has discovered this process, and calls it the principle of "natural selection." He says that living beings in a state of nature are subject to certain external conditions, such as climate, situation, character of soil, and exposure to enemies, by which they are surrounded and limited. They are endowed with enormous powers of increase, so that any one of the hundreds of thousands of species of plants or animals, if all
its progeny were preserved, would go on multiplying until it covered the earth or filled the sea. Space is fixed and food limited, and the consequence is a universal conflict, the war of races; and in the "struggle for existence" multitudes perish and comparatively few survive. This survival is not a matter of chance. Mr. Darwin maintains that it is regulated by law, and that those only survive which are in some way best adapted to the conditions of life. The strongest, the swiftest, the most cunning, and the best adapted to the conditions will live and multiply, while the less fit will disappear. The introduction of European plants and animals into New Zealand affords an instructive example of how races encroach on each other's area, the weaker being extinguished by the stronger in the competition for existence. Dr. Hooker says: "The cow grass has taken possession of the roadsides; dock and water cress choke the rivers; the sow thistle is spread over all the country, growing luxuriantly up to 6,000 feet; white clover in the mountain districts displaces the native grasses; and the native (Maori) saying is: "As the white man's rat has driven away the native rat, as the European fly drives away our own, and the clover kills our fern, so will the Maoris disappear before the white man himself." Mr. Darwin in his works gives a great number of facts showing how apparently trifling variations give advantages to their possessors, which determine their survival and become perpetuated in the race. The principle of natural selection, or, as it is termed by Herbert Spencer, the "survival of the fittest," is now generally recognized as a genuine agency or vera causa, and the opponents of development admit that it may give rise to varieties, although they deny that it is competent to produce the deeper diversities of species. The extent of its operation remains yet to be determined, but many naturalists agree with Prof. Helmholz that Mr. Darwin has contributed to science an "essentially new creative idea." Mr. Darwin, however, does not assume to be the discoverer of the principle of natural selection, and he points out that others before him have recognized the action of the process, though without seeing its full significance. What he claims is to have first shown the efficacy of the principle in producing divergency of types under the laws of variation and heredity. But having discovered a new factor in organic development, and published his work on the "Origin of Species" at the fortunate moment when naturalists had become widely dissatisfied with the old views, he became prominently identified with the development doctrine, and this has led many into the error of regarding Darwinism as the equivalent of evolution, of which, as we are now to see, it is but a minor part. — The advance of civilization in the historical period gave rise to the modern idea of progress, which was strengthened by the discoveries made early in the present century concerning the past course of terrestrial life. The process was crudely conceived, in the one case as the successive development of all living creatures in a graded and linear series, and in the other case as the continuous movement of humanity toward a state of final perfection. About the year 1860 Mr. Herbert Spencer entered upon the systematic study of the subject. The problem was strictly a scientific one, and he had a wide and accurate preparation for it by a mastery of scientific knowledge which Mr. Mill has pronounced "encyclopedic." Mr. Spencer was also remarkable for his power of analysis, his grasp of wide-reaching principles, and his independence of opinion. The essence of progress is change. Mr. Spencer asked what, then, are the laws of change by which it is effected? Complying with the Newtonian canon that the fewest causes possible are to be assumed in the explanation of phenomena, he took up the question as resolvable in terms of matter, motion, and force. Progressing along a theory of the successive changes by which things are produced, his task was to ascertain the dynamical conditions or laws under which the forms of nature rise, continue, and disappear. The objects of nature coexist and are maintained in a certain order in space. Newton discovered that this is effected by the operation of a simple and universal law. The objects of nature undergo changes in time, emerging and vanishing, some quickly and others slowly: is there a universal law by which these changes also are governed? This was the aim of the research. Mr. Spencer early found that the conception of progress which implies movement in one direction only is erroneous. There is no unbroken march of events; breaks and regressions alternate with advancement, and descending as well as ascending changes have to be accounted for. He therefore rejected the term progress as having erroneous implications, and adopted the term evolution, as more fully indicating the scope of the inquiry and better expressing the strictly scientific nature of his theory. The naturalist Von Baer had already attempted to define and generalize the changes of organic growth, and had formulated them as from the homogeneous germ state to the heterogeneous adult state by a process of differentiation. Mr. Spencer soon found that this formula gave but a very partial account of what takes place in organic development. The change was shown to be not only from uniformity to likeness, or a differing of parts, but from the indefinite to the definite, from the incoherent to the coherent, producing the integration of parts, or increasing unity with increasing complexity. The conditions and course of changes in which organic evolution consists being ascertained, the question arose as to their extent, and Mr. Spencer became convinced that the law of organic movement is not an isolated fact in nature, but "that the process of change gone through by
each evolving organism is a process gone through by all things." Science had shown that the universe, past and present, is subject to orderly changes; he discovered that fundamentally this order is one. The nebular hypothesis proposed by Kant, confirmed by Herschel and Laplace, and accepted by astronomers, explained the origin and motions of suns and planets by slow condensation from a nebulous mist diffused through space. The geological history of our earth shows that it has undergone a vast series of progressive changes, and, as Prof. Dana says, "was first a featureless globe of fire, then had its oceans and dry land, in course of time received mountains and rivers, and finally all those diversities of surface which now characterize it." The course of organic life, as we have seen, was a progressive unfolding into greater diversity and variety. Mind is developed with the body, and therefore mental phenomena obey a law of unfolding. As human society is made up of units that are capable of these changes, it presents in the past a gradual development of intelligence, arts, and institutions, as now embodied in our diverse and complex civilization. By a careful analysis of the phenomena in these widely separated cases, Mr. Spencer showed that they all conform to a great general law, of which individual life is but a special case. Equally in the inorganic, the organic, and the super-organic spheres, the progressive changes are from the homogeneous to the heterogeneous by differentiation. But with increasing divergences there is also increasing definiteness, coherence, complexity, and integration. Evolution is thus a universal law, while the development of the individual and the career of the race, so far from being exceptional phenomena, are but parts of the great system of change to which the whole cosmos conforms. Evolution being thus disclosed as a universal dynamical law, the question next arises, how is it to be interpreted? Is it an ultimate law like gravitation, or is it a derivative principle deducible as a necessity from the established laws of matter, motion, and force? Mr. Spencer proves that evolution is a resultant of dynamical agencies, and that, given matter as a vehicle of change, motion as the result of change, and force as the cause of change, such are their established laws of interaction that evolution follows as an inevitable consequence. We can here only touch upon the leading elements of the elucidation, and must refer the reader to Mr. Spencer's "System of Philosophy" for the full elaboration of the subject. Modern science has established the great principles of the indestructibility of matter and the conservation of force. (See Correlation of Forces) These, therefore, should resolve themselves into the simple law of the persistence of force, and that this is the fundamental postulate of evolution. Whatever interpretation is given to the principle, it certainly becomes a fundamental condition of the changes taking place in nature. If matter and force throughout the universe are neither created nor destroyed, all changes must be changes of transformation. The stock of material and energy being limited, each new effect must be at the expense of something preexisting; and hence in the goings of nature one thing is necessarily derived from another, while the problem of advance becomes one of transmutation. Mr. Spencer traces out the several causes of transformation or factors of evolution, and shows that they are all corollaries from the supreme law of the persistence of force. Briefly indicated, these are as follows:

1. The principle of the rhythm of motion. Under the law of the persistence of forces and the diversity of their forms, there arise constant conflicts of effect, so that motions are not uniform but varying. Action is met by counteraction, and the result is that movements take a rhythmical form. Boughs, for example, sway in the wind, water is thrown into waves, sound arises in vibrations, earthquakes are propagated in shocks, planets swing through eccentric orbits, breathing is recurrent, the heart beats, scarcity alternates with abundance, and prices rise and fall. From the minutest organism throughout the whole frame of things to the most distant systems, from momentary pulses to geological cycles, the agitations of things take the form of thrills and surges, which produce incessant and universal redistributions of matter and force. How are these redistributions directed? 2. They are controlled first by the law of the instability of the homogeneous. The relatively homogeneous is the commencing stage of all evolution, and Mr. Spencer has shown that this is an unstable condition, and under rhythmic disturbance tends constantly to rearrangement and greater complexity. No object can exist without being acted upon and altered by forces, and no mass can be thus acted upon by all parts alike; unequal action therefore tends to destroy homogeneity and produce ever increasing diversity. For this cause the nebulous condition could not continue; the homogeneous germ divides into unlike parts; a class of animals or plants distributed over a geographical area, being unequally acted upon by environing conditions, would fall into diversity; and for the same reason a uniform social condition would be resolved into heterogeneous societies. 3. The transformations of evolution are further explained by the dynamical principle of the multiplication of effects. Throughout all nature simple agencies produce diverse consequences, every impulse of force yielding a multiplicity of results. A simple mechanical collision of two bodies may produce effects of sound, heat, light, electricity, and various chemical and structural changes; an accident to the foot may entail a train of consequences affecting the whole constitution; the upheaval of a continent may produce the most extensive alterations in the life of races;
while an invention like that of the steam engine works its multifarious effects throughout civilization. By this law the principle of the instability of the homogeneous is powerfully reinforced, and the cause of universal movement toward greater diversity is rationally explained. But these modes of action alone could only result in a vague chaotic heterogeneity, and could not account for that orderly heterogeneity in which evolution essentially consists. This finds explanation in the principle of segregation. When a mass is acted upon by forces which promote the redistribution of its parts, its units are not only differentiated and regrouped, but there is a segregation of like units which become separated from the neighboring groups. A familiar example of this is seen in the winnowing process, by which a force applied to a mixed mass brings all the grain together in one place and the chaff in another. The same thing is seen when several salts are dissolved in a liquid, and each crystallizes out by the combination of like chemical molecules. The organism conforms to this principle from its earliest stage of growth, the special elements of the bony, muscular, and nervous systems being withdrawn from the nourishing fluids and segregated in the distinctive parts. We have already seen that natural selection is a winnowing process, by which the unfit are excluded, and the better adapted are separated and preserved. In social development the same thing is seen. Not only are there continual differentiations of groups and classes by which society becomes heterogeneous, but these groups are unified by similarity of occupation, character, taste, and race. Stock brokers cluster in Wall street, and the Mormons segregate in Utah. Thus in all the spheres of change redistribution leads to unification. This is further promoted by the important dynamical law that motion takes place along lines of least resistance. The operation of this principle in inorganic nature is self-evident. Water forms its channels in the direction of least obstacles. Mr. James Hinton has shown that organic growth takes place in obedience to this law, and Mr. Spencer proves that it governs both mental and social changes. This law, in connection with the principle that movement set up in any direction is a cause of further movement in that direction, by which lines of connection become established, goes far to account for that integration of structures and functions which is disclosed in all phases of evolution. But can evolution go on forever, or is it limited? This brings us to the problem by which it is constantly antagonized and always finally terminated, the counter-agency of dissolution. All redistributions of matter and motion are either evolution or dissolution, but neither of these processes ever goes on absolutely unqualified by the other, and the change in either direction is but a differential result of the constituent. Mr. Spencer's formula, to be complete, must embrace both sets of correlative changes, and its determination led him to the following universal law: 6. Every change wrought in an object must be either a transposition of its mass, or a variation of its internal or molecular motion. As it loses this contained or insensible motion, there follows a concentration of the parts and increasing integration; if it acquires insensible motion, there is dispersion of the particles, or disintegration; that is, with concentration of matter there is dispersion of motion, and with absorption of motion there is diffusion of matter. These are the two aspects of the universal metamorphosis, and when approximately balanced there is equilibrium. Evolution is integration; dissolution is disintegration. We have here confined ourselves to the most abstract statement of Mr. Spencer's theory; its concrete applications will be found extensively worked out in "First Principles" and in the biological, psychological, and sociological divisions of his "Philosophical System." As a method of philosophy it aims only to explain phenomena; all phenomena being regarded as manifestations of the unknown power which transcends the reach of thought. Philosophy is regarded as the highest explanation of things, and as each science is unified by its largest inductions, the family of sciences is brought into a completer unity by a law that comprehends them all. Whatever ultimate form the theory of evolution may take, its influence must be powerfully felt in the direction of future inquires; for many who withhold their assent from it as an established truth of nature Nevertheless recognize it as an invaluable working hypothesis. As remarked by Prog. Grove: "The first question is, does the newly proposed view remove more difficulties, require fewer assumptions, and present more consistency with observed facts than that which it seeks to supersede? If so, the philosopher will adopt it, and the world will follow the philosopher, after many days." Mr. Spencer's theory has been clearly summed up by himself in the following propositions: 1. Throughout the universe, in general and in detail, there is an unceasing redistribution of matter and motion. 2. This redistribution constitutes evolution where there is a predominant integration of matter and dissipation of motion, and constitutes dissolution where there is a predominant absorption of motion and disintegration of matter. 3. Evolution is simple when the process of integration, or the formation of a coherent aggregate, proceeds uncomplicated by other processes. 4. Evolution is compound when, along with this primary change from an incoherent to a coherent state, there go on secondary changes due to differences in the circumstances of the different parts of the aggregate. 5. These secondary changes constitute a transformation of the homogeneous into the heterogeneous—a transformation which, like the first,
is exhibited in the universe as a whole and in all (or nearly all) its details: in the aggregate of stars and nebulae; in the planetary system; in the earth as an inorganic mass; in each organism, vegetal or animal (Von Baer's law); in the aggregate of organisms throughout geologic time; in the mind; in society; in all products of social activity. 6. The process of integration, acting locally as well as generally, combines with that of differentiation to render this change not simply from homogeneity to heterogeneity, but from an indefinite homogeneity to a definite heterogeneity; and this trait of increasing definiteness, which accompanies the trait of increasing heterogeneity, is like it exhibited in the totality of things, and in all its divisions and subdivisions down to the minutest. 7. Along with this redistribution of the matter composing any evolving aggregate, there goes on a redistribution of the retained motion of its components in relation to one another; this also becomes step by step more definitely heterogeneous. 8. In the absence of a homogeneity that is neither and absolute, there must be a redistribution of which evolution is some phase is inevitable. The causes which necessitate it are: 9. The instability of the homogeneous; which is consequent upon the different exposures of the different parts of any limited aggregate to incident forces. 10. The transformations hence resulting are complicated by the multiplication of effects: every mass and part of a mass on which a force falls subdivides and differentiates that force, which thereupon proceeds to work a variety of changes, and each of these becomes the parent of similarly multiplying changes; the multiplication of these becoming greater in proportion as the aggregate becomes more heterogeneous. 11. These two causes of increasing differentiation are furthered by segregation, which is a process tending ever to separate unlike units and to bring together like units into servitude, and continually to sharpen, or make definite, differentiation otherwise caused. 12. Equilibration is the final result of these transformations which an evolving aggregate undergoes. The changes go on until there is reached an equilibrium between the forces which all parts of the aggregate are exposed to, and the forces these parts oppose to them. Equilibration may pass through a transition stage of balanced motions (as in a planetary system) or of balanced functions (as in a living body) on to the ultimate equilibrium; but the state of rest in inorganic bodies, or death in organic bodies, is the necessary limit of the changes constituting evolution. 13. Dissolution is the counter change which sooner or later every evolved aggregate undergoes. Remaining exposed to surrounding forces that are unequilibrated, each aggregate is ever liable to be broken down into its component elements or of its contained motions; and its dissipation, quickly undergone by bodies lately animate and slowly undergone by inanimate masses, remains to be undergone at an indefinitely remote period by each planetary and stellar mass, which since an indefinitely remote period in the past has been slowly evolving; the cycle of its transformations being thus completed. 14. This rhythm of evolution and dissolution, completing itself during short periods in small aggregates, and in the vast aggregates distributed throughout space, completing itself in periods which are immeasurable by human thought, is as far as we can see universal and eternal; each alternating phase of the process predominating now in this region of space and now in that, as local conditions determine. 15. All these phenomena, from their great features down to their minutest details, are necessary results of the persistence of force, under its forms of matter and motion. Given these in their known distributions through space, and their quantities being unchangeable either by increase or decrease, there inevitably result the continuous redistributions distinguishable as evolution and dissolution, as well as all those special traits above enumerated. 16. That which persists unchanging in quantity but ever-changing in form, which is among these sensible appearances which the universe presents to us, transcends human knowledge and conception—is an unknown and unknowable power, which we are obliged to recognize as without limit in space and without beginning or end in time. —Besides the works already mentioned, the following are important: Spencer's "First Principles," "Principles of Biology," "Principles of Psychology," "Principles of Sociology," and "Descriptive Sociology" (1860–73); Darwin's "Variation of Animals and Plants under Domestication" (1868); St. George Mivart's "The Genesis of Species" (1871); Huxley's "Man's Place in Nature" (1864), "Lay Sermons" (1870), and "Critiques and Addresses" (1878). The relation of the doctrine of evolution to Christianity is discussed in "The Instinct and the Doctrine of Evolution," by W. W. Snyth (1873); "The Theory of Evolution," by the Rev. E. Henslow (1873); "What is Darwinism?" by Charles Hodge, D. D. (1874); and "The Doctrine of Evolution," by Alexander Winchell, LL. D. (1874).
Paris, in a pleasant valley on the Iton, which flows through the city in three branches; pop. in 1866, 12,820. It is surrounded by gardens, vineyards, and highly cultivated fields. It is the seat of a bishop and of several courts and schools, has a botanical garden, a public library, a museum of antiquities, a large hospital, an insane asylum, and cotton and woollen mills, and is the centre of a large trade in groceries and grain. Among the notable buildings are the abbey church of St. Taurin, dating from the 7th, and the cathedral, from the 11th century. At a little distance from the town was the fine old château of Navarre, founded in the 14th century, which was the residence of Charles Edward Stuart from 1746 to 1748, and of the empress Josephine for some time after her divorce, and was destroyed in 1836.—The town was taken from the Romans by Clovis, and in 892 the Normans captured and sacked it. In 899 it became the capital of a county of its name erected in favor of a son of Richard I., duke of Normandy. It passed into the possession of England with the rest of Normandy, and the name of the Devereux, earls of Essex, was probably derived from it. King John ceded it to Philip Augustus in 1200. In 1298 the county was given to Louis, son of Philip the Bold of France; and in 1328 his son Count Philip became by marriage king of Navarre. The county was confiscated from the son of the latter, Charles the Bold of Navarre, in 1788. In the vicinity, at Viseuil Evreux, excavations have led to the discovery of the remains of a theatre, baths, &c., which are supposed to mark the site of Mediolanum; and many medals and household utensils found here have been deposited in the museum of Evreux.

Ewald, Georg Heinar August von, a German orientalist, theologian, and historian, born in Göttingen, Nov. 16, 1808. In 1831 he was appointed to the chair of philosophy, and afterward to those of oriental languages and theology, at Göttingen. He was one of the seven professors who were dismissed in 1837 on account of their remonstrance against the unconstitutional proceedings of King Ernest Augustus of Hanover. He spent some time in England, and was professor of theology at Tübingen from 1838 to 1848, when he was reinstated in his chair at Göttingen. Among his linguistic works are: Grammatica Critica Linguae Arabicae (2 vols. 8vo, Leipzig, 1831–3); Über das äthiopische Buch Henoch (1854); Ausführliches Lehrbuch der hebräischen Sprache des alten Bundes (6th and enlarged ed., 1856; also abridged, Hebräische Sprachlehre für Anfänger, 3d ed., 1862). His critical writings are very numerous, embracing works on Canticles, "The Poetical Books of the Old Testament," "The Prophets of the Old Testament," "The Three First Gospels," St. Paul.

John, &c. His great historical work is his Geschichte des Volkes Israel bis Christus (3d ed., 7 vols., Göttingen, 1864 et seq.; translated by J. Estlin Carpenter, "History of Israel," vols. i.–v., London, 1869–73). He was the projector of the Zeitschrift für die Kunde des Morgenlands, and edited the Jahrbücher der biblischen Wissenschaft, in which he propounded his theological views. His leaning toward Baru and other adherents of the Tübingen school, with whom he became acquainted during his residence in that city, involved him in many controversies. In 1841 he was ennobled by the king of Württemberg. When Prussia took possession of Hanover in October, 1866, Ewald's fidelity to the extinguished dynasty subjected him to a trial for treason; but he was acquitted, and in May, 1869, he was elected a member of the North German parliament. His latest published works are Das Sendeschreiben an die Hebröer und Jacobs' Rundschreiben (1871), and Sieben Sendeschreiben des neuen Bundes (1871).

Ewald, Johannes. See Ewald.

Ewbank, Thomas, an American writer on practical mechanics, born at Barnard Castle, Durham, England, March 11, 1792, died in New York, Sept. 16, 1870. At the age of 13 he
EWELL, Richard Steedman, a general of the Confederate States of America, born in the District of Columbia in 1829, died at Spring Hill, Tenn., Jan. 25, 1873. He graduated at West Point in 1840, and became lieutenant of dragoons. He served in the Mexican war from 1846 to 1848, and was brevetted as captain for gallant and meritorious conduct in the battles of Contreras and Churubusco. In 1860 he was made a captain in a skirmish with the Apaches. In May, 1861, he entered the Confederate service, and commanded a brigade at the battle of Bull Run. Early in 1862 he was promoted to major general, and commanded a division in Jackson's campaign in the Shenandoah valley. He was conspicuous in the battles of Gaines's Mill, Malvern Hill, and Cedar Mountain, was worsted by Hooker at Bristoe Station, and lost a leg at the second battle of Bull Run. He was made a lieutenant general in May, 1863, and succeeded to the command of Jackson's corps, with which he was present at Gettysburg, the Wilderness, and Spottsylvania Court House. During the siege of Petersburg, being disabled from active service in the field, he had command of the garrison of Richmond. At Sailor's creek, during the Confederate retreat, he was cut off by Sheridan, and surrendered, with 6,000 or 7,000 men, three days before the surrender of Lee at Appomattox. Toward the close of the war he had married a daughter of Judge Schopoul of Tennessee, and subsequently took up his residence in that state, and engaged in stock raising, in which he was very successful.

EWING, John, an American clergyman, born in Nottingham, Md., June 22, 1732, died in Philadelphia, Sept. 8, 1802. He was educated in the college of New Jersey, was tutor in that college and instructor of the philosophical classes in the college of Philadelphia, and in 1759 became pastor of the first Presbyterian church in Philadelphia. In 1773 he visited England, and had interviews with Dr. Robertson, Lord North, and Dr. Johnson; the last of whom, affirming that the Americans were as ignorant as rebellious, said to Dr. Ewing, "You never read. You have no books there." "Pardon me," was the reply, "we have read the 'Rambler.'" When the college of Philadelphia was changed in 1779 to the university of Pennsylvania, Dr. Ewing was placed at its head as provost, and remained in this station together with his pastorate till his death. He was vice president of the American philosophical society, and made several contributions to its "Transactions." His collegiate lectures on natural philosophy (2 vols., 1809) and a volume of sermons were published after his death.

EWING, Thomas, an American statesman, born in Ohio co., Va., Dec. 28, 1759, died at Lancaster, Ohio, Oct. 26, 1871. In his 20th year he left home and worked in the Kanawha salt establishments, until he had laid up money enough to pay for the farm which his father had purchased in 1792, in what is now Athens co., Ohio, and enabled himself to enter the Ohio university at Athens, where he graduated in 1815. He studied law in Lancaster, Ohio, was admitted to the bar in 1816, and practised with great success in the state courts and the supreme court of the United States. In March, 1831, he took his seat in the United States senate. He spoke against confirming the nomination of Van Buren as minister to Great Britain, supported the protective tariff system of Clay, and advocated a reduction of the rates of postage, a recharter of the United States bank, and the revenue collection bill known as the "force bill." In 1834, and again in 1835, as a member of the committee on post offices and post roads, he presented a majority report on abuses in the post office which resulted in the reorganization of that department. He opposed the removal of the deposits from the United States bank, and on Dec. 21, 1835, introduced a bill for the settlement of the Ohio boundary question, which was passed March 11 and June 15, 1836. During the same session he brought forward a bill, which became a law, for the reorganization of the general land office; and on several occasions he opposed the policy of granting preemption rights to settlers on the public lands. He spoke against the admission of Michigan, and presented a memorial for the abolition of slavery and the slave trade in the District of Columbia, which he insisted ought to be re-
ferred, though he was opposed to granting the prayer of the memorialists. In July, 1836, the secretary of the treasury issued what was known as the "specie circular," directing receivers in land offices to accept payments only in gold, silver, or treasury certificates, except from certain classes of persons for a limited time. In December Mr. Ewing brought in a bill to annul this circular, and another declaring it unlawful for the secretary to make such discrimination, but the bills were not carried. His term expired in March, 1837, and he resumed the practice of his profession. In 1841 he was appointed secretary of the treasury by President Harrison, and retained that office under President Tyler. His first official report proposed the imposition of 20 per cent. ad eunten duties on certain articles for the relief of the national debt, disapproved the independent treasury act passed the preceding year, and urged the establishment of a national bank. He was requested to prepare a bill for the last purpose, which was passed with some alteration, but was vetoed by the president. Mr. Tyler thereupon indicated a plan for a bank of moderate capital for the regulation of exchanges, and at his request Mr. Ewing helped to frame a charter, which was immediately passed and in turn vetoed. Mr. Ewing, with all the other members of the cabinet except Mr. Webster, consequently resigned (September, 1841). On the accession of Gen. Taylor to the presidency in 1849, he took office as secretary of the newly created department of the interior, which he organized. Among the measures recommended in his first report, Dec. 8, 1849, were the extension of the public land laws to California, New Mexico, and Oregon, the establishment of a mint near the California gold mines, and the construction of a road to the Pacific. On the death of Taylor and the accession of Fillmore, in 1850, Mr. Corwin became secretary of the treasury, and Mr. Ewing was appointed by the governor of Ohio to serve during Corwin's unexpired term in the senate. In this body he refused to vote for the fugitive slave law, opposed Clay's compromise bill, reported from the committee on finance a bill for the establishment of a branch mint in California, and advocated a reduction of postage, river and harbor appropriations, and the abolition of slavery in the District of Columbia. In 1851 he retired from public life. Among the most elaborate of his written professional arguments are those in the cases of Oliver v. Piatt et al., involving the title to a large part of Toledo, Ohio; the Methodist church division; the McIntire poor school v. Zanesville; and the McMicken will, involving large bequests for education. In February, 1861, he was a delegate from Ohio to the peace conference in Washington. — Thomas, his son, born at Lancaster, Ohio, Aug. 7, 1829, was chief justice of Kansas, 1861, served in the civil war, and received the brevet of major general of volunteers in 1864.

EXARCH (Gr. ἐξαρχος, leader), in the eastern Roman empire, an ecclesiastical or civil dignitary invested with extraordinary authority. At first exarchs were officers delegated by the patriarch or synod to visit a diocese for the purpose of restoring discipline. The exarch was also the superior of several monasteries, in distinction from the archimandrite, who was the superior of one, and was of a rank inferior to that of patriarch and superior to that of metropolitan. In the modern Greek church the exarch is a legate a latere of the patriarch. He visits the provinces to investigate ecclesiastical cases, the differences between prelates and people, the monastic discipline, the administration of the sacraments, and the observance of the canons; and he usually succeeds to the patriarchate. — As a civil officer, the exarch was a viceregal intrusted with the administration of one or more provinces. This title was given to the prefects who from the middle of the 6th century to the middle of the 8th governed that part of Italy which was subject to the Byzantine empire. They were instituted after the reconquest of Italy from the Ostrogoths by Narses, to oppose the progress of the Lombards, then threatening to occupy that country. They held their court at Ravenna, and combined civil, military, judicial, and often ecclesiastical authority. They appointed dukes as vice governors for several parts of Italy. The exarchate was destroyed by the Lombards in 752. When Pepin of France conquered Ravenna, it was ceded to the pope. The title of exarch for high civil and military officers remained in the West till the 12th century.

EXCELLENCY, a title borne originally by the Lombard kings, and then by the emperors of the West from Charlemagne to Henry VII. It was adopted in the 15th century by the Italian princes, who exchanged it for that of highness (altezza) after the French and other ambassadors had been permitted to assume it. In France it became about the middle of the 17th century a common title for the highest civil and military officers; and in Germany it was given also to doctors and professors in universities. It is the title of every nobleman in Italy; in France, a duke is addressed as excellence, and a prince as altezza. It is the usual address of foreign ministers and of the governors of British colonies. The president of the United States is sometimes called his excellency the president, but there is no legal sanction for this; the founders of the government having decided after discussion to bestow no title upon the president. A committee of the senate reported in favor of the style "his highness," but the house opposed any title besides those expressed in the constitution. Massachusetts is the only state whose constitution grants the title of excellency to its governor.

EXEMPTIONS. See Exemption.

EXCHANGE, a gathering place for the transaction of business. In Venice, Genoa, and other
Italian cities, regular commercial gathering places existed at an early day. The modern institution of exchanges, however, dates more particularly from the 16th century. In continental Europe the name Börse in German, bourse in French, and биржа in Russian, originated from the belief that the first gathering of the kind took place in the early part of the 16th century at Bruges, in Flanders, in the case of a family of the name of Van der Borse. According to another tradition, the first exchange was held at Amsterdam in a house which had three paws hewn in stone over the gates, thus accounting for the use of the word bourse. Previous to the latter part of the 16th century the London merchants used to meet without shelter in Lombard street. Sir Richard Gresham, having seen the covered walks used for exchanges abroad, contemplated erecting a similar building in London. The scheme was carried into effect by his son Sir Thomas Gresham, who offered to erect a building if the citizens would provide a plot of ground. The site north of Cornhill, in the city of London, was accordingly purchased in 1566 for about £8,600. On Jan. 31, 1570, Queen Elizabeth caused it to be proclaimed the "Royal Exchange." This structure was destroyed by the great fire of 1666. The new exchange was commenced at the end of 1667, and publicly opened for business Sept. 28, 1669. This building, which was 210 ft. by 135, cost nearly £600,000, and was destroyed by fire Jan. 10, 1838. The corner stone of the present royal exchange was laid in 1842, and the building was opened Oct. 28, 1844, by Queen Victoria. It is an imposing edifice, embellished with many statues, and cost £1,800,000. The area appropriated to the meetings of the merchants is 170 ft. by 112, of which 111 ft. by 53 is uncovered. Here the English, German, Greek, Mediterranean, and other foreign merchants, all have their appropriate places and corners, and meet daily for the transaction of business. The busiest hour is from 3 to 4 P.M. The two great days on change are Tuesday and Friday, when an extra meeting for transactions in foreign bills of exchange takes place previous to the regular meeting, which is attended by the principal bankers and merchants of London, and which derives great importance from the immense business transacted within about half an hour. The whole foreign commerce which centres in London is here concentrated in a handful of bills of exchange. There is much less excitement than at the general exchange. A few brokers pass between the bankers and merchants, and the bills are bought and sold almost in a whisper.—The most celebrated continental exchange is the bourse of Paris, which was inaugurated in 1824. The building has the shape of an ancient peripteral temple, and is calculated to hold more than 2,000 persons. The Paris exchange is a combination of a stock and bill exchange, and commenced chiefly to these branches of business. The St. Petersburg exchange, built between 1804 and 1810, approaches the Paris bourse in splendor. The Hamburg exchange resembles it both in shape and grandeur. The exchange of Amsterdam was finished in 1613, and is an edifice of great magnitude. The bourse of Antwerp, one of the oldest and most remarkable of Europe, which was chosen by Sir Thomas Gresham as a model for the first royal exchange in London, was totally destroyed by fire, Aug. 2, 1858, and has since been rebuilt in the rue de la Bourse. A large portion of the commerce of the world was transacted in it for a considerable time. At Amsterdam, Hamburg, Vienna, Constantinople, St. Petersburg, Berlin, Frankfort, &c., the exchanges are numerously attended, but the exchange of London stands unrivalled in Europe for the magnitude of its transactions.—The merchants' exchange in New York was founded in 1817. Its first building, in Wall street, between William and Pearl streets, was built of Westchester marble, three stories in height, with the city post office in the basement, and insurance and other offices on the third floor. It was opened in 1827, and was destroyed by the great fire of Dec. 16, 1835. The second exchange, on the same site, was built of Quincy granite, at a cost, including the value of the ground, of $1,800,000. It was subsequently sold to the general government to be used as a custom house. The present exchange has an imposing marble front in Broad street, near Wall street, with entrances also in Wall and New streets. Buildings for similar purposes, and generally of large size and great cost, exist in all the principal cities of the United States.
an easy transmission of wealth and its safe keeping in foreign countries almost a necessity. Of course the bills drawn by them were upon persons of their own race. The negotiation of the bills of exchange by law can be traced back about 44 centuries, the earliest being an ordinance of the city of Barcelona in 1894 respecting the acceptance of bills of exchange. An edict of Louis XI. in 1468 is the first notice of the subject in the laws of France. (See Kent’s "Commentaries," vol. iii., p. 72, note.)

—in form, a bill of exchange is an order or request addressed by one person to another directing the payment of money to a third person. The first is called the drawer; the second is the drawee until the bill has been presented and accepted, and then he is called the acceptor; the third is the payee. But sometimes the bill passes through several hands, which may be either by successive indorsements specifying to whom payment is to be made, or by what is called an indorsement in blank, by which it is meant that the payee, or the subsequent holder to whom the bill has been indorsed, merely writes his own name on the bill, which is equivalent to making it payable to bearer. The most important incident of a bill of exchange is its negotiability, that is to say, facility of transfer from one person to another. For this purpose it is essential that the engagement of the several parties, whether drawer, acceptor, or indorser, should be disentangled from all matters not appearing upon the face of the bill. This, therefore, is the general rule, subject to some exceptions which will be presently mentioned. Equally necessary is it that the bill itself should by its terms involve no uncertain contingency, as to depend upon an event that may not happen, or upon some condition which may be the subject of controversy. Hence it has been uniformly held that it must be payable at a fixed time, that is to say, at some period which is certain; but it may be so far contingent as to depend upon an event which must inevitably happen, though the precise time cannot be specified. Thus a bill may be payable a certain time after the death of a particular person; but it would not be a good bill if made payable after the arrival of a certain vessel. The one event is certain to happen at some period, though it may be remote; the other may not happen at all. Again, a bill of exchange must be expressed to be for the payment of money only, and would not be good if payable in cattle or other species of property, nor even if made payable in bank bills, though it is held in some cases that if payable in currency it is a good bill, as this implies specie or its equivalent. When it is said that a bill is not good if subject to any contingency or payable other than in money, it is intended merely that it is not negotiable with the legal effect which pertains to a bill drawn in the prescribed form. It may nevertheless constitute a valid contract between the original parties, and may even be transferred so as to vest in the assignee the same right which the payee would have had against the drawer or acceptor. The transfer in such case will, however, be subject to the same rules that apply to other personal contracts usually denominated choses in action. In other words, the transfer is itself a contract; and although it is not necessary that it should be in writing, yet it derives no aid from mercantile usage respecting the indorsement of bills. The delivery of a note not negotiable may give an ownership if so designed, and this is so in respect to a bond or other contract. But by the common law there was this limitation, that the right of the holder could be enforced only in the name of the original obligee, it being a rule that a chose in action was not assignable. In equity, however, the right of the assignee was recognized, and so to a certain extent it came to be in the common law courts, the formality of using the name of the assignor in a suit brought upon such chose in action being all that is retained of the old strictness. In most of the states even this has been abrogated, and the real party in interest, by which is meant whoever has the actual ownership, may be the party to the action. Again, such transfer confers no greater right than the original payee or obligee had, and is subject to any defense, legal or equitable, which the other parties had against such payee or obligee prior to actual notice of the assignment, or what in law would be tantamount thereto. The bill, or rather contract, as it should be termed in the case supposed, is itself also subject to one important rule distinguishing it from a proper bill of exchange, viz., that it does not import a consideration unless expressed. If, therefore, no consideration is specified, parol evidence thereof will be necessary, as the rule of the common law is that a consideration is an essential requisite of a contract; but parol evidence will be inadmissible in all those cases in which by statute it is required that the contract should be in writing, as when the contract is not to be performed within one year, or when it is to answer for the debt of another person, &c. It will now be understood what is the negotiability above referred to as being the peculiar incident of a bill of exchange. The bill, in the first place, imports per se to have been given for value, even if it does not contain the usual clause "for value received," which, though generally inserted, is mere surplusage; and every successive holder who has received it before it was due, in the regular course of business, for a valuable consideration, is entitled to enforce it according to the terms of the obligation expressed therein, without regard to any transactions between the original parties. To this rule there are some exceptions. For example, when the bill was given for a gaming debt or when usury is involved, in which cases the bill is declared to be absolutely void by statutes in England, which have been generally refunded in the United States. When there
has been fraud in the transaction to which the bill relates, which would have been a defence as between the original parties, the rule is that a bona fide holder for value is not affected thereby; with however this limitation, that the bill has been received not only without knowledge of the fraud, but without such notice of the circumstances as should have induced suspicion and inquiry. If the bill at the time of transfer has become due, this is in law deemed sufficient to call for inquiry, and the indorsor in such case takes the bill subject to whatever defence there would have been against the party from whom he received it. When a bill has been stolen or lost, and has been put into circulation again, a bona fide purchaser is entitled to enforce it against all previous parties, provided there were no circumstances that should have led him in the exercise of ordinary prudence to inquire into the title of the party from whom he received it. It will in such a case be a question of fact whether due diligence has been used by the holder, and the burden of proof is imposed upon him, upon its being shown that the bill had been stolen or lost. The question in such case would be between the person who had lost the bill or from whom it had been stolen, and the person who had received it after the theft or loss. The liability of the original parties is not affected.

-Bills of exchange are of two sorts, foreign and inland; the former being drawn by a merchant in this country upon another residing abroad, or by a foreign merchant upon one residing here; the latter when both drawer and drawer reside in the same country. The principal rules relating to bills of exchange grow out of mercantile usage respecting foreign bills; but by statute in England and the United States both are now put upon the same footing, with the exception only that damages are allowed upon foreign bills which come back protected for non-acceptance or non-payment. By statute in England and the United States, promissory notes are made negotiable in like manner as inland bills of exchange. The same principles therefore, in respect to negotiability and the legal incidents thereof, apply to both.

EXCISE, a term employed to designate a particular form of taxation. Excise taxes or duties are distinguished from customs in being such as are imposed upon domestic commodities, chiefly manufactures, such as glass, paper, spirits, &c., while customs are duties levied upon merchandise imported or exported. Both kinds are included under the common term imposte. Excise duties were first imposed in Great Britain by the long parliament in 1648, but a number of articles of foreign production were included in the act, as tobacco, wine, sugar. At the same time it was enacted that a bona fide duty in the hands of the retailer in addition to what had been paid on importation. Since that time they have been regularly continued, but with modifications from time to time as to the articles subject to the duty and the rate of charge. The articles of foreign growth and manufacture are now transferred to the department of customs. At the present time excise duties are nearly all collected on fermented and distilled liquors and chicory, though license duties are also classed with the excise taxes. For the year ending March 31, 1872, the excise duties collected in the United Kingdom amounted to £23,886,064, of which £8,670,955 were collected on malt, £12,274,596 on spirits, and £3,781,979 for licenses.—Excise duties have not been generally levied in the United States, but the national government has relied upon customs as its principal source of revenue. An excise duty on the manufacture of spirits during Washington's administration led to what was called the whiskey insurrection in Pennsylvania, which was soon suppressed, but the tax was not continued. Others were imposed in 1813, but repealed in 1817. After the breaking out of the civil war in 1861 it became necessary to resort to every available source of income, and an elaborate system of excise duties was established, designed in some form to reach nearly every species of manufacture. The most of these duties have successively been abolished, but those on spirits and tobacco are retained. For the purposes of comparison with the excise duties collected in Great Britain in 1872, the following figures are given. The duties collected on the manufacture and sale of distilled spirits for the year ending June 30, 1872, were $49,475,518 86; on fermented liquors, $8,099,969 72; on tobacco, $18,674,589 96.—The relative advantage of excise duties and customs has been much debated. The latter are evaded to a large extent by smugglers, but the excise duties are also evaded, particularly in respect to spirits. This was strikingly illustrated in the United States, where it was found that a tax of $2 a gallon on the manufacture of 320,000 barrels produced less revenue than one of 50 cents. Excise duties are also objected to on the same ground with an income tax, namely, that they expose the manufacturer's private operations. Another objection that has tended to make them more obnoxious than any other is the arbitrary manner of enforcing them, which is felt to be an interference with private liberty and independence, which the common law has sedulously protected. It is supposed that in this matter of collecting its revenue the government considers itself entitled to dispense with all the ordinary protections to individual right and liberty, and to provide the most unjust and arbitrary proceedings at discretion. This was illustrated in a very remarkable manner in the recent case of Henderson, in which it was held by the majority of the United States supreme court that a bona fide duty in the hands of the retailer in addition to what had been paid on importation. Since that time they have been regularly continued, but with modifications from time to time as to the
one time had a design to evade payment of the duties upon them; a purpose of which the purchaser was wholly ignorant. (14 Wallace’s Reports, 44, 64.)

EXCOMMUNICATION (Lat. ex, out of, and comm:unicatio, intercourse), the cutting off a member of a religious society from intercourse with the other members in things spiritual. This penalty was familiar to the pegan nations of antiquity, as well as to the Jews; and from them it passed into use among Christians. In Greece, persons guilty of enormous crimes were given over to the Furies with certain terrible forms of imprecation. There were three kinds of excommunication among the Greeks. By the first, the criminal was excluded from all intercourse with his own family; by the second, he was forbidden to approach any temple, or to assist at any sacrifice or public rite; by the third, it was forbidden to give him shelter, food, or drink. The Romans borrowed the rite from the Greeks, and the formulas sacris interdicere, to forbid the use of sacred things, diris devovere, to devote one to the Furies, exeamari, to curse, &c., have much the above meaning. According to Caesar, the highest punishment inflicted by the druids, among Celtic nations, was to exclude an offender from all their religious rites. Such a man was considered by all as wicked and an enemy of the gods; he was shunned even by his own kindred, denied all justice and hospitality, and lived and died in infamy. The Semitic races, in ancient and modern times, have practised excommunication, and it is now in use wherever Mohammedanism extends. We have the testimony of Josephus that excommunication was practised among the Jews, and he notes the extreme rigor with which the Essenes applied it. Among them, the criminal who was thus put out of the society of his brethren not only could hold no communication with them even for the necessaries of life, but was bound by vow not to ask food or shelter from strangers. Thus driven to subsist on herbs and hides in caves, they eked out a miserable life, which often ended in a tragic death. There were three kinds of excommunication among the Jews. The mildest form consisted in a temporary exclusion from religious and social intercourse for 30 days. If during this interval the culprit did not repent, another term of 30 days was added, which was lengthened to 90 days if he still remained obdurate. If he persisted at the end of that time, he was visited with the more severe and solemn form of excommunication, that is, publicly cast out of the synagogue, with awful excoriations taken from the law of Moses. When this penalty and all other human means had been tried in vain, he was given over to the divine judgment as an irreclaimable sinner.—In the early Christian church we find excommunication practised by St. Paul, and enjoined both by him and by St. John. In the post-apostolic ages it was the universal custom both in the East and West, modified only from the Jewish practice in accordance with the requirements of Christian belief and worship. The lowest degree consisted in the refusal of eucharistic communion; the next in exclusion from the church and the liturgical service; the third in total exclusion, by solemn denunciation, from membership with the church, and from all intercourse, social or religious, with Christians. This highest degree of excommunication was accompanied in some instances by an awful form which explains the anathema maranatha of St. Paul. When the person excommunicated was not only guilty of apostasy or heresy, but one who sought to draw the multitude after him, a prayer was made by some churches that God should come down in judgment and cut the seducer off, as in the cases of Julian the Apostate and Arius.—In the Latin church, since the publication of Gratian’s Decretum, and the regular adoption of canon law, two kinds of excommunications have been described by canonists, the minor and the major. The former excluded the offender from the use of the sacrament and the benefit of certain ecclesiastical privileges and immunities. It was incurred for sins that were not public, or for communicating with persons under the solemn ban. The major excommunication cut the offender off not only from church membership, but from social intercourse with Christians. He was solemnly and by name called sitandus, “to be shunned by all.” As heresy, public apostasy, and great crimes by which excommunication was incurred, came early to be recognized as state offences and misdemeanors punishable by the laws of the empire, so it was soon decreed by statute that the excommunicated should incur privation of office and rank, loss of civil rights, and forfeiture of property. These dispositions became more or less a part of the common law of western as well as of eastern Christendom. When the Roman empire was restored in Charlemagne, and the German emperors were wont to receive the imperial crown from the pope, public excommunication pronounced against them was held to involve a forfeiture of their crown. This was also held to be the case with sovereigns whose kingdoms were fiefs of the see of Rome. It was against such high offenders that the major excommunication was fulminated, with the awful ceremonies mentioned in history. In the present discipline of the Roman Catholic church the excommunication of sovereigns is reserved to the pope, and has been very rarely practised since the 10th century. In 1570 Pope Pius V. excommunicated Queen Elizabeth of England, and formally absolved her subjects from their allegiance. In the modern Greek church excommunication cuts off the offender not only from the “communion of saints,” but from all intercourse, religious or social, and consigns him, living and dead, to the evil one. The power of excommunication was maintained by the reformers, who claimed it as a prerogative
EXCRETION

of the Christian community, while the Roman Catholic and eastern churches vested it in the episcopal order. In the church of England the vigorous provisions of the old canon law were for the most part kept in force after the reformation, and were a part of the law of the land until the reign of George III., when (52 George III., c. 127) excommunications and the consequent civil effects were done away with, except for certain specified cases. When the person excommunicated for the offences mentioned in the act allows six months to pass without submitting to correction, the bishop certifies this contumacy to the court of chancery, which issues its writ to the sheriff. The severest penalty enforced is six months' imprisonment. In Scotland, when the lesser excommunication has failed, the delinquent is subjected to the greater, and the faithful are warned to avoid all unnecessary intercourse with him. In the Protestant Episcopal church certain offences entail the privation of holy communion, while "great holiness of offence" is followed by loss "of all privileges of church membership." The Methodist Episcopal church vests the power of excommunication in the minister, after a trial before a jury of peers of the accused. Excommunications is inflicted among the Presbyterians, Congregationalists, and Baptists by the church, according to the view of the early reformers.

EXCRETION (Lat. excomminare, excrementum, to purge), the elimination of waste or effete matters from the living body. There is evidence that during the vital processes every exertion of activity by a living tissue or organ is necessarily accompanied by a molecular change in its chemical constitution. So intimate is this connection between the alteration of substance in a living organ and its physiological action, that it is impossible to say with certainty which of these two is the cause and which the effect. The fact is however that, as we have said above, every manifestation of vital activity involves a change in the immediate constitution of the active organ. The consequence of this is that, in the living body, new substances, the result of its internal disintegration, are constantly making their appearance. These substances, termed excrementitious matters, must not be allowed to remain and accumulate; for in that case the constitution of the organs would become so changed from their original condition that they would be no longer capable of performing their proper functions. These matters must therefore be gotten rid of, or eliminated from the body, as fast as they are produced; and the process by which this is accomplished is called excretion. The mechanism of this process is as follows: The excrementitious matters produced in the solid tissues are absorbed from them by the blood, carried by the circulation to some organ adapted to the purpose, exhaled or exuded in the gaseous, fluid, or semi-liquid form, and thus discharged from the body. The two principal excretory organs are the lungs and the kidneys. The venous blood in passing through the lungs discharges the carbonic acid which it has absorbed from all the vascular parts of the body, and returns to the left side of the heart purified and renovated. The blood which passes through the circulation of the kidneys exhales, together with its watery parts, urea, creatine, creatinine, and the compounds of uric acid; nitrogenous crystallizable matters produced in various parts of the system, and which form the important ingredients of the urine. Thus the blood constantly relieves the solid tissues of the excrementitious matters produced in their substance, and is itself relieved of them by passing through the excretory organs. Should this process from any cause be suspended or retarded, the accumulation of excrementitious matters in the body would soon make itself felt by a derangement of the health, and especially by its injurious effects upon the nervous system. Pain, loss of appetite, confusion of mind, disturbance of the special senses, and in extreme cases convulsions, coma, and death, result from the arrest of excretion, which is therefore no less important to life than nutrition.

EXECUTION, in law, the final process to enforce the judgment of a court, according to the old maxim, execution est fructus et finis legis. In its larger application it includes the process of sequestration formerly used by the court of chancery to carry into effect its decrees, attachments for contempt of court, and process in summary proceedings, as upon mandamus and the like; but in its ordinary acceptation it is a writ issued to enforce a judgment in a suit or action in a court of common law. It is unnecessary to speak of the execution in the various real actions which have become obsolete. In England the actions for recovery of real estate, whether corporeal or incorporeal, are, by statute 3 and 4 William IV., c. 27, now limited to ejectment, quare impedit, and actions for dower. The first is the ordinary mode of trying a title to lands, and the execution upon a judgment of recovery is a writ of possession, which in form is directed to the sheriff, commanding him to deliver to the plaintiff the possession of the lands so recovered. Quare impedit is an action by which the right to a benefice is determined, and takes its name from a clause in the old Latin form of the writ by which the defendant was commanded to appear in court and show the reason why he hindered the plaintiff from presenting a proper person to a vacant office in a church. Upon judgment in favor of the claim, the execution is a writ directed to the bishop commanding him to admit the person nominated by the prevailing party. The action also lies for an office in eleemosynary institutions, as hospitals and colleges, which are endowed for the support of their inmates; and the execution in such cases is the same, except that it will be directed to the corporate officers or
persons who have the control of the institution. In respect to lay officers, as they are called in distinction from ecclesiastical and eleemosynary, the mode of proceeding is by quo warranto or mandamus. The former was strictly a proceeding in behalf of the crown against any one who had intruded into an office, but is now allowed by statute in England (9 Anne, c. 20) to determine disputes between private parties claiming an office adversely to each other. The proceeding in that case, although in form in behalf of the crown, yet is stated to be on the relation of the person prosecuting, and upon judgment in his favor execution issues to remove the intruder. Mandamus is a remedy where there is a refusal to admit the claimant to an office, or where he has been wrongfully removed. If the claim be established, a peremptory mandamus issues, directed to the defendant, commanding him to admit or restore the claimant, who is in this case, as well as in the proceeding by quo warranto, called the relator. This is, however, not strictly an execution, as if not obeyed it must be enforced by another process called an attachment. In other actions, where the subject is an injury to real estate, usually the remedy is a recovery of damages; but in some instances specific relief is given, as in an action for a nuisance there may be a judgment that it be abated, and the execution in such case follows the judgment. So in some personal actions, formerly, there might be a judgment for the delivery of the specific thing, as in detinue, which was brought to recover possession of chattels, and the judgment was enforced by an execution called a distriungas, which commanded the sheriff to make distress of any goods of the defendant until he complied with the judgment; but if he still refused, there could only be an assessment of the value of the thing recovered, and a sale of defendant's property to pay the same. In the action for seisin, which was originally limited to the recovery of property which had been wrongfully distrained for rent, the writ by which the action was commenced directed the sheriff to replevy, that is, take the property in question, and deliver it to the plaintiff upon pledges to prosecute. If the defendant succeed in the action, the judgment is that he have return of the property, or if he elects, he may have an assessment of the value, and recover that amount as damages. In the former case the execution is for redelivery of the property, in the latter merely for the damages.

Before proceeding to the consideration of other actions, it will be proper to state the modifications which have been made in the United States in respect to those already noticed. All the common-law real actions are generally abolished except seisin, which, in a simplified form, is used for the trial of title to land in all cases. Quo animad Bett is not retained, nor is there any action for the recovery of an office except the proceedings by quo warranto or mandamus. The action of detinue has been generally abolished, and the action of replevin has been extended to all cases of the wrongful taking or wrongful detention of personal property. In the latter action the plaintiff, instead of an actual reprieve of the goods, may arrest the defendant and compel him to give bail, and the final judgment in such case will be for damages; and so the defendant, if he succeeds in a case where the goods have been reprieved, may take judgment for the value, the execution being in either of these cases merely for damages.—We now come to the ordinary actions in which there is judgment for a money demand. At common law there are three forms of execution upon such a judgment: 1, a fieri facias, so called from the terms of the writ by which the sheriff is commanded that of the goods and chattels of defendant he cause to be made the amount of the debt or damages recovered; 2, elegend, which is a writ given by an ancient statute (18 Edward I., c. 18), whereby, if the plaintiff elected, possession of the goods and chattels of defendant was delivered to plaintiff under an appraisement of the value thereof, which to that extent was to be a satisfaction of the judgment; but if not sufficient, then possession of one half of the freehold lands of defendant was also to be delivered until from the rents and profits thereof the judgment should be paid; 3, a copias ad satisfactionum, which is a writ directed to the sheriff commanding him to take the body of the defendant, and keep the same until satisfaction of the debt. The course of proceeding upon this writ was to imprison the defendant in the debtors' jail, of which the sheriff had in law the charge. (See Debtor and Creditor.) Having traced the origin of the terms applied to executions, we shall limit ourselves to a brief explanation of the legal incidents as now prescribed by statute in the United States. The two actions are seisin, which was originally limited to the recovery of property and the copias ad satisfactionum, which have been already explained, and which are designated by the abbreviated terms fi. fa. and ca. sa. The fi. fa. is a writ directed to the sheriff by which he is commanded to make the amount of the judgment by sale of the defendant's goods and chattels, or if these should not be sufficient, then of the lands of which he was seized on the day when the judgment was docketed. An exemption is made of certain property from levy under execution, viz.: household furniture, necessary provisions and fuel for the use of the family for a specified time, stock in trade, necessary wearing apparel, bedding, &c., tools and implements to an amount named, a family Bible, family pictures, school books, the family library, &c., and in addition, a lot and building occupied as a residence by the debtor, being a householder and having a family, to a value named, which in most states is $1,500 or upward. (See Fieri Facias.) The ca. sa. is the old form of
execution against the person of the defendant, and since the abolition of imprisonment for debt can be issued in a few cases only. (See Bail.)

Executors, the person appointed to carry into effect the directions contained in a last will and testament. By the common law of England, or rather by the law as administered in the ecclesiastical courts, an infant of the age of 17 was qualified to act as executor. Prior to that age, letters of administration were granted to some other person durante minore statu; but by statute 88 George III., c. 87, such administration must now continue until the person named as executor has reached the age of 21. A married woman cannot act as an executrix without the consent of her husband, inasmuch as he is responsible for her acts. When executors are not named in a will, or are incompetent, or refuse to act, letters of administration with the will annexed may be issued, under which the same powers may be exercised that could have been by competent executors duly appointed.

An executor de son tort, as he was formerly called, i. e., one who intermeddled with the estate without having lawful authority, was liable to the extent of any assets which he might have appropriated to be sued as an executor of his own wrong, but was not entitled to institute a suit as executor. The doctrine of executor de son tort can scarcely be said to be recognized in America, but summary remedies are given against intermeddlers. (See WILL.)

Exelmans, or Exelmans, Henry Joseph Idére, count, a French general, born in Bar-le-Duc, Nov. 18, 1775, killed by a fall from his horse in July, 1862. He served first in Italy, became an aide-de-camp of Murat, went with him to Germany, and was made colonel after the battle of Austerlitz, and brigadier general in 1807, after that of Eylau. He accompanied Murat in 1808 to Spain, where he was made prisoner and carried to England. He made his escape in 1811 and rejoined Murat, then king of Naples. When disagreement arose between Murat and Napoleon, Exelmans returned to France, and served in the Russian campaign with the rank of general of division. He retained his position in the military service after the first restoration, but resumed his duties in the army of Napoleon upon his return from Elba, and was raised to the peerage. He did not take part in the battle of Waterloo, being under the command of Grouchy. Under the second restoration he was in exile till 1819. He was restored by Louis Philippe to the chamber of peers, and denounced in that body the execution of Ney as an “abominable assassination.” Under the presidency of Louis Napoleon he was made chancellor of the order of merit, chief of France, and senator.

Exeter, a town and one of the county seats of Rockingham co., New Hampshire, situated on Exeter river, a branch of the Piscataqua, and on the Boston and Maine railroad, 12 m. S. W. of Portsmouth; pop. in 1870, 8,487. The falls at this point, which furnish good water power, are the head of tide water and the limit of navigation for small vessels. The principal village, built around the falls on both banks of the river, occupies a plain, and is laid out with wide streets shaded with elms. Besides the state courts for the county, sessions of the United States circuit and district courts are held here. The Exeter manufacturing company, incorporated in 1829, has more than 10,000 spindles in operation, and produces about 2,000,000 yards of sheetings annually. It has just erected another mill of equal capacity. The wool business is one of the principal branches of industry and trade in the place, being carried on by several large establishments. There are also several manufactories of carriage, 1 of drain pipe, 3 of harnesses, 3 grist mills, 1 iron foundry, 1 planing mill, 1 saw mill, 1 machine shop, a national bank, and 2 saving institutions. The town is chiefly noted as the seat of Phillips' academy, founded in 1781 by John Phillips, LL. D., who bequeathed to it a large portion of his estate. It is one of the most celebrated schools for preparing boys for college in the country, and in 1872 had 4 instructors and 162 students. The original building, in which some of the most famous men of the country were educated, was burned in 1870; a new one was completed in 1872. The Robinson female seminary, organized in 1859 with an endowment of $300,000, has a collegiate department, and in 1872 had 9 instructors and 263 students. Exeter contains several public schools, a town library of 3,428 volumes, a weekly newspaper, and 7 churches. It was settled in 1638, and suffered severely during the Indian wars from 1690 to about 1710. During the revolutionary period it was the capital of the state and the headquarters of its military operations.

Exeter, a city, port, and parliamentary borough of England, capital of Devonshire, and a county in itself, on the Exe, 10 m. from its mouth in the English channel, and 159 m. W. S. of London; pop. in 1871, 34,646. It is 194 m. from London by the Great Western railway, and is the point at which railways centre from South Devon, North Devon, Salisbury, and Exmouth. The Exe is here crossed by a handsome stone bridge leading to the suburb of St. Thomas. The city, standing on a steep acclivity, has two wide principal streets, which cross each other at right angles near its centre. It is generally well built, has many fine squares and terraces and ancient houses, and in its suburbs and environs are numerous elegant villas. It was formerly strongly fortified, but its exterior wall is now in a ruinous state, and a part of the rampart has been converted into a promenade. On an elevated grassy acropolis is Rougemont castle, anciently the residence of the West Saxon kings, repaired by William the Conqueror. Exeter is the seat of a bishopric founded about 1000. Its cathedral, a magnificent building of cruciform shape, was begun
about the year 1100. Its entire length is 408 ft.; it has two Norman towers 130 ft. in height, ten chapels or oratories, and a chapter house. One of the towers contains an immense bell weighing 12,500 lbs., and the other has a chime of 11 bells. Among the numerous schools is a free grammar school founded by the citizens in the reign of Charles I., in which the sons of freemen are instructed gratuitously, and which has 18 exhibitions to either of the universities. Exeter has a theatre and various literary and charitable institutions. Its commerce is much less now than formerly, but it has some internal trade, and is an important corn and provision market. The river Exe is navigable for vessels of large burden to Topsham, 4 m. below Exeter; and by means of a canal built in 1568, subsequently much enlarged, and one of the oldest in England, vessels of 400 tons burden can come up to the quay near the walls of the town. Serge and other woollen goods were formerly manufactured in this city and the neighboring towns to a large extent, and shipped to the continent and the East Indies; but the introduction of machinery and the lower price of fuel in the north of England have very much diminished this trade.—This city is of unknown antiquity, and is supposed to be the Caer-Isca of the Britons, and the Isca Damnoniorum of the Romans. It was the capital of the West Saxons, and in the reign of Alfred in 876 it was surprised by the Danes. It was besieged and taken by William the Conqueror. In the civil war it es-

![Exeter Cathedral](image)

poused the royal cause, was taken by the parliamentarians, was retaken by Prince Maurice, became the headquarters of the royalists in the west and the residence of Charles's queen, and in 1646 surrendered after a blockade to Fairfax.

**EXHAUSTION** (Lat. exhaure, to draw out), a method of the ancient geometry, applied with success by Archimedes and Euclid, by which the value of an incommensurable quantity was sought by obtaining approximations alternately greater and less than the truth, until two approximations differed so little from each other that either might be taken as the exact statement. Thus the length of a circumference was sought by calculating the length of inscribed and circumscribed polygons, and increasing the number of sides until the lengths of the outer and inner polygon were sensibly the same, when that of the circumference could not differ sensibly from either. By this method the space between the polygons and the curve was exhausted, as it were, and hence the term. Exhaustion is now interesting chiefly because it was one of the methods which led, in the 17th century, to the invention of the differential calculus.

**EXMOUTH**, a town of Devonshire, England, 10 m. S. E. of Exeter; pop. about 6,000. It is a celebrated sea-bathing place, and is beautifully situated on the E. side of the entrance to the estuary of the Exe, in an opening of the cliffs which surround the shore. The modern part of the town consists of detached villas and terraces surmounted by neat houses, and there are many pleasant promenades. A gradually sloping sandy beach below the town is the principal resort of bathers. There is a handsome parish church with a tower more than 100 ft. high. Fisheries constitute the principal occupation; and many of the women are engaged in lace-making.

**EXMOUTH**, Edward Pelham, viscount, an English admiral, born at Dover, April 19, 1757,
died at Teignmouth, Jan. 23, 1833. He entered the navy at the age of 13, and first distinguished himself in the battle of Lake Champlain, Oct. 11, 1776. In 1782 he became a post captain, and from 1786 to 1789 he was stationed on Newfoundland. In 1793, commanding the frigate Nymph, of 36 guns, he captured the French frigate La Cleopâtre, of equal metal, after a desperate battle. This was the first prize taken in the war, and Pellew was knighted. He was then employed in blockading the French coast. At Plymouth in 1796, by great bravery and presence of mind, he saved the lives of all on board a wrecked transport, leaving the ship himself just before it went to pieces. For this he was made a baronet, and received other honors. Meanwhile, in command of the Arethusa, 44 guns, he had fought a number of engagements with French vessels, being always victorious. He also commanded successively the Indefatigable, 49 guns, and the Impénètrable, 78 guns. In 1802 he was elected to parliament, but in 1804 was again called to the naval service, promoted to rear admiral, and made commander-in-chief in the East Indies. In 1808 he was made vice admiral, and in 1810 was sent to command in the Mediterranean. In 1814 he was created Baron Exmouth of Canonteign, with a pension of £2,000, and in the same year was made a full admiral. During his command in the Mediterranean he concluded treaties with Algiers, Tunis, and Tripoli, for the abolition of Christian slavery. The day of Algiers having violated his treaty, Exmouth sailed into the harbor of Algiers, Aug. 26, 1816, with 19 vessels, accompanied by a Dutch fleet of 6, and engaged the Algerine fleet and batteries at close quarters. After an action of seven hours, every Algerine ship and the arsenal and several other buildings were on fire. The day conceded everything that was demanded, and signed a new treaty. In this affair Lord Exmouth received two slight wounds and had his clothes torn to shreds by the shot. About 1,300 Christian slaves were liberated, and on his return the admiral was made a viscount. He retired from public service in 1821.

**EXODUS (Gr. ἔξοδος, departure), a book of the Bible, the second of the Pentateuch. It derives its name from the principal event recorded in it, the departure of the Hebrews from Egypt, and contains the history of that people from the death of Joseph until the building of the tabernacle. The researches of modern Egyptologists have thrown much light on the Biblical narrative. The land of Goshen, where the Hebrews had been permitted to settle, was east of the delta of the Nile, on the borders of Syria, and the places mentioned in connection with the exodus have been identified as follows: Rameses as the town Nashuta, in the E. part of the wady Tumilat; Succoth, the Thanausium of the Romans, N. E. of Lake Timsah; Etham, the fortified wall on the Syrian frontier; Pi-hahiroth, the modern Kalat Agnud, N. W. of Suez; Migdol, the place formerly called Kambyus, where the Persian monument stands; and Basalzephon as the Atakah mountains. The hieroglyphic inscriptions render it probable that the oppressors of the Hebrews were Seti I. and his son Ramesses II., and that Merneptah was the Pharaoh of the exodus. (See Egypt, vol. vi., pp. 461-2.) They show also that the Hebrews had been employed to build temples, fortresses, and granaries; and several monuments depict them at work making bricks, with overseers standing by and sometimes beating them with rods. This does not necessarily lead to the conclusion that the Pharaohs of the period were reckless tyrants. They were severe military rulers, who foresaw that the Hebrews would make common cause with their kindred in Syria in case of an invasion. They strengthened accordingly the fortified wall on the borders, which the Pharaohs of the 12th dynasty had erected, and built new fortresses in Goshen, partly for protection against invasion and partly for keeping watch over the Hebrews. According to the monuments, the troops stationed here were chiefly Libyans, who were not likely to sympathize with the Hebrews. A treaty made by Ramesses II. with the chief of the Khitas in Syria, found on a stele in the temple district of Karnak, provides for the extradition of fugitives escaping over the border. Merneptah's policy was to prevent the Hebrews from gathering into bodies too large to be controlled, which he effected by compelling them to labor in small detachments on the public works. His refusal to allow them to assemble for the purpose of worshipping their God in the wilderness was prompted by fear of some hostile movement on their part, and nothing but the dread of greater disasters than those which would naturally follow their departure induced him to permit Moses to lead them away. Nor are monumental indications wanting for establishing the historical character of Moses. His interview with Merneptah is supposed to have taken place at Tanis, the temporary residence of the last three Pharaohs. He and his people marched first to Tutus, a city south of Tanis, and thence to Shakk Musa, in the neighborhood of Pithon. The route touched the most important Hebrew towns and enabled their inhabitants to join the emigrants. Moses marched them in an easterly direction through the wady Tumilat, which Hebrew labor had supplied with a canal. The Hebrew population was especially dense in this fertile oasis. The Hebrews rendezvoused at Ramesses, a central point in Goshen. A journey northeastward of about 150 m. would have taken them to the borders of Canaan, but would have brought them into conflict with the warlike Philistines. Moses led them in almost the contrary direction; "For God said, Lest peradventure the people repent when they see war, and they return to Egypt." The general
route of the exodus is now fairly established. The Hebrews marched S. E. for three days, then turned S. W., and finally E., their fourth encampment being at Pi-hahiroth, a few miles S. of the present Suez, near a point where the gulf of Suez suddenly narrows to a quarter of its former width. They were on a narrow triangular plain bounded N. by a range of cliffs and S. E. by the expansion of the sea. The Egyptian king had meanwhile gathered a considerable force, especially of chariots, the cavalry of the time, and was following hard upon the fugitives, who, hemmed in between the cliffs and the water, had no apparent way of escape. At the point here assumed as that of the passage there is still a shallow, stretching from shore to shore, almost fordable at low tide. "The Lord caused the sea to go by a strong east wind all that night, and made the sea dry land, and the waters were divided." That is, the east wind piled up the waters toward the head of the gulf, leaving the shallow dry. The idea which painters have popularized, that the waters stood up as a solid wall on each side, is wholly without warrant in the sacred text; all that is implied is that there was deep water on each side of the passage. The crossing was apparently made during the day. At nightfall the Egyptians came up, and seeing the passage still dry attempted to follow. It is apparently implied in the text, though not directly stated, that the wind now shifted; for an easterly wind would have carried the bodies of the Egyptians to the west side, whereas the Hebrews beheld them thrown on the eastern shore, upon which they were. All the implications of the narrative are that the reflex of the waters was gradual; for we are told that "the Lord took off (or rather clogged up) their chariot wheels, and made them go heavily." that is, probably, the returning waters slowly filtered into the sand, making it difficult for the chariots to move. The Egyptians, seeing the waters rising, endeavored to retreat; but in the darkness, their returning van encountering their advancing rear, they could go neither way, and were swallowed up by the rising tide. That this passage was really miraculous is everywhere asserted or implied by all the sacred writers who speak of it. Their route at first lay parallel with the eastern shore of the gulf of Suez, which they apparently touched at one point, the halting places being specified, and several of them are identified with reasonable certainty. At one of these, Rephidim, they were attacked by a body of Amalekites, who were defeated by the Israelites under the command of Joshua. After three months they reached the region of Sinai, in the heart of the Arabian peninsula, where they remained until 14 months after their departure from Egypt, and then set off upon their long wanderings toward the promised land. During this interval the law was given, and those religious and civil institutions were framed which in the course of a generation transformed the Hebrews into a military people, able to cope with the enemies whom they were about to encounter. The history, as related in the book of Exodus, properly closes with the encampment around Sinai, and is continued in the book of Numbers. (See Sina.) -The best works on the historical narrative are Eber's "Aegypten und die Bücher Moses's" (Leipsic, 1868 et seq.) and Durch Gosen zum Sinai (Leipsic, 1872), and Palmer's "The Desert of the Exodus" (London, 1872). EXOGENS (Gr. εξογέν, outward, and γενομαι, to generate), a class of plants so called because their woody matter is increased by additions to the outside of that which first surrounds the central pith. As there are no specific limits to the age of exogenous trees, their diameter indefinitely increases by this annual process, a distinct external layer being added by each year's growth. The outermost of an exogen consists of a central column of pith or medulla, woody zones, and bark. Processes from the central medulla called medullary rays cross the zones transversely. The bark of an exogen parts readily from the underlying wood at a particular season of the year, when a viscid secretion called cambium is produced between the wood and the inner surface of the bark. It is at this period that the leaves expand and the trunk lengthens. The woody fibres in the leaves are prolonged into the stem or trunk, passing down among the cambium, and adhering partly to the wood and partly to the bark of the previous year. By this means new living matter is continually deposited upon the outer portion of the woody stem and the inner portions of the bark. It is in this part of the stem that the intensest vitality exists, the outer and older layers of wood and the inner and older concentric rings of the wood becoming inert and falling off or decaying without injury to the vegetative parts. The office of the medullary processes is very important as means of communication between the centre of the stem and the outside layers or rings; and they are conduits, so to speak, by which the fluid matter passing down the bark can reach the wood next the medulla or pith. These processes, which resemble thin plates, are of a spongy nature similar to that of the pith from which they originated. They sometimes assume sinuosities and undergo partial obliteration; and sometimes the wood itself assumes an excessive irregularity. As these circumstances are to be found mostly in tropical exogenous trees, vines, and climbers, difficulty is sometimes experienced in perceiving from transverse sections their claims to be considered as exogens. This natural character of an outward growth in the exogens is associated with other peculiarities of development of other organs. Thus, the leaves have veins ramifying from the midrib outwardly to the circumference; or if there are several ribs, the veins are still of the same quality, so as to
form an irregular network. These veins never run parallel to each other without ramifications, and even some which appear to do so will be found to possess secondary veins. The leaves also fall away from the branches, being disarticulated from their places of insertion, leaving a clear scar behind. Certain foliolate organs, called stipules, are also frequently attached to the leaves, which is very unusual in endogams. The flowers are mostly quinary, that is, they have five sepals, five petals, and five stamens, or some multiple of that number. The tall and feathery outline of the palms is never seen in the exogams, as none of them depend on a single terminal bud for their develop growth. From the very germination of the seed the difference is apparent in the form of the embryo and in the diotyledonous characteristics of the young plant.

EXORCISM (Gr. ἔξορκισμος, adjuration), a rite having for its object to cast out evil spirits, or to withdraw irrational things from their influence. As the natural attendants of a belief in demoniacal possession, exorcisms have been practised in every age and country. The pagans of old, like those of to-day, were firm believers in the malignant influence of spirits, genii, or demons. Mysterious diseases and other incomprehensible calamities were attributed to such influences. The "medicine dances" in use among the American Indians are found to spring from the same belief which gave rise to the fumigations of the Greeks, Romans, Arabs, and Persians. Among the Greeks exorcising was a profession. Αἰσχινēs and Epicurus were the sons of women who lived by exorcism, and when young practised the art with their mothers. Besides incantations, the burning of certain herbs and drugs, the use of magic ointments, the wearing of amulets, &c., human sacrifices were exceptionally also resorted to; and they are still in use among the tribes of south Africa. The Semitic nations, who kept alive the belief in the one God, form no exception. Among the Hebrews we read of David playing on a harp to procure the departure of the evil spirit which troubled Saul, and that Tobit, by command of an angel, burned the liver of a fish to expel the evil spirit which followed his betrothed wife; and Solomon, according to Josephus, was a mighty exorcist, and left several formulae to be employed in the rite. Christ, who drove out devils himself, bears testimony to the fact that the Jews did so in his day. This power he also committed to his 70 disciples when he sent them on their first mission, and promised that it should be exercised in the church after him. All early Christian writers bear testimony to the fact that exorcisms were practised universally in the churches. This was done more particularly for catechumens, who were adults converted from paganism, and defiled by the unclean initiations and practices of demon worship. The same power of others, considered really possessed in these ages, and the frequent exorcisms performed on catechumens during their long probation, caused the creation of the order of exorcists, which still exists both in the Greek and Roman Catholic churches. In both also the rituals prescribe exorcisms not only for adult, but even for infant baptism, on the ground that by the fall the entire human race has come under the power of Satan. And as the power of the evil one extends to the whole inferior creation, both churches exorcise water, salt, oil, &c., before blessing them and using them as symbols and instruments of Christ's redeeming grace. As the earth was cursed after the fall, so now the church extends Christ's blessing to it and all it contains. Hence the prayers and exorcisms prescribed in the ritual for allaying storms, checking the ravages of hurtful insects, and putting an end to droughts. From the same principle proceeds the custom of blessing habitations, fields, cattle, food, &c. Extraordinary exorcisms, in the present discipline of the Roman Catholic Church, are such as are used in cases of attested demonical possession. These are only performed with the permission of the bishop, in rare instances, and with unusual solemnity. The only forms of exorcism recognized by that church are those contained in the Roman ritual and missal.—Luther, in his Taufbäcklein, preserved partly the form of renunciation of the devil; he considered it as useful to remind the people of the power of sin. These views were adopted in the Lutheran parts of Germany. In the Swedish church, when the Augsburg Confession was again proclaimed at the council of Upsal in 1559, exorcism was retained as a free ceremony in baptism, and on account of its utility. Calvin and Zwingli rejected it, and it became a sort of test between Calvinists and Lutherans. It had become gradually obsolete among the German Lutherans when an attempt was made in 1822 to revive its use. In the first liturgy of Edward VI. a form of exorcism at baptism was retained, which was omitted in the subsequent revision of the prayer book. Canon 72 of the church of England reserves to the bishop the power of granting a license to exorcise. The only remnant of the old baptismal exorcisms to be found in the rituals of the church of England, and the Protestant Episcopal and Methodist Episcopal churches, is the question: "Dost thou renounce the devil and all his works?"—See Bingham, Origines Ecclesiasticae; Stolla, De Origeni Exorcismi in Baptismo; Ferraria, Promptua Bibliotheca; and Theaurus Exorcismorum et Conjurationum (Cologne, 1608).

EXOMOSE. See ENDOMORPH.

EXOSTOSIS (Gr. ἔκστωσις, out of, and βόσκων, bone), an osseous tumor developed on the surface of a bone, originally or eventually continuous with its substance, circumscripted, without interior cavity, having the same structure and life as the bone on which it is found. There are the varieties of growth: in one the bone, like
all other tissues of the system, takes on a morbid development, an eccentric hypertrophy of its substance, forming a well defined tumor on its surface by the mere excess of interstitial osseous deposit; in the other the new osseous matter is deposited originally on the surface, under or between the laminae of the periosteum, separated from the bone at first by cartilage, but afterward becoming consolidated to it in the usual manner of bony processes. The first variety may affect the greater part of a bone, and deserves rather the name of hyperostosis; and the second, by the process of ossification, may be converted into the first; this distinction is of considerable importance in the prognosis and treatment of the affection. The muscles and soft parts over an exostosis are generally not changed, unless the tumor be of considerable size and in the neighborhood of large nerves and vessels; but the periosteum is almost always thickened, and less adherent to the bone than usual. In the first variety the form is regular, and the bony fibres diverge from the natural direction to enter the tumor, as in other forms of eccentric hypertrophy; in the second variety the form is irregular, often fantastic and rough, and there is an evident base by which it is as it were immovably articulated to the supporting bone, except in very old growths; this base in recent cases is cartilaginous and readily separated, and shows that this kind of exostosis originates from and is nourished by the investing periosteum; it indicates also a method of treatment which has been found successful, by denuding them of their periosteum and causing their necrosis and separation from want of nutrition. If the cartilaginous base rests upon the bone, under the periosteum, the removal of this membrane will cause an exfoliation of the subjacent bone; but if between the laminae of this envelope, a similar operation will effect the fall of the tumor without injury to the surface of the bone; the cartilage soon becomes ossified, and the exostosis forms one body with the bone, resembling the first variety in having no basal line of separation. In course of time the excessive deposit of phosphate of lime in these growths may convert them into a substance having the appearance, consistence, weight, and polish of ivory.—Among the constitutional causes of exostosis are syphilitic poisoning, the scrofulous diathesis, and the gouty and rheumatic conditions; the immediate cause is inflammation, produced by mechanical or other means, leading to a deposit first of plastic and then of osseous matter, the development being similar to that of normal bone. In some constitutions there is such a disposition to the deposit of osseous matter, that the slightest concussion is sufficient to cause the development of these bony growths, not only on bones but in the substance of tendons and ligaments; and the affection is often hereditary. When the growth takes place in the cavity of a bone, as in the cranial cavity, it has been called en-

EXOSTOSIS

EXPOSITION

ostosis, but with doubtful propriety, because in this case the growth is upon the bone and outside of its structure. The prognosis varies, principally in proportion to the rapidity of the growth, which when very slow may not be much regarded, except when interfering with the functions of some important organ, as a joint, or into the cranial cavity. The treatment also varies with the prognosis. Often the removal is not a matter of moment, as exostoses may be carried through life without much inconvenience; and the removal may be a hazardous undertaking, as when the tumor encroaches upon a joint whose cavity would become opened by the operation. If the circulation in an important artery is impeded, removal becomes desirable, and should be undertaken when there is reasonable hope of a successful result. Topical applications are often beneficial, and in the earlier stages, in the form of blisters and strong counter-irritants, often effect the removal by absorption. A strong tincture of iodine, or a solution of iodine in iodide of potassium, is often very serviceable. The constitutional treatment, particularly when syphilis has preceded the affection, should not be neglected. Preparations of mercury may be cautiously administered, particularly the iodide, and iodine may be given in combination with potash or soda salts. When much pain is experienced, anodynes may be administered, either by the mouth or topically.

EXPOSITION, the property displayed by matter of enlarging in bulk by diminution of pressure, increase of heat, or in a few instances by increase of cold, and also of moisture. It is seen in solids in the common operation of setting the tire of a wheel; the iron ring, being heated in the circle of burning chips and coals, enlarges in bulk so as easily to slip over the felly, which it compresses tightly as it grows cool on the application of cold water. It is seen in liquids in the rise of mercury in the thermometer; and in aéiform bodies in the ascending currents of heated air, or more plainly in the bursting of a tight bladder as the air it encloses swells by exposure to heat. The amount of expansion exhibited by different bodies by any given increase of heat is very various. Those only which exist in the aéiform state, or as vapors, can be classed together in this respect. They all expand very nearly if not exactly alike by the same increase of temperature. Like air they increase in bulk from the freezing to the boiling point, so that, according to Gay-Lussac, 100 measures at the lower degree fill 120 ⅔ at the higher. For each degree of Fahrenheit the expansion of air, according to the accurate determinations of Regnault, is, under a constant volume, 4°F of its volume; for the less condensable gases it is perceptibly larger. Each solid body has its own rate of expansion, which however is not uniform for equal increments of temperature, but increases at high degrees in a faster ratio. This, unless special allowance is made for it in the graduation, in-
introduces error in thermometers, those marked off in equal divisions for the high degrees evidently not being correct. Another source of error in these instruments is the unequal expansion of the different materials. The mercury from the freezing to the boiling point of water expands, according to Regnault, in volume 1 part in 55.08; between the latter and 392°, 1 in 54.61; and between this and 573°, 1 in 54.01. Glass expands in the same range of temperature, in the first division, \(1 \times \frac{1}{55.08}\); in the second, \(1 \times \frac{1}{54.61}\); and in the third, \(1 \times \frac{1}{54.01}\). In a mercurial thermometer it is the difference of expansion between the mercury and the glass that is indicated, and the temperature indicated by 586° would correspond to 667° determined by the expansion of glass alone, or to 672° by the air thermometer. Various instruments called pyrometers have been devised to determine high degrees of temperature by the amount of expansion of bars of different metals. They are all approximate only in their results, unless the rate of expansion of the metal bars has been accurately investigated by the help of the air thermometer; and the labor attending such a study has rarely been bestowed upon these instruments, which in every form are now generally superseded by the air thermometer itself or by the electric pyrometer of Siemens. (See Pyrometer, and Thermometer.) The expansions of various solids from 32° to 212° are presented in the following table:

The expansion in bulk is found by measurement to be about three times the linear expansion, as it should be on geometrical principles of the relations between the side and the volume of a cube. When metals become liquid by fusion, a change takes place in their density; their specific gravity increases in the cases of iron, bismuth, and antimony, as is shown by solid pieces floating upon the surface of a melted mass of the same metal. Thus it is that in castings the mold is entirely filled in its minutest parts. On the other hand, phosphorus, mercury, gold, silver, copper, and many other substances contract as they become solid; and this is the reason why coins of the last three metals cannot be cast, but require to be stamped. A great difference is shown in the amount of expansion of different liquids; thus water gains \(\frac{1}{4}\) in bulk when its temperature is raised from 32° to 312°, oil of turpentine \(\frac{1}{4}\), and mercury in a glass tube \(\frac{1}{4}\). A remarkable exception to the general law of expansion of liquids in proportion as they are heated \(\frac{1}{4}\) shown in the case of pure water. When this is cooled from the temperature of 60° it continues to contract until it reaches 35°. From this point it expands until it freezes at 35°, its rate of expansion being about the same from 35° whether it is heated or cooled; but if kept perfectly quiescent, Despretz found that below 35° water retains its liquidity and continues to expand. He gives the following determinations:

An important beneficial effect of this peculiarity in the expansion of water is seen in the protection it affords to the natural bodies of this fluid, as lakes and ponds, against being frozen throughout. For, as the surface of the water is cooled below 35° by the cold air above, this portion by its expansion becomes specifically lighter than the water below, and consequently remains at the top. At 35° a covering of ice forms over the water, which being a poor conductor of heat preserves the great body of water from falling to a lower temperature than 35°, the point of its greatest density. The passage from the liquid to the solid state on the abstractions of heat is determined to a very considerable extent by the superficial tension of the liquid; thus Despretz finds that in fine capillary tubes water may be cooled to -20° C. (-4° F.) without solidification. So great a power is exerted by the contraction of metals on cooling after being expanded by heating, that this has been applied as a mechanical force, as in the bringing together of heavy walls of buildings which had separated by unequal settling. Strong iron bars are passed horizontally through the opposite walls, and being heated throughout their length are closely keyed up and then allowed to cool; and the process is repeated until the desired effect is obtained. This suggests the danger of inserting bars of metal closely in walls of masonry, as the force exerted by their expansion tends to thrust portions of the wall out of place. The expansion of water has been practically applied to the rendering of rocks, the fluid being poured into the fissures and allowed to freeze. This is one of the most efficient agents employed by nature for the disintegration of rocky cliffs. The expansion by access of moisture is exhibited in the swelling of the fibre of wood or of
ropes. This, too, is sometimes employed as a powerful mechanical force, as by inserting wedges of wood into cracks, or into holes drilled for the purpose in rocks, and then covering the wood with water. As this is absorbed, the wood slowly expands, exerting a steady pressure of surprising force. The presence of moisture in the atmosphere is ascertained by instruments based on this principle. (See Hydrometry.) For the effect of expansion of steam, see Steam.

EXPLOSIVES. An explosion may be occasioned by the sudden removal of resistance to an expanding force, as in the case of steam boilers; but it is more frequently the result of a sudden generation of energy by chemical reactions. Most explosions of this kind are instances of rapid combustion; and an explosive compound, as distinguished from a merely inflammable one, may be defined as one which contains within itself the elements of combustion or other chemical change, liberating mechanical energy. Thus the fire damp of coal mines, when pure, is inflammable; but mixed with a certain proportion of atmospheric oxygen, it becomes explosive. The ingredients of an explosive compound remain inert until the condition of chemical reaction is supplied. This is usually heat, produced by the direct contact of a heated body, or by pressure or percussion. In some instances, however, the introduction of a new substance, or the change of aggregate condition in one or more of the ingredients, may occasion explosion. The number of explosives known to chemists is considerable. Chiefly those which are employed in the arts will be considered in this article.—Gunpowder. Of these, gunpowder is the most widely employed, partly because the longest known, but mainly because it is not liable to spontaneous change, or explosion from other causes than a very high temperature (that of a spark or flame, for example), and because the manufacture can be cheaply carried on to any required extent, and can be so varied as to control the qualities of the product according to the proposed use. Gunpowder presents to the eye a mass of grains, usually angular and of uniform size, dark color, and polished surface. The different varieties range from 0·5 to 4·5 mm. in diameter of grain. Its specific gravity is 1·8 to 2·0. It explodes when rapidly heated above 500° C. It is composed of charcoal, sulphur, and nitre, the two former being the combustible ingredients, and the latter, by the surrender of its oxygen, supporting their combustion. According to the theory formerly held, the nitre is reduced during the combustion of rifle powder to nitrogen and potassium, the latter forming with sulphur potassium sulphide, while all the oxygen combines with the carbon of the charcoal to form carbon dioxide (carbonic acid). The formula expressing this reaction would be $2KN + S + 3CO = KS + CO_2$, and the proportions of ingredients in 100 parts would be: nitre, 74·94; sulphur, 11·84; charcoal, 13·22. From blasting powder, on the other hand, carbonic oxide as well as carbonic acid is formed, and the theoretical reaction is shown in the equation $KNO_3 + S + 2C = KS + N_2 + CO_2 + CO$, requiring the proportions: nitre, 64·4; sulphur, 20·4; carbon, 15·2. How nearly these formulas are adhered to will appear from the following tables of analyses:

These variations are due partly to the variable quality of the ingredients, particularly the charcoal, which always contains water and ash. The best coal (from light non-resinous wood, like poplar, black alder, or willow) rarely contains over 85 per cent. of carbon. The composition of powder has been also varied from the theoretical formulas to obtain a variety in its effects, and the researches of Bunsen, Shiakoff, Karoly, Craig, and Fedorow have shown that the simple reactions upon which the formulas were based do not take place; that the products of combustion, which vary somewhat with the pressure under which ignition takes place, comprise, among the gases, small quantities of carbonic oxide, hydrogen, sulphured hydrogen, and free oxygen, and, in the smoke and residue, chiefly the sulphate and carbonate, not the sulphide, of potassium. From these gases from rifle powder to be but 81·4 per cent. of the weight. The pressure generated by the com-
bustion of gunpowder has been variously estimated. Gitzachmann gives the following table, compiled from different authorities:

The usual estimate at present is for rifle powder 4,000, and for blasting powder 2,000 atmospheres. It is believed that in practice half these figures are realized. The latest researches upon the heat set free by the combustion of powder, those of Roux and Sarrau (Comptes Rendus, July, 1878), give the following results:

The time within which this pressure is developed is an important element in the practical effect. The particles of the powder are successively ignited and combustion becomes general. The rate of ignition is more rapid, and that of combustion is slower, the larger the grain of the powder. The finest-grained powder, when pressed closely together, behaves like a single mass, burning with comparative slowness, and hence showing less explosive power. It is employed in rockets and fireworks. For rifle guns, a coarse grain is now preferred, since its quick ignition gives the force required to press the projectile into the grooves, while its prolonged combustion augments the pressure under the projectile leaves the gun with maximum velocity. Blasting powder, which is required to lift and split, rather than to throw, is usually coarse-grained, though modern practice is tending to the employment of "quicker" powders; a change due to the observed effectiveness of the nitro-glycerin compounds. The composition of ordinary blasting powder, as above shown, affects a slow combustion.—A blasting powder now used to a considerable extent in this country contains Chil saltpetre (nitrate of soda) instead of nitre. It is unsuitable for sporting or military purposes. Another variation from the usual formula is Oliver's powder, made in Pennsylvania, in which peat is substituted for charcoal, with increased safety of manufacture and cheapness of product. The West Virginia mineral graminite, a hydrocarbon, has also been experimented upon as a substitute for charcoal, with favorable results. Common powder soaked at the moment of using in nitro-glycerin has been used in Swedish quarries, with trebled effectiveness. Dynamite is safer and better. Pyronene is a cheaper, inferior blasting powder, made of 52.5 parts nitrate of soda, 20 parts sulphur, and 27.5 parts spent tan. In Davey's powder a part of the charcoal is replaced by flour, starch, &c., for safety in preparation. Slow-burning powders used in Germany (Neumann's, Klip's, &c.) contain less sulphur and more coal than the ordinary kind. They are recommended for safety and small amount of smoke.—An intimate mixture of 3 parts nitre, 2 parts dry carbonate of potassa, and 1 part sulphur will when slowly heated (e.g., in an iron spoon) first melt, and soon after explode with deafening noise. The sulphur acts upon the carbonate of potassa, producing "liver of sulphur," a mixture of the sulphide with the nitrate of potassa; this is suddenly oxidized by the decomposition of the nitric acid, and nitrogen gas is liberated. The experiment should be tried with a small quantity only, say as much as will cover the tip of a knife blade. (See Gunpowder.)

Pyroxyline. In the explosives classed above under gunpowder, the sulphur plays part of a stimulant of chemical action, by its superior readiness to ignite. It is the nitric acid and the carbon which, forming voluminous gases, generate the explosive force; and these substances can be brought together in such ways as to form explosive compounds which have the advantage of leaving no solid residues or smoke. Pyroxyline is the name given to the class of detonating substances produced by the action of concentrated nitric acid upon the cellulose of cotton, hemp, paper, sawdust, &c. Gun cotton was discovered in 1846 by Schönbein, and also by Boëttger. The conversion of cotton into gun cotton by the action of nitric acid scarcely changes its outward appearance. Chemically, it contains much hyponitric acid. It will ignite at 50° to 150° C, and leaves no residue after explosion. Its effectiveness is variously estimated at from two to six (probably four) times that of gunpowder. According to the best modern formula, gun cotton is trinitro-cellulose, C₆H₃(NO₂)₃O₆. The products of combination are entirely gaseous. Károlyi gives the following, in 100 parts:

When burned under pressure, the nitric oxide reacts more completely with the carburetted hydrogen, and the result of this and other
causes is a greater volume of evolved gases. The actual product of heat units as compared with the combustion of gunpowder is proportional, according to Dr. Craig, to the respective amounts of oxygen concerned in the two cases; but the greater volume of the gases from gun cotton renders their temperature lower and their mechanical effect greater. This material burns without explosion when ignited in the open air. Ordinary percussion sometimes ignites it—a source of peril in packing bore holes.

The acid and aquesous gases which it evolves have prevented its use in ordnance; moreover, it is very hygroscopic and liable to spontaneous decomposition, sometimes leading to explosion, rendering its storage perilous. Many of these objections, together with that of bulk, have been removed by Abel's process of manufacturing gun cotton in compressed solid cylinders, which burn harmlessly, can be stored and transported with safety, and explode with great power when ignited under confinement by means of a detonating powder. The experiments of Gen. Lenk, in Austria, led to this improvement. The compressed gun-cotton is adopted in that country for artillery. Gun cotton is used as a filter for strong acids, and also (dissolved in ether) as a varnish. (See Cotterrow, and Guy Cotton.)—Xyloidine is the white, pulverulent, and very explosive substance obtained by Bracqnonet in 1885, by treating starch with concentrated nitric acid. Lithofracteur is the name originally given to a white blasting powder, consisting of coarsely ground saltpetre and sulphur, with a third substance, supposed to be sawdust or bran, treated with nitric acid. The improved lithofracteur described below is a different substance.—Schultz's chemical powder, sometimes called wood gunpowder (introduced in 1864), contains no sulphur; and the charcoal is replaced with wood which has been trituated, deprived of its acids, soluble salts, proteine, and albumen, and treated with concentrated sulphuric and nitric acid. These grains of wood are subsequently saturated with nitrate of potash or baryta, or both, and dried. The powder can be wet and dried again without weakening it; hence it may be kept or transported in a damp state with perfect safety. It is about one third as dense as gunpowder, is more powerful, and leaves but a trifling residue. But it seems to have been superseded by nitroglycerine compounds. Some inexplicable explosions have occurred with it. The gases produced from it in mining have been complained of, possibly without good reason.—Haloxylina is a powder tried in Austria, which contains no sulphur, and in which the charcoal is apparently represented by woody fibre. Like the slow-burning Neuemeyer powder, it gives comparatively little noxious gas, is hygroscopic, and works better in solid than in fissured rocks. It is asserted to burn harmlessly in the air; but like many other "harmless" powders, it has given rise to some strange and disastrous explosions. The above account of its composition follows the Österreichisches Zeitchrift (1866 and 1867); Wagner's "Technology" (1870) says it contains charcoal, nitre, and yellow prussiate of potassa.—Nitro-glycerine. This substance, known also as fulminating oil, nitroleum, trinitrine, glyceryl nitrate, and gionoine, and undoubtedly the most important explosive since gunpowder, was discovered in 1847 by Sombrero, then a student with Pelouze in Paris. It is formed by treating glycerine with concentrated sulphuric and nitric acid. (See Glycerine.) Until 1864 it found no practical application, except as a homopathic remedy for headaches similar to those which it causes. In that year Alfred Nobel, a Swede of Hamburg, began its manufacture on a large scale, and, though he sacrificed a brother to the terrible agent he had created, has persevered until in its later and safer forms nitro-glycerine has come into wide use and popularity. It is a clear, oily, colorless, odorless, and slightly sweet liquid, heavier than water and insoluble in it, but soluble in ether and methyl alcohol; crystallises in long needles at 4° to 11° C. At 15° C. it becomes after a while thick; prolonged exposure to —8° C. solidifies it. It detonates in the open air, under a strong blow or shock; ignites with difficulty when poured out in a thin sheet, and even then burns incompletely without explosion. It can be evaporated at 100° C., if boiling is avoided; but boiling, or the temperature of 160°, causes an explosion. Confined or frozen, so as to permit the instantaneous transmission of an impulse through the mass, it will explode, sometimes under a very slight shock. It is usually exploded with a detonating fuse. When badly prepared or preserved, it is liable to decomposition, yielding gases which exert a pressure within the containing vessel and create a condition of perilous sensitiveness to external shocks. The modern formula is C\textsubscript{5}H\textsubscript{8}N\textsubscript{2}O\textsubscript{5}, or C\textsubscript{5}H\textsubscript{4}O\textsubscript{5}O\textsubscript{4}; hence it is glycerine, H\textsubscript{2}C\textsubscript{3}H\textsubscript{3} (NO\textsubscript{2})\textsubscript{2}, in which 8 atoms of H have been replaced by 8 atoms of NO\textsubscript{2}. Its specific gravity is 1.6; and 100 parts yield on combustion:

100=129,800

According to L'Hôte, the oxygen is united with part of the nitrogen as protoxide. The heat liberated by the combustion is estimated to be twice as much as that of gunpowder; hence, while one volume of the latter yields in practice 200 volumes of cold gases, expanded by heat to 800 volumes, an equal weight of nitro-glycerine yields 1,396 volumes of gas, expanded to 10,864 volumes, giving 18 times the force of gunpowder. But the explosion takes...
place much more suddenly than that of gunpowder; hence the practical gain in effect is greater than the above figures show. The suddenness with which the force is developed renders nitro-glycerine unsuitable for ordnance. The very dangerous character of this material has led to various restrictions upon its transportation. It continues to be used in many places, and is prepared on the spot as it is required. In the Hoosac tunnel, Massachusetts, the United States works at Hallett's Point, New York, and at San Francisco, it was employed. Its insolubility in water and its liquid form and high gravity render it very convenient for submarine operations and blasting in wet ground. But its form brings a danger that portions of it, unexploded even in bore holes, may be scattered in rock fissures, or portions may be split accidentally, or may remain in vessels once filled, and afterward be exploded by accident. The proper way to get rid of it is to pour it into a running stream. To remove the great dangers connected with the preparation and transportation of this material, many propositions have been made, principally for mixing the oil with some substance (wood spirit, sulphate of zinc, lime or magnesia, &c.) which would render it insensitive, and which could afterward be removed by simple means (e.g., by water) when the oil was to be used. None of these have come into use. When concealed it has been thought more dangerous than when solid; but this view is now contradicted by many practical authorities. Certainly careless handling and thawing of frozen nitro-glycerine has caused much loss of life and property. Through the pores or in the stomach, even in small quantities, this oil causes a terrible headache and colic. Headache likewise results from inhaling the gasses of its combustion; but all persons are not alike affected by these; and it is probable that most persons suffer little inconvenience from this cause when they have become accustomed to it.—Nobel introduced in Swedish quarries the practice of soaking common gunpowder with nitro-glycerine before blasting. The effect produced was very great; but this method was soon superseded by the invention of dynamite or giant powder, also introduced by Nobel. Dynamite is finely pulverized silex, or silicious sables, or infusorial earth (most frequently the last), saturated with about three times its weight of nitro-glycerine, and constituting a mass resembling damp Graham flour. The pulverulent form prevents the transmission of ordinary sudden shocks, except under pressure in a confined space. The pressure of the insert mineral constituents serves also to absorb heat, so that a high temperature cannot be so easily imparted to the whole; but when imparted, this temperate suffices for great expansion of the gasses and increased effectiveness of explosion. Ignited in the open air, dynamite burns quietly with nitrous fumes. Exploded (usually by means of a fulminating fuse or cap), it gives carbonic acid, nitrogen, and hydrogen, and leaves a white ash, with little or no smoke. Under favorable circumstances, the effectiveness of dynamite is equal or superior to that of nitro-glycerine; a fact not surprising, if it be remembered that the latter is liable to scatter unexploded drops, by reason of the maximum rapidity of its ignition. Dynamite is now generally recognized as the safest of all explosives. It is not affected by a prolonged temperature of 100° C., nor is it as dangerous as nitro-glycerine when it solidifies (at 8° C.). Neither light nor electricity nor ordinary shocks cause it to decompose or explode. The principal dangers connected with its use are those of the strong fulminating powders used in the percussion fuses to explode it. It is also possible that if dynamite is carelessly made, it may contain an excess of nitro-glycerine, which, overcoming the capillary force of the mineral particles, may collect in drops and settle from the mass, becoming a source of serious accidents. Moreover, it may be that freezing, or thawing after freezing, has a tendency to segregate the oil.—Dittmar, introduced in 1869 by Lange, and Dittmar, is another nitro-glycerine powder, consisting probably (the exact composition is a secret) of Schultze's wood gunpowder, saturated with this oil. Another formula is, in 100 parts, 50 of nitro-glycerine, 80 of fine sawdust, and 20 of nitre. It has been considerably used in Germany and the United States. As compared with dynamite (which it resembles in many respects), it has the advantage that it can be exploded under confinement with an ordinary blasting fuse; that it does not congeal so easily as dynamite; and that it is cheaper. As a disadvantage, Serlo mentions, that under some conditions it partially explodes, partially burns, and in this case produces noxious gases.—Improved lithofracteur, or lithofracteur-dynamite, manufactured by Krebs at Dentz near Cologne, is supposed to be the former lithofracteur saturated with nitro-glycerine. Another formula is, in 100 parts, 53 of nitro-glycerine, 80 of silex, 12 of stone coal, 4 of nitrate of soda, and 2 of sulphur. This would be a mixture of dynamite with a very bad gunpowder. The safety and effectiveness of dynamite are claimed for this powder, with an additional advantage that it can be exploded at much lower temperature—as low, according to some experiments, as 18° C.—Nobel has recently patented new nitro-glycerine powders, of different degrees of strength. The strongest consists of 68 parts nitrate of baryta and 12 parts rich bituminous coal, saturated with 12 parts nitro-glycerine. Nearly as powerful is a mixture of 70 parts nitrate of baryta, 10 parts resin, and 12 parts nitro-glycerine. The effect of each may be increased by adding 5 to 10 parts. They are exploded with percussion fuses.—Dr. Justus Fuchs, formerly in Nobel's employ, has proposed as an improvement on dynamite a compound containing 85 instead of 75 per cent. of nitro-glycerine, and instead of infusorial
Explosives

earth a chemically prepared substance, possessing greater absorbing power, and capable of complete combustion with almost no solid residue.—The Colonia powder, manufactured in Cologne, is said to be a black gunpowder, with 80 to 93 per cent. of nitro-glycerine. It is exploded by artificial means only.—Chlorate of Potassa Powders. The property of acids containing large proportions of oxygen to part with it readily is strongly shown by chloric acid, HClO₃, in which the oxygen is very loosely held. The anhydric acid cannot be isolated; but the salts (particularly of potassa and baryta) have been extensively employed in the manufacture of explosives, by mixing with combustible materials. Even the heat of percussion or friction causes them when so mixed to detonate. A few centigrams of chlorate of potassa rubbed in a mortar with sulphur or sulphide of antimony, will explode loudly and perhaps shatter the mortar. A chlorate should never be mixed by rubbing with a combustible substance. A mixture of chlorate of potassa with sugar, sulphur, sulphide of antimony, or similar substances, may be ignited by sunlight alone, or by a drop of sulphuric acid. On this principle were based the matches (now out of fashion) which were dipped with a mixture of chlorate of potassa and sugar, and were ignited by pressing them upon asbestos, saturated with sulphuric acid. During the French revolution, it was attempted to replace nitre in gunpowder with chlorate of potassa; but the mixture was too explosive for artillery purposes. Berthollet's experiments at Essonne, in 1792, were stopped by a terrible explosion; he had a narrow escape, and several were killed. A cane, striking powder on the floor, was the cause. Percussion caps were formerly filled with gunpowder out of which the nitre had been leached, and to which this chlorate had then been added. Sir William Armstrong uses a mixture of ammonium phosphorus, chlorate of potassa, and charcoal as a percussion powder for discharging ordnance. A mixture of equal weights of black sulphide of antimony and chlorate of potassa is generally employed for this purpose.—White gunpowder, introduced in 1849 by Augendre, for bronze ordnance and shells, is composed of 28 parts yellow prussiate of potassa, 28 parts loaf sugar, and 40 parts chlorate of potassa. According to Wagner, the gaseous products of complete combustion should be 47.4 per cent., and the solid residue (cyanide and chloride of potassium and carburet of iron) 52.6 per cent. The gases from 100 grammes would amount, at 0° C. and 769 mm. barometric pressure, to 40,880 cubic centimetres; and at 2604° 5° C., the estimated temperature of combustion, to 481,162 cubic centimetres. The cost and corrosiveness of this powder have prevented its adoption. Blake's "safety explosive," patented in England, consists of one part sulphur and two of chlorate of potassa. These substances are kept dry and separate, and mixed when required. The powder burns slowly when ignited, but its explosion is effected by means of a detonating tube, containing the compound itself, fulminating mercury, and ordinary powder. The last is ignited.—A blasting powder is made at Plymouth, England, consisting of tan bark soaked in chlorate of potash and covered with powdered sulphur. It is said to burn slowly in the open air, but to explode with great energy when confined.—Explosive paper is prepared by impregnating paper with a mixture of 9 parts chlorate of potassa, 41 of nitre, 81 of ferrocyanide of potassium, 31 of powdered charcoal, 15 of starch, 15 of chromate of potassa, and 90 of water which has been boiled about an hour. The paper, when dry, cannot be exploded by jar or percussion, or by a temperature less than that of its combustion. Experiments with it in Austria have given good results.—Chloride of Nitrogen is perhaps the most terrible explosive known to chemists. Dulong, who discovered it in 1812, and lost an eye and several fingers on the occasion, kept the discovery a secret, lest other chemists should repeat his perilous experiments. The unfortunate result was that Davy, who subsequently made the same discovery, was also injured. It is sometimes unintentionally produced in the treatment of ammonical solutions with chlorine. In such cases the chemist, having discovered its presence, quietly retires, locks the laboratory, and leaves the dreadful intruder to spontaneous and harmless decomposition, which takes place in the course of a day or two. Hypochloric acid, in gas or liquid form, is scarcely less dangerous.—Picroate of Potash Powders. Picric acid, obtained by the action of nitric acid upon carboxylic acid, is a compound of carbon, nitrogen, hydrogen, and oxygen, the formula, as given in Wagner's "Technology," being C₆H₃(NO₂)₃O. Its salts are explosive per se, and have been used in torpedoes. Their preparation has given rise to some frightful explosions; one at the Sorbonne, in 1869, killed five persons, and wounded many more. Desseignolle's powder for blasting is a mixture of picroate and nitrate of potassa, to which for a gunpowder charcoal is added. Sulphur is unnecessary. The advantages claimed for it are the harmless character of the products of combustion (nitrogen, aqueous vapor, and carbonate of potash), and the control of its power by variation of the percentage of the picroate. Ten grades are manufactured, containing from 8 to 20 per cent. of this substance, the lowest being equal in effectiveness to common powder.—Ammoniakrut is a new powder invented by the Swedish chemist Norrbin, and believed to resemble the foregoing, but to contain picroate of ammonia instead of potassa. It is black, doughy, and flammable, with difficulty by flame; it explodes under percussion; does not congeal at ordinary temperatures; has an explosive energy exceeding even that of dynamite; but is said to be liable to decomposition, to attract moisture and lose power when stored, and to
be useless if once frozen. It leaves no solid residue. — *Fulminates.* The compounds of cyanogen comprise many highly explosive substances, among which the fulminates, or salts of fulminic acid, are the most important. Fulminic acid (Lat. *fulmen*, a thunderbolt) is, according to the most modern formula (Kekulé's), a nitro-comound of the group C₂H₅N (acetanilid), and hence called nitro-acetonitril. One of the hydrogen atoms is replaced with an atom of NO₂, giving for the acid C₆(NO₂)₃H₅N. In the salts the hydrogen is replaced with a metal; thus the fulminate of silver is C₆(NO₂)₃AgN. This hypothesis explains the fact that the fulminates react very differently from the cyanates (mono-, di-, and tribasic), all of which have the same proportions of C, N, and metallic base, but doubtless different atomic arrangements. Mercury fulminate (empirical formula, C₂N₅O₄Hg) is prepared by dissolving at a moderate heat, in 12 parts of nitric acid of the specific gravity of 1.35, 1 part of mercury, and adding 11 parts of 90 to 92 per cent. alcohol. Liebig recommends a glass flask, the capacity of which is 18 times the volume of the mixture. In this the mercury is dissolved in cold acid, the nitrous fumes being retained in the flask. The solution is poured into a second vessel, containing one half the alcohol; and the mixture is then returned into the first flask, where it reabsorbs the nitrous fumes. In a few moments bubbles rise from the bottom, where a heavy liquid begins to be segregated. By gentle shaking this is mixed with the supernatant liquid, and a tempestuous ebullition takes place, with evolution of white fumes, and some nitrous acid, the mass becoming black from segregated metal. The remainder of the alcohol is gradually added; the black color disappears, and the fulminate is deposited in sparkling brownish gray crystals. The vapors are chiefly carbonic acid and nitrous ether. Mercury fulminate is scarcely soluble in cold water, but dissolves in 180 parts of boiling water, which gives a means of refining it by recrystallization. It explodes at 186° C., or under friction or percussion between hard substances. When moistened with 5 per cent. of water, only a portion actually struck explodes. In contact with a tightly packed explosive mixture, its detonation explodes the mixture more rapidly and completely than any other method of firing. Hence its universal employment in the manufacture of percussion caps and detonating fuses. According to the French method, one kilo of mercury gives 1½ kilo of fulminate, sufficient for 40,000 caps. It is ground with 30 per cent. of water under a wooden muller on a marble bed, and 6 parts gunpowder are added for every 10 of fulminate. The mixture is dried, granulated, and sized. A drop of gum is introduced into each cap, and the fulminate powder is dropped upon it. Some caps are varnished, to make them water-proof. English fulminating powder consists of 8 parts mercury fulminate, 8 parts chlorate of potassa, 1 part sulphur, and 1 part powdered glass. Gum is sometimes added in the mixture. Nitro is also recommended. Samuel Guthrie of Sackett's Harbor, N. Y., whose extensive and perilous experiments are described in the "American Journal of Science" for January, 1852, found that 1 part oxide of tin with 3 parts mercury fulminate, ground together with a stiff solution of starch, made a very effective compound. During these experiments Mr. Guthrie discovered chloriform, as did French and German investigators at about the same time. Silver fulminate is more explosive and dangerous than the mercury salt. It may be made like the latter, using fine silver instead of mercury; or by introducing finely pulverized nitrate of silver into concentrated alcohol, shaking it well, and adding an equal amount of fuming nitric acid; or by treating freshly precipitated oxide of silver with ammonia. It is employed in the manufacture of explosive toys. Gold and platinum fulminates are similar compounds to the foregoing, but they are not employed in the arts. — *Fulminating aniline,* or chromate of diazobenzole, obtained by the action of nitrous acid upon aniline, and the precipitation of the product by the aid of a hydrochloric acid solution of bichromate of potassa, is, according to Caro and Griess, an efficient substitute for fulminating mercury. — General Theory of Explosives. Explosive substances are said to "possess potential energy by virtue of certain unsatisfied affinities between the elements of which they are compounded." In the act of explosion these affinities are satisfied, and the potential energy becomes kinetic, taking first the form of heat, which is partially expended in giving elastic force to the new gaseous compounds generated. Perhaps this statement does not exactly cover cases like the chloride of nitrogen, which explodes by dissociation, leaving free chlorine and nitrogen. The elastic force at any instant of an explosion and the total energy developed are two different things. The intensity of the force depends upon: 1, the amount of actual heat developed; 2, the volume which a unit of the mass of the products occupies at the instant; 3, the specific heat of these products; or, in other words, upon: 1, the volume of the products; 2, their temperature. The total energy is dependent upon: 1, the ratio between final volume of products and original volume of explosive; 2, the total actual heat of the explosion. The maximum intensity depends chiefly upon the rapidity with which the conversion of the explosive into gas takes place, and this depends on varying conditions, no explosion being absolutely instantaneous. The primary condition is the rapidity with which the chemical reaction among the constituents takes place. Some, as nitrate and chlorate of potassa, require heat for their decomposition; others are probably dissociated by the vibrations produced by percussion or the exploding spark, as nitro-glycerine and chloride.
of nitrogen. Some have so little stability that sound alone is sufficient to precipitate the explosion, as iodide of nitrogen, which may be exploded by sounding a tuning fork of the proper pitch in its vicinity. When heat is required, the rapidity of decomposition will depend also upon the rate of ignition throughout the mass. Thus in a charge of granular gunpowder, the flame from the vent passes between the grains, progressively enveloping their surfaces, and through the pores of each into the mass, its progress being much hastened by the enormous tension produced when the explosion is confined. Hence the rate of ignition (and consequently the intensity of the force at a given instant) may be varied by varying the size of pores and interstices in the mass; a fruitful field of experiment and improvement, particularly in gunpowder. It is evident also that the tension is dependent upon the resistance to the expansion of the gases, and will rapidly increase unless the restraint is withdrawn in proportion to their progressive development. The increase of tension brings with it increased rapidity of ignition and decomposition, and this in turn augments the tension, which is thus a self-multiplying quantity. Restraint may be offered by an enclosing solid material, or by the inertia of the gases themselves, and the surrounding air. If a block of compressed gun cotton is ignited in the open air by a flame, of moderate temperature, it will often consume away very gradually; but if ignited by an electric spark, or the impact of a bullet, it will explode with great violence; the probable explanation being that in the former case the first ignition at lower temperature permitted the gases to expand without producing a very high tension, this relation continuing to the end, while in the latter case the first ignition was violent, and the relief too slow to prevent a self-multiplying tension.

**EXPONENT** (Lat. *exponere*, to manifest), in arithmetic and algebra, a small figure or letter, written to the right of and above a quantity or algebraic term, to show how often the quantity or term must be taken as a factor. Thus, $8^3$ (which is read "the fourth power of 8," or "8, fourth power") signifies that 8 is to be taken as a factor four times, or multiplied into itself three times, as follows: $3 \times 8 = 9$; $3 \times 9 = 27$; $3 \times 27 = 81$. In like manner $(a+b)^n$ signifies that the sum of the numbers represented by $a$ and $b$ must be multiplied consecutively into itself as many times less one as there are units in $n$. (See ALGEBRA.)—Exponential equations and functions are those in which the exponents contain unknown or variable quantities; such as $y = a^x$, in which $a$ is the only known quantity. Exponential equations are usually reduced to logarithmic, and thus solved.

**EXPRESS**, a messenger or conveyance sent on any special errand, particularly a courier despatched with important communication. In the United States the word is applied to a system organized for the transportation of merchandise or parcels of any kind. This system was originated March 4, 1839, when, agreeably to announcement published for several days in the newspapers, Mr. William F. Harnden of Boston made a trip from that city to New York as a public messenger. His route was by the Boston and Providence railroad and the Long Island sound steamboat, which connected with that line. He had in charge a few booksellers' bundles and orders, and some brokers' parcels of New York and southern and western banks and merchants—such as which was a charge for which he charged an adequate compensation. Mr. Harnden proposed also to take the charge of freight, and attend to its delivery, for which purpose he had made a contract with the above named railroad and steamboat companies, and was to make four trips per week. The project recommended itself to business men, especially those whose communications between the two cities were frequent. It was particularly acceptable to the press, to which Mr. Harnden made himself very useful in the voluntary transmission of the latest intelligence, in advance of the mail. A year later (1840) a competing express was started by P. B. Burke and Alvin Adams, the ownership and sole operation of which soon devolved upon the latter. In 1841 Mr. Adams associated with himself William B. Dinmore of Boston as his partner, and gave him the charge of their New York office. Adams and co.'s express was carried by the Norwich and Worcester route. In 1840 D. Brigham, Jr., Harnden's New York agent, became his partner, and soon after went to England, where he laid the foundation of Harnden and co.'s foreign business. He returned in 1841, and in that year their line was extended as far south as Philadelphia, and west to Albany. A year or two later Adams and co. established E. S. Sandford as their agent in Philadelphia, and he became a partner in their business there. He also became associated with S. M. Shoemaker of Baltimore in an express from Philadelphia to Washington, D. C. About the same time Harnden and co.'s Boston, Springfield, and Albany express was purchased by Thompson and co., who gave it their name, which it still bears. About the same period Gay and co., afterward Gay and Kinsey, commenced what is now known as Kinsey and co.'s express, running between New York and Boston, via Newport and Fall River. The express lines from Albany to Buffalo, and thence to the remoter west, were established by Henry Wells. The first express west of Buffalo was commenced in April, 1845, by Messrs. Wells, Fargo, and Dunning, under the style of Wells and co. It was disposed of two years afterward to William G. Fargo and William A. Livingston, who continued it, under the style of Livingston and Fargo, till March 16, 1860, when it was consolidated with the express of Wells and co., and Butterfield, Wason, and co. The
express line last named had been created about a year previous by John Butterfield. These three concerns, when united, were called the "American Express Company." William F. Harnden, the founder of the express business, died in 1848, leaving little or no property. In the mean time numerous short express routes and local express had come into successful operation throughout New England. Messrs. Pullen, Virgil, and Stone, who by their efficient services had contributed largely to the success of Harnden's business in its infancy, now started an express between New York and Montreal, and laid the foundation of the "National Express Company." Wells, Fargo, and co.'s California express was created in the city of New York in 1853. Adams and co.'s California express, established in 1849, was succeeded in 1855 by that of Freeman and co. In 1854 Adams was succeeded by Harnden express (then owned by Thompson and Livingston), Kissley and co., and Hoey and co. were consolidated in a joint stock institution, now famous as the "Adams Express Company." The "United States Express Company" was commenced in 1858. It runs a through express twice a day to Buffalo, over the New York and Erie railway, and thence to numerous western cities, towns, and stations. Between New York and Dunkirk, and at all the stations upon its route, the New York and Erie railway company does an express business which was first established by the regular express company last mentioned. The "Hope Express Company," the "New Jersey Express Company," and the "Howard Express Company," established as joint-stock concerns since 1854, were founded upon successful individual enterprises of some years' standing prior to that date. They serve every part of New Jersey and Pennsylvania. The "Eastern Express Company" also is a union of several individual enterprises, consolidated Jan. 1, 1857. Its principal office is in Boston, whence its lines diverge by various railroad and steamboat routes into Maine and New Hampshire. Fiske and co., and Cheney, Fiske, and co., are proprietors of expresses which have been very useful in Massachusetts, New Hampshire, and Vermont. Massachusetts is remarkable for the number of its expresses, the most of which have short routes, and are operated by individual enterprise; 288 run from the city of Boston alone. The "American-European Express and Exchange Company," created in New York, July 1, 1855, was founded upon the business of Livingston and Wells, and Edwards, Sandford, and co. It sends and receives an express by every regular line of foreign steamships, and transacts business in London, Paris, and all the European cities.—The principal companies which are at present (1874) doing business in the United States are the Adams express company, the American, the United States, Wells, Fargo, and co., the southern express company, the national express company, the New Jersey, the eastern, the United States and Canada, and the Texas. The railroads covered by the expresses are about 60,000 miles in length, but as they are traversed in both directions and often several times each day, it is estimated that the express messengers travel more than 300,000 miles daily. The whole number of men employed in the United States by all the expresses is over 15,000, the number of horses is about 8,500, and the number of offices about 8,000. The amount of capital employed in the business is estimated as being not less than $25,000,000. The whole of this amount is not needed for the purpose of supplying material or for carrying on the business, and the larger part is held by the companies as a provision against any losses that may be sustained. The public in its dealings with the companies has therefore the protection of a large guarantee capital in addition to the individual responsibility of the shareholders. Confidence is reposed in express companies to such an extent that in times of financial panic, when merchants and others have for the time lost confidence in their banks and bankers, they trust the express companies in their fiduciary capacity and make use of them for the purpose of making their remittances and collections. A peculiar feature in trade has grown out of express facilities, called the "Collect on delivery business." Merchants whose wares are advertised or known now receive orders from strange firms in distant parts of the country to send goods to them by express, to be paid for on delivery. The merchant fills the order and sends the goods with his bill addressed to the consignee, marked O. O. D., and the amount to be collected, on the outside of the package. This is sent to its destination by the express company and tendered to the consignee, with the bill. Upon payment of the latter the goods are delivered to the new owner, and the money received is carried back to the consignor, who pays for the collection, while the consignee pays the freight on the package. The amount of business transacted in this way is very large and rapidly increasing.

**EXTRADITION**, the delivering up of fugitives from justice by the authorities of one country or state to those of another. This subject may be considered under two heads, as it relates to the surrender of offenders to each other by the several states of the American Union, or to the like mutual surrender between sovereign nations. I. **Between the States of the Union.** This is provided for by the constitution, art. IV. § 2 of which declares that a person charged in any state with treason, felony, or other crime, who shall flee from justice and be found in another state, shall, on demand of the executive authority of the state from which he fled, be delivered up to be removed to the state having jurisdiction of the same. An act was passed by congress in 1793 to carry this provision into effect, and to establish the like regulation for the territories; and the several states have also statutes on the same subject. The
general course under these statutes is the following: The accused is either indicted in the state where the crime is alleged to have been committed, or he is charged with the offence before a magistrate, who, after examining into the case, and being satisfied by evidence that the charge is well founded, issues his warrant for the arrest. A copy of the indictment or warrant is then presented to the executive of that state, who will give a formal requisition upon the executive of the state to which the accused has fled for his surrender. The executive upon whom the requisition is made, if the papers appear to be regular and sufficient, issues his warrant in compliance, directed to an officer or to the agent of the state making the requisition, which will be authority for the apprehension and removal of the accused.

Some statutes authorize the supposed fugitive to be first complained of, examined, and committed where he is found, to await a requisition from the proper executive. It is settled under the constitutional provision cited above that persons are liable to extradition under it who having committed offences in one state are found afterward in another, whether their going to such other state was for the purpose of avoiding punishment or not; but it is also settled that one cannot be extradited to a state where he is not alleged to have been when the crime was committed. Thus, when Smith, the Mormon prophet, was charged with having in Illinois been accessory to the attempt upon the life of Gov. Boggy in Missouri, it was decided that he could not be regarded as a fugitive, and consequently could not be surrendered. The most important controversy under this provision has been as to the offences covered by it. It has been sometimes insisted that only those acts were to be considered crimes within its intent which were such at the common law, or at least which were punishable as crimes in the state upon which the demand was made; and cases occurred in which governors in the free states refused to surrender persons who were accused in the slave states of offences against the slave code. The last of these cases arose in 1859-60, when a demand was made upon the governor of Ohio by the governor of Kentucky for the surrender of one Lago, who was accused of the crime of seducing a slave to escape from her master. The demand was refused, on the ground that the act was not an offence known to the laws of Ohio. Application was then made to the supreme court of the United States for a mandamus to compel a surrender; but that court, while declaring its opinion that the words "treason, felony, or other crime," as employed in the constitution, include every offence forbidden and made punishable by the laws of the state where the offence was committed, at the same time decided that the court had no power to compel the performance of executive duties by the governor of a state. Since the abolition of slavery, no similar controversy is likely to arise.

II. EXTRADITION BETWEEN SOVEREIGN NATIONS. As a general rule, one nation does not undertake to punish offences not committed within its territories, though the offender may be found there. Many publicists, however, have expressed the view that nations owe to each other the obligation to surrender offenders who might have fled to them for an asylum; but this obligation, if it exists, must be regarded as imperfect, and as requiring stipulations to determine the occasions in which it may arise, and the manner of its exercise. Accordingly, though the extradition of offenders has been practised by some countries on grounds of comity only, it is now customary to make the obligation one of compact, in which the respective parties stipulate to what offences it shall apply, and what exceptions, if any, shall be made. There are two methods of making such compacts: one by legislation, where a country provides by its own laws that persons accused of offences abroad shall be subject to extradition on condition of reciprocity; the other by convention or treaty. The latter is the method usually adopted. In making such treaties it is customary to provide that they shall not apply to offences previously committed, or to those of a political character; though independent of any such express stipulation such cases, we think, must be considered impliedly excepted. It is sometimes provided, also, that the contracting nations shall not be bound to surrender their own subjects, though this exception would not be likely to be insisted upon unless under very peculiar circumstances. The United States has taken the lead in diplomatic negotiations on this subject, and we now have treaties for the mutual rendition of persons accused of offences as follows: With Great Britain (including all its possessions): murder; assault with intent to commit murder; piracy; arson; robbery; forgery or the utterance of forged paper. (Treaty of Aug. 9, 1842. This was an enlargement of Jay's treaty of 1794, which provided for the mutual rendition of persons accused of murder and forgery.) With the Hawaiian Islands: the same offences specified in the treaty of 1842 with Great Britain. (Treaty of Dec. 29, 1849.) With France: murder, comprehending the crimes designated in the French penal code by the terms assassination, parricide, infanticide, and poisoning; attempt to commit murder; rape; forgery; arson; embezzlement by public officers, when the same is punishable with infamous punishment; but this not to apply to offences previously committed, nor to those of a purely political character. (Treaty of Nov. 9, 1848.) To the above have been added robbery and burglary (treaty of Feb. 26, 1845); forgery or knowingly passing or putting in circulation counterfeit coin or bank notes or other paper current as money with intent to defraud; embezzlement when subject to infamous punishment; and the case of accessories and accomplices, as well as principals, is included.
(treaty of Feb. 10, 1858). With Prussia and the other states of the late North German Confederation: murder; assault with intent to murder; piracy; arson; robbery; forgery or the utterance of forged papers; the fabrication or circulation of counterfeit money; or the embezzlement of public moneys. (Treaty with Prussia of June 16, 1852, extended to all the states of the North German Confederation, Feb. 22, 1868. Similar treaties were made with Bavaria, Sept. 12, 1855; with Hanover, Jan. 18, 1855; and with Baden, Jan. 30, 1857.) With the Swiss Confederation: murder, including assassination, parricide, infanticide, and poisoning; attempt to commit murder; rape; forgery or the emission of forged papers; arson; robbery with violence, intimidation, or forcible entry of an inhabited house; piracy; embezzlement by public officers, or by persons hired or salaried, to the detriment of their employers, where these crimes are subject to infamous punishment. This not to apply to offences previously committed, or to those of a political character. (Treaty of Nov. 25, 1860.) With Venezuela: the offences specified in the treaty with the Swiss Confederation, with the addition of the counterfeiting of money, and with the like exception. (Treaty of Sept. 26, 1861.) With the Dominican Republic: the offences specified in the treaty with Venezuela. (Treaty of Feb. 8, 1867.) With Sweden and Norway: murder, including assassination, parricide, infanticide, and poisoning; attempt to commit murder; rape; piracy, including mutiny on board a ship whenever the crew or part thereof, by fraud or violence against the commander, have taken possession of the vessel; arson; robbery; burglary; forgery, and the fabrication or circulation of counterfeit money, whether coin or paper money; embezzlement by public officers, including appropriation of public funds. This not to apply to offences of a political character, or to any person who by its laws is a citizen or subject of the country on which the demand is made; and where the person demanded is charged with a new offence in the country in which he has sought an asylum, he is not to be delivered up until tried and acquitted or punished. (Treaty of March 21, 1860.) With Italy: murder, including parricide, assassination, poisoning, and infanticide; attempt to commit murder; rape; arson; piracy, and mutiny on board a ship, whenever the crew or a part thereof, by fraud or violence against the commander, have taken possession of the vessel; burglary; robbery; forgery and counterfeiting, and the uttering of forged or counterfeit papers, coin, or paper money; embezzlement of public moneys by public officers or depositaries, and embezzlement by persons hired or salaried, to the detriment of their employers when subject to infamous punishment according to the laws of the United States, and to criminal punishment according to the laws of Italy. (Treaties of March 22, 1868, and Jan. 21, 1869.) With Nicaragua: the same offences specified in the treaties with Italy. (Treaty of June 25, 1870.) With Austria: murder, assault with intent to murder; piracy; arson; robbery; forgery; fabrication or circulation of counterfeit money, whether coin or paper money; embezzlement of the public moneys. This not to apply to offences previously committed, or to offences of a political character, and neither to be bound to surrender its own citizens or subjects; and one accused of a new offence in the country to which he has fled, not to be surrendered until tried therefor and acquitted or punished. (Treaty of July 8, 1866.) With Mexico: murder, including assassination, parricide, infanticide, and poisoning; assault with intent to murder; mutilation; piracy; arson; rape; kidnapping, defining the same to be the taking and carrying away of a free person by force or deception; forgery, including the forging or making or knowingly passing or putting into circulation of counterfeit coin, or bank notes or other paper current as money; embezzlement of public moneys; robbery; burglary and larceny of cattle or other goods or chattels of the value of $25 or more, when committed in the frontier states or territories of the respective countries. This not to apply to offences of a political character, or to persons held as slaves when the offence is charged to have been committed, or to crimes previously committed; and neither party to be obliged to deliver up its own citizens. (Treaty of Dec. 11, 1861.) With Hayti: murder, including assassination, parricide, infanticide, and poisoning; attempt to commit murder; piracy; rape; forging and the counterfeiting of money, and the utterance of forged paper; arson; robbery; embezzlement by public officers or by persons hired or salaried, to the detriment of their employers, when these crimes are subject to infamous punishment. This not to apply to previous offences, or to citizens of the country on which the demand is made. (Treaty of Nov. 8, 1864.) Besides these, there are conventions for the mutual return of deserters from ships, and treaties under which various Indian tribes bind themselves to surrender offenders to the United States; and the Creeks and Seminoles and the United States agree to a mutual surrender of offenders against their respective laws.—The several treaties with foreign countries require that, when requisition is made for an offender, before the surrender for extradition a judicial examination should be had, and that the surrender should only be made on such evidence of criminality as would justify the apprehension of the person and his commitment for trial where he is found if the offence had been there committed. By acts of congress passed to give effect to the treaties, the hearing is to be had before a federal judge or commissioner, or before a judge of a state court, who, if he finds the proper case established, will certify the fact with the evidence to the secretary of state,
that an executive warrant may issue for the surrender to the authorized agent of the foreign government. The surrender cannot be made until the judicial determination shall be had. In the well known case of Jonathan Robbins, arising under Jay's treaty, the president, while the case was pending before a judge, interfered with his advice and request that the accused should be delivered up, which was done accordingly; but this raised in the country an outcry, and tended so strongly to the prejudice of the administration, that the like interference with judicial action is not likely again to occur. Nevertheless, the action of the judge is not conclusive on the executive; the one acting for the protection of individual right, while the other is to judge of the international obligation. While the executive cannot order the extradition until it is judicially determined that a prima facie case of guilt is shown, he is not on the other hand, compelled to issue the warrant of extradition in compliance with the finding of the judge, if in his opinion the case is not within the treaty under which the proceeding is assumed to be taken. Thus, in the noted case of Karl Voght (1878), who was first demanded by Belgium for an offence committed in that kingdom, but whose extradition was refused on the ground that we had no treaty with that country, and who was subsequently demanded for the same offence by Prussia on the ground of being amenable to its laws as a Prussian subject, the president, on the opinion of the attorney general that the case was not covered by treaty, refused to issue his warrant of extradition, notwithstanding that the district judge before whom he had been brought had determined that a case was made out, and had given the proper certificate. In the present followed the judicial decisions in England. The several states, not being at liberty under the constitution to form treaties or conventions with foreign powers, cannot surrender accused persons to those powers. Great Britain has treaties of extradition, besides that with the United States, with France, Denmark, Germany, Belgium, Italy, and Austria (1874). The first, dated Feb. 2, 1848, only embraces murder (including assassination, parricide, infanticide, and poisoning), attempt to murder, forgery, and fraudulent bankruptcy. That first made with Denmark included only the same four offences, but is now greatly enlarged, and, like those with Italy and Belgium, corresponds in comprehensiveness to the treaty with Germany of 1872. The offences specified in that are: murder; attempt to murder; manslaughter; counterfeiting or altering money, or uttering the same; forgery or the uttering of forged papers, bank notes, or paper money; embezzlement; larceny; obtaining money or goods by false pretences; crimes against the bankrupt laws; fraud by a balee, banker, agent, factor, trustee, director, member, or public officer of any company when made criminal; rape; abduction; child stealing; burglary or housebreaking; arson; robbery; theft by letter or otherwise with intent to extort; sinking or destroying a vessel at sea, or attempting to do so; assaults on board a ship on the high seas, with intent to destroy life or to do grievous bodily harm; revolt or conspiracy to revolt on board a ship on the high seas against the authority of the master. Extradition may take place for participation in any of the crimes specified, provided such participation be punishable by the law of both countries. By statute 83 and 84 Victoria, c. 59, contemplating further treaties of the same nature, it is provided that effect may be given to any such treaty by mere order in council, and without special parliamentary sanction, which otherwise would have been necessary. Most of the European treaties of extradition are very recent, and they are likely soon to be adopted among all Christian nations.

EXTREME UNCTION, a sacrament of the Roman Catholic church, and of the Greek and other eastern churches, administered for the spiritual and bodily relief of the sick. The Greeks call it the "oil of prayer." The Scriptural authority on which this rite is founded is taken from St. James v. 14, 15. In the Latin church it is called extreme or "last" unction, because, unlike the anointments of baptism, confirmation, and holy orders, this is reserved for the last hour. The effects of this sacrament are held to be the following: spiritual strength to overcome the enemies of salvation in the final struggle of the dying hour, and patience to support the pains and discomforts of illness; the indirect forgiveness of all mortal sins of which the sufferer may be unconscious, and the direct remission of venial sins; the removal of the weakness of the spiritual faculties caused by the habits of sin; and restoration to health when it is for the welfare of the patient. The sacrament is administered by the priest, who anoints with consecrated oil the eyes, ears, nostrils, mouth, hands, and feet of the sick person, praying at eachunction that the Lord by his mercy and through that unction will remit the sins committed through each sense.

The various eastern churches, Greek, Armenian, Coptic, and Nestorian, agree with the Latins in regarding this as one of the seven sacraments instituted by Christ; but they differ in that they do not reserve its use for the sick in danger of death. Moreover, in the Greek church it is sometimes administered by as many as seven priests at the same time, but ordinarily by two. The Greek form of words does not substantially differ from that employed by the Latins.

EVALET. See VILAVET.

EYCK, Van, the name of three painters, two brothers and a sister, regarded as the founders of the Flemish school, probably the children of Jossae van Eyck, a painter, and born at Eyck (now Alden Eyck), a village in the bishopric of Liége, near Maastricht, on the Maas. T.
Hubert van, born in 1686, died in Ghent, Sept. 18, 1436. After having resided for some time in Bruges, he removed with his brother to Ghent, where he was employed with him upon an altarpiece for the church of St. Bavon. He died before its completion, and was buried in that church. II. Jan van (often called Jan van Brugge), born about 1390, died in Bruges in 1440 or 1441. Much difference of opinion has prevailed in regard to the precise date of his birth, and as to which of the two brothers was the greater painter; but it would seem to be sufficiently well established that Jan was much younger than Hubert, and was instructed by him. Their most celebrated work was the altarpiece in the church of St. Bavon. It was about 14 ft. wide and 13 ft. high, and contained 13 pictures, painted upon folding doors or screens, representing the adoration of the mystical lamb, other pictures being painted upon the reverse of some of the doors. When the French obtained possession of Belgium, Napoleon caused the doors to be carried to Paris, whence they were removed in 1815. The four central divisions were restored to Ghent, and are now in the church of St. Bavon; the six most important of the doors were taken to Berlin, and form one of the finest ornaments of the royal museum; and two of the doors are in the museum at Brussels. A fine copy of the whole altarpiece was made by Michael Coccio for Philip II. of Spain, part of which is in the Berlin museum, part in the Pinakothek at Munich, and part in the church of St. Bavon at Ghent. The brothers made such great improvements in the art of oil painting that its invention has been often, though erroneously, ascribed to them. The mixture of oils and gums which they used as the vehicle for their pigments was so excellent that the colors of their great work still retain a wonderful freshness. They discarded the artificial style of their predecessors, and endeavored to reproduce the outlines and hues of nature. Although Jan adhered in his early efforts to the flat gold background which had before been customary, he afterward adopted a more natural grouping for his figures and natural scenes for a background. The example of the brothers exerted a great influence upon the painters of Germany, Italy, and Spain, and contributed to the emancipation of art from conventional traditions. Jan was the court painter of Philip the Good, duke of Burgundy, and in 1428, while the painting of the altarpiece was in progress, accompanied the embassy which was sent by him to Lisbon to see for the hand of the daughter of King John I. of Portugal. After the completion of the altarpiece in 1429, he returned to Bruges, and little is known of his subsequent life. III. Margaret van, died about 1430. She remained unmarried in order that she might devote herself to painting in connection with her brothers. There is in London a fine picture by her, in three parts, of the Madonna and child.

See Wagen, Ueber Hubert und Jan van Eyck (Breslau, 1822), and "Early Flemish Painters," by Crowe and Cavalcaselle (London, [1886]).

**EYE**

The organ of the special sense of vision, lodged in man in a cavity on each side of the upper portion of the face, called the orbit. The orbits have the form of a quadrangular pyramid of which the base is in front and the summit behind; their direction is horizontal, and their axes, directed backward and inward, would cross at or near the sella turcica of the sphenoid bone in the cranial cavity. They have four triangular surfaces, the upper formed by the orbital plate of the frontal and the lesser wing of the sphenoid bone; the lower by the palate behind, the upper maxillary in the middle, and the malar in front; the external by the sphenoid behind and the malar in front; the internal by the sphenoid behind, the ethmoid in the middle, and the lacrimal bone in front. The cavity has at its upper external portion a depression for the gland which secretes the tears, at its inner portion the commencement of the bony passage to the nose; at the summit is the round opening for the entrance of the optic nerve, the union of the sphenoidal, sphenomaxillary, and pterygomaxillary fissures, and the commencement of the suborbital canal. Besides these bony enclosing cavities, the eyes are protected from dust and foreign bodies by the hairs of the eyebrows above, and in front by the movable lids.

**Fig. 1.** Horizontal Section of the Eyeball.

Scl. sclerotic coat; Cn. cornea; R. attachments of the tendons of the rectus muscles; Ch. choroid; C.p. ciliary processes; C.m. ciliary muscle; I. iris; A.g. aqueous humor; Cly. crystalline lens; Vt. vitreous humor; Rt. retina; O.p. optic nerve; M.t. the yellow spot. The section has passed through a ciliary process on the left side, and between two ciliary processes on the right.

Fringed with the eyelashes. The globe of the eye is of a generally spherical shape, the anterior fifth being the segment of a circle smaller than that of the rest of the organ; the anteroposterior diameter, greater than the transverse, is 10 or 11 lines; differing from the axes of the
orbits, the axes of the eyes are parallel. In front, the globe of the eye is in relation with the reflection of the mucous membrane of the lids; behind and all around, with the muscles, vessels, nerves, and a cushion of soft fat. The eye is composed of membranes and humors. Of the membranes of the eye, the cornea has already been described under its own title; the others are the sclerotic, choroid, ciliary processes, iris, and retina. The sclerotic is the external membrane, forming the posterior four fifths, the anterior fifth being formed by the corneas; it is white, firm, and resistig, opaque, thick, and composed of interlaced fibers. Beneath the sclerotic is the choroid, composed of small arteries and veins united by delicate areolar tissue; it extends from the entrance of the optic nerve forward to the ciliary circle; both its surfaces are covered with a dark pigment, which gives the deep color seen in the interior of the eye. The ciliary circle or ligament is a grayish ring, a line or two wide, united by its larger circumference to the choroid, and by its lesser to the iris; the ciliary processes are membranous folds, 60 to 80 in number, extending from the choroid to the neighborhood of the opening of the pupil; they form by their union a ring behind the iris and in front of the vitreous humor, surrounding the crystalline lens like a crown. At a short distance behind the corneas is the circular, vertical, membranous curtain, the iris, pierced in the middle by the pupil; this curtain hangs in the aqueous humor, separating it into the anterior and posterior chambers of the eye; it presents anteriorly a great number of radiations converging toward the pupil, the muscular fibers for the dilatation of this opening, and is variously colored in different individuals; the posterior surface has a number of circular fibers for contracting the pupil, and is covered with a thick dark pigment layer called uvea; both surfaces are lined with the delicate membrane of the aqueous humor; the greater circumference is connected with the ciliary ligament and processes; its movements are doubtless partly owing to its erectile and vascular tissue. Beneath the choroid is the retina, a thin soft expansion of the optic nerve, surrounding the vitreous humor and extending forward as far as the ciliary processes and crystalline lens; about two lines to the outside of the tubercle of the nerve it presents a circular dark spot and a small perforation discovered by Sömmering. The retina is the immediate organ of vision, which receives the rays of light and transmits the visual impressions by the optic nerve to the sensorium. Of the humors of the eye, the crystalline lens has been described under that head; the others are the aqueous and vitreous humors. The aqueous humor is a limpid transparent fluid, varying in quantity from four to six grains, occupying the space in front of the lens which is divided into anterior and posterior chambers by the iris; it contains in solution a little albumen and the salts usually found in such secre-
when the accurate fitting of the latter allows it to be moved by the muscles acting in sympathy with the sound eye. — Without here treating of the laws of refraction, of the aberration of sphericity, and of other optical principles involved in vision, it will be sufficient to say that the rays from an object are first modified by the convex cornea, pass across the aqueous humor through the pupil-opening of the iris, thence through the dense crystalline lens and the vitreous humor, and are by these media of different densities and shapes converged at the proper focal distance on the retina. All rays beyond those necessary for perfect vision are absorbed by the pigment layer of the choroid, which answers the purpose of the black interior of optical instruments; the iris, like the telescopie diaphragm, shuts off the rays from the circumference of the lens, thus correcting the aberration of sphericity, contracting or dilating the pupil according to the brilliancy or dimness of the illumination of the object, or its distance from the eye; it is well known that the pupil of a cat in a bright light becomes diminished to a vertical slit. As the rays are crossed in the lens, an inverted image is formed on the retina, though the mental perception is of an erect image. Not only spherical but also chromatic aberration is corrected sufficiently for all practical purposes in healthy eyes by the different refractive powers of the media and by the different curves of their surfaces, so that the image on the retina is well defined and free from false colors. The power by which the eye adapts itself instantly to variations in the distance of objects depends upon a change in the curvatures of the crystalline lens, this body becoming more convex, and consequently more highly refractive, in vision for near objects, less so in vision for remote objects. The physiology and defects of vision will be more properly treated in the article Vision; for recent observations by Kolliker on the structure of the different layers of the retina, the reader is referred to the works of Dr. Carpenter on the principles of human and comparative physiology. The pupil is diminished by the action of muscles deriving their nervous influence from the third pair, but is dilated through the influence of the cervical portion of the sympathetic nerve. The movements of the eyeballs, whenever voluntary, are always harmonious, but not necessarily symmetrical; though one cannot be elevated and the other depressed at the same time, one may be turned outward

and the other inward when the axes of the eyes are turned toward an object on either side of the head. The muscles of the eyeball are moved principally through the third pair of nerves, the motore ocularis, but the superior oblique has a special nerve, the fourth pair, and the external recti the sixth pair; the sensibility of the eye is derived from the ophthalmic branch of the fifth pair; by the ophthalmic or ciliary ganglion the sensory branches of the fifth pair, the motor branches of the third pair, and the sympathetic filaments are united together. The vascular supply of the globe of the eye is derived from the ophthalmic branch of the internal carotid artery.—The complicated eye of the mammal and bird becomes more simple in reptiles and fishes, losing the eyelids, and in the articulates generally losing all that is anterior to the vertebrate crystalline lens, as well as mobility, the latter loss being supplied by the multiplication of the organs or facets. The mammalian eye is constructed to suit the circumstances of the life of the animal; of large size in ruminants and rodents, it is small in moles, bats, and cetaceans, and in the latter flattened anteriorly as in fishes. The eyes are generally placed laterally, but in the nocturnal species they are directed forward as in man; the lacrimal caruncle at the inner angle has in man only a rudiment of a nictitating membrane, which is more developed in some mammals, but remarkably in birds; the sclerotic is thicker in animals whose eyes vary much from a sphere, especially posteriorly, this membrane in a whale with an eye of the size of an orange being an inch thick behind; the choroid, dark in man, in the carnivora, ruminants, and other orders, reflects vivid metallic colors, remarkably brilliant at night, from the depth of the organ. In animals and man destitute of its usual coloring matter of the surface, or in albinoes, the iris is pink, from the color of the blood circulating in its vessels; during fetal life, until the end of the seventh month, the pupil is closed by a membrane. The foramen of Sömmering is said not to exist in any mammals below the quadruped; the tear gland is found in all except cetacea. In birds the sclerotic becomes more or less strengthened by cartilage, and in the neighborhood of the cornea is provided with a series of bony plates, arranged in a circle, and overlapping each other; but the chief peculiarity consists in the pecten, folded like a comb or fan, and projected forward toward the lens; it is vascular like the choroid, though not connected with it, and is dark with pigment; its use is not satisfactorily ascertained. Many species of reptiles have osseous pieces in the sclerotic; snakes have no movable lids; the chameleon has a single circular lid. In fishes the eyes are generally large, the sclerotic thick, and in some (as the tunny) osseous anteriorly; they have neither lids, except the most rudimentary, nor lacrimal glands; the cornea is very flat, and

Fig. 3.—Illustration of the change in the form of the lens when adjusted.—a to distant, b to near objects.
the lens dense; around the entrance of the optic nerve there is a very vascular, horse-shoe-shaped organ, between the lens and the choroid, called the choroid gland or muscle. The organs of vision in insects consist of simple or of compound eyes, the former occurring chiefly in larve, the latter in perfect insects; they are wholly absent in some larve, and both forms coexist in the perfect state of many. The simple eyes (ocelli or stemmata) consist of a convex cornea, behind which is a lens, lodged in an expansion of the optic nerve, and surrounded by a variously colored pigment layer; they vary in number from two to more than 100, and are situated on the head. The compound eyes are made up of simple eyes so closely placed that their facets or cornes are contiguous; behind each cornea is a transparent pyramid whose interior apex is received into a kind of vitreous body, surrounded by the nerve and the choroid; there are sometimes many thousand facets in these eyes, which may cover nearly the whole head, and hairs may project at their angles. In the arachnids the eyes are simple, and the orders have been characterized by their number, situation, and direction; they are most numerous in the scorpions. The sense of sight is present in almost all crustacea; their simple eyes consist of a cornea with a lens and pigment layer; a usual form is that of many simple eyes, placed close together, and covered by a common cornea; sometimes there is a faceted cornea under the simple one; the highest forms have compound faceted eyes, in many situated at or near the end of two peduncles movably articulated to the cephalo-thorax and concealed in special fossae; these facets are very numerous, and behind each is the usual lens and pigment. The eyes of cephalopods are very large and highly developed; resembling in some respects the vertebrate organ; there is generally an ocular bulb, and a capsule constituted by a cartilaginous orbit and a fibrous continuation of the cutaneous envelope, which takes the place of a cornea; semi-lunar folds containing muscular fibres cover the eye like lids; in front of the globe is a space analogous to an anterior chamber, containing a serous fluid, and in the cephalopods communicating externally; internally this chamber is closed by a kind of pupil; its serous membrane has a silvery lustre; in some species the lens is in direct contact with the water in which they swim; there is an iris, sclerotic, vitreous liquid, a spherical brownish lens formed of concentric layers, a ciliary body, and pigment layer; in the nautilus the eyes are placed on a projecting stalk, but in others are generally deeply sunk in the head. In the cephalopods (including pteropoda, heteropoda, and gastropodous mollusks) eyes are generally present, never more than two in number and comparatively small; they are almost always connected with the tentacles, either at their base, sides, or extremities. In acoelomous mollusks eyes are very common and numerous, occupying the borders of the mantle or confined to the orifice of the tube, and are either pedunculated or sessile. In the annelids the eyes are generally either wanting entirely, or are merely able to distinguish light from darkness; but the leeches have from two to ten undoubted eyes. In the helminths there appear to be no eyes, only pigment spots containing no light-refracting body. Below these are found in the radiata various eye specks and pigment dots which doubtless in some cases are true eyes, but authors are not yet agreed as to the light-refracting powers of most of these organs. The eye of the blind fish of the Mammoth cave, Kentucky, though unable to form a distinct image, can doubtless distinguish light from darkness through the areolar tissue and skin which cover it; Prof. J. Wyman has found in it a lens, sclerotic, choroid, retina, and optic nerve, and it is therefore constructed on the vertebrate plan rather than the invertebrate to which it has generally been compared; the parts in connection with the nervous system are developed, while those which are formed by inversion of the integuments are mostly absent; some authors are of opinion that the stimulus of light for several generations would retransform this eye into an ordinary organ of vision.

EYE STONE, the oocerculum or calcareous mouthpiece of certain species of small univalve shells. The stony-like substance, one third of an inch or less in its largest dimensions, presents a form like that of a turtle, a convex surface upon a plane base; and being placed on a smooth plate in a weak acid, as lemon juice, the evolution of carbonic acid gas from the carbonate of lime of which it is composed lifts it up and causes the stone to move about as if alive. A similar effect resulting from chemical decomposition is sometimes observed in animal bodies; and leaves of bread, Humbold remarks, have been observed to move in like manner in the oven, when the ovens have been called enchanted. He found the little oecercula, called piedras de los ojos, or eye stones, regarded as great mysteries by the inhabitants of the coast of Venezuela near Cumana. They collected them in great quantities on the beach at Cape Araya, and made use of them to extract dust or any foreign substance from the eye, a purpose for which they are still collected and exported, and are kept by druggists. Being introduced under the lid of the eye, the stone moves about by the motion of the organ, and any little particles it comes in contact with adhere to it and are finally removed with it; or the eye is either pedunculated.

ELYAU, or Elais, a town of Prussia, province of East Prussia, in the district and 92 m. S. S. E. of the city of Konigberg; pop. in 1871, 8,723. It is situated on the Pasmar, a small tributary of the Alle, contains an old castle, and has manufactories of cloth, hats, and leather. Here on Feb. 7 and 8, 1807, was fought a battle
between the French under Napoleon, 88,000 strong with 350 guns, and the Russians and Prussians, 78,000 strong with 460 guns. The total number of killed and wounded was nearly 40,000, and both sides claimed the victory.

In this battle Napoleon was nearly made prisoner, but was saved by his own presence of mind and the heroism of his little body guard of 100 men.—This town is called Preussisch Eylau, to distinguish it from Deutch Eylau, a small town of West Prussia, in the district of Marienwerder, 70 m. S. S. W. of the former, at the S. extremity of Lake Geserich.

EZEKIEL, the third of the great Hebrew prophets, and contemporary with Jeremiah and Daniel, lived in the 7th and 6th centuries B.C. He was still young when he went into captivity, following King Jehoiachin to Babylonia. There, on the banks of the Chebar, supposed to be the Chaboras in Mesopotamia, in the fifth year of his exile, he began his prophetic career, declaring to his fellow exiles the misfortunes which were besetting and threatening Jerusalem and the country of Judah. In the 27th year of his exile he described the new temple which was to rise in Jerusalem after the redemption of his people. This is one of the last prophecies remaining from him, and there is no account of him beyond the 27th year of the captivity of Jehoiachin. According to a doubtful tradition, he was assassinated by one of the exiled princes, and during the middle ages his tomb was pointed out between the Euphrates and the Chebar. His book, which abounds in visions, poetical images, and allegories, is divided into three parts: the first (ch. i. to xxiv.) was written before the destruction of Jerusalem; the second (ch. xxv. to xxxii.) contains prophecies against foreign nations; the third (xxxii. to xlviii.) foretells the resurrection of Israel and the erection of the new temple. The genuineness of the book has never been doubted; but a correspondent Hebrew text is among the most corrupt of the books of the Old Testament. The best commentaries are those of Umbreit (1848), Hävernick (1843), Hitzig (1847), and Ewald (3d ed., 1888).

Ezra, a Jewish scribe and priest, according to Josephus, high priest of the Jews in Babylon. Under his guidance, the second expedition of the Jews proceeded from Babylon to Palestine, under the reign of Artaxerxes I., about 458 B.C. The important services rendered by Ezra to his countrymen on that occasion, and also in arranging and settling the canon of Scripture, are especially acknowledged by the Jews, so that he is even regarded as the second founder of the nation. Josephus says that Ezra died at Jerusalem, and was buried there with great magnificence; according to others, he returned to Babylon and died there, at the age of 120. Ezra is said by some of the rabbis to have introduced the present square Hebrew characters, and, in conjunction with some of the elders, to have made the Masora, the punctuation and accentuation of the Bible. Besides the book of Ezra, he was supposed to be the author of the two books of Chronicles, and some writers attribute to him also the books of Nehemiah and Esther, though they differ in style from his acknowledged writings.

The book of Ezra contains an account of the favors bestowed upon the Jews by the Persian kings, the rebuilding of the temple, the mission of Ezra to Jerusalem, and the various regulations and reforms introduced by him. The theologians of the liberal school generally attribute the last revision of the book to a later hand than that of Ezra. Bertheau (in Schenkel's Bibellexikon, 1886) puts the date of the last revision about 300 B.C.; others, after the example of Spinoza, in the time of the Maccabees.

Parts of the book are written in Chaldee (iv. 8 to vi. 18, and vii. 12 to 26). For a full discussion of the questions relating to the book of Ezra, see the introductions of Berthold, De Wette, Keil, and Hävernick, and the commentary of Bertheau (1863).—In ancient manuscripts there are four books of Ezra, viz., the one just spoken of, the book of Nehemiah, and the two books which in the English version are called 1st and 2d Esdras, and placed among the apocryphal books. (See ESDRAS.)

EZZELINO (or Ecelino) DA ROMANO, a leader of the Ghibellines in Italy, born at Onaro, April 26, 1194, died at Soncino, Sept. 26, 1239. He belonged to a German family which in the 11th century had acquired large feudal possessions in Lombardy, and whose principal seat was the castle of Romano near Padua. He was the fourth of his name, and is known in history as Ezzelino the Tyrant. From his youth he entered into the quarrels of the time, and war having become general in Lombardy, he remained faithful to the emperor Frederick II. His lands being ravaged by the Guelphs, he invited the help of the emperor, who relieved him and gained noteworthy advantages. In 1236 Ezzelino, with his brother Aldo, gained possession of Verona and Vicenza, and he became podestà of Verona, and his brother of Vicenza. In February, 1237, after the return of the emperor to Germany, he took Padua. He subsequently captured Treviso, and imprisoned many eminent people on suspicion of disaffection to him; and from this time his oppression and cruelty became conspicuous. The emperor returned with reinforcements, and they gained the victory of Cortenuova, Nov. 27, 1237. The following spring he married a natural daughter of Frederick. In 1239 he was excommunicated by the pope. In 1240 he was intrusted with the conduct of the war in Lombardy, and lost Ferrara; but in 1246 he repulsed the marquis of Este, and subsequently he took Verona, feltre, Belluno, and even Este. By 1260, when the emperor died, he had extended his control from the Adriatic to the suburbs of Milan. A league was formed against him in 1252 by most of the Lombard cities, the marquis of Este, and others, including his own brother Aldo, and in 1256 a
crusade was proclaimed against him; but he
still successfully resisted all combinations, and
in the latter year he besieged Marlia. A new
league being formed against him, which was
joined by Venice, the allies invested and cap-
tured Padua, which was held by his nephew
Ansedio. But Ezzelino defeated the army of
the league near Brescia, and captured that city

sept. 1, 1258. In 1259 he threatened Milan,
but it was saved by Martin della Torre; and
Ezzelino's retreat being cut off, he was
forced into a battle near Soncino, in which he
was severely wounded and captured (Sept. 16),
and his army dispersed. He refused food, tore
the bandages from his wounds, and died without
reconciliation to the church.

F

F is the 6th letter of the English and Latin,
the 20th of the Arabic, and the 23d of the
Persian alphabet, indicates a labio-dental
sound, produced by the passage of the expired
air between the lower lip and the upper in-
cisive teeth, while the glottis and larynx are
almost at rest. Quintilian calls this sound
"scarcely human," since it is a mere affix, and
is wrongly placed among the semi-vowels.
Its sonorous parallel is the softer sound of V
(as in English), in producing which the glottis
and larynx are engaged. F is represented in
ancient Greek both by the φ (ph) and the di-
gamma, in corresponding words; but the sound
of the former was less harsh and rather as-
pirated than blowing (affixus), and the latter
sounded almost like our V. The figure of the
Latin F arose from the doubling of the Greek
Γ. The emperor Claudius is reported to have
used it inverted (ɔ) to represent V. As a
numerical sign for 6, the stigma was employed
by the Alexandrines, as one of the three ιεριγμα,
instead of this digamma, which is named λαυ
or λαος. The shape of the stigma (c) is an in-
verted Osic or Umbrian F ( 돌아). We find the
prototype of our cursive f on ancient Hebrew
coins; but in the present so-called Hebrew, as
in the Syriac, Sabæic, Palmyrenic, and some
other kindred writings, the ϱαυ takes the place
of F, and indicates the sounds of ρ and ύ. F
occurs in the same place also on the Italic tablet
of Cypros, in Lycean, also in Taurik (Berber),
and in some other writings. In the
Cyrillic alphabet the phert and phic (φ) cor-
respond to it as the 27th letter, in Glagolitic as
the 26th, and in Russian as the 27th. F is the
first rune, and it is represented hieroglyphi-
ically by a horned snake. It is often vicari-
ously converted into other letters or sounds,
especially into labialis, as in the following ex-
amples: Lat. frater, frango, fugas, Eng. brother,
break, beech; Lat. pes, pugnare, porcarius, Eng.
foot, fight, Ger. Bock; Lat. ferrum, fili-
us, fio, tux, fugas, formam, fabulati, fames,
fortari, Span. (since the 14th century) hierrae,
hiho, ha, ha, huer, hermoe, hablar, hambre, hur-
tar. The Greek φ the Italians, Spaniards,
and Portuguese uniformly replace by f. F
sometimes also interchanges with gutturals, as
Germ. Schacht, Eng. shaft; Dutch achter, Eng.
after; Germ. kriechen, Eng. creep and crafty.
In English and French it alternates with v
in grammatical forms, as wife, wives; nativ
nave. The Greek ϑ sometimes becomes f, as
Theodoros, Russ. Fedor; ᶷpa, ᶷpa, Lat.
fores, fora. Very peculiar are the transforma-
tions of the Latin f (also pi) into Spanish ñ
and Portuguese ch; as famma, Spæn. llama,
Port. chama, &c. The Devanagari, and
most graphic systems of eastern Asia derived
from it, have no F. The sound exists in the
Chinese and Japanese languages. Most Amer-
ican languages are guttural, and lack among
others the sound of f. As a numeral in the
middle ages, F was equivalent to 40, and f to
40,000. It signifies 80 in Arabic, and 10,000
in Armenian. Its substitute φ stands for 500
in Russian and Georgian; while the Phoenician,
Chaldaic, and Syrian ραα, or ρααα, indicates 5. As
an abbreviation, F stands for filius, feicit, Flavius,
Fahrenheit; for forte in music, and ff for
fortissimo. F is marked on the French coins
of Angers, on the Prussian of Magdeburg,
and on the Austrian of Hall in the Tyrol. In
music, it denotes the fourth diatonic interval,
or the sixth string on the piano in the chromatic
scale, and is called Fs in the solfeggio.

FABER, Frederick Wheat, an English clergy-
man and author, born June 28, 1815, died Sept.
26, 1868. He was educated at Oxford, and
became rector of Elton in Northamptonshire,
which office he filled until his conversion to
the Roman Catholic faith, which was formally
consummated Nov. 17, 1845. His published
writings up to that time were as follows:
(1839); "A Sermon on Education" (1840);
"The Cherwell Water Lily and other Poems"
(1840); "The Styrian Lake and other Poems"
(1842); "Sights and Thoughts in Foreign
Churches" (1842); "Sir Lancetol, a Poem"
(1844); "The Rosary and other Poems" (1845);
and several papers in the "Life of the English
Saints," edited by the Rev. Dr. Newman. Dr.
Faber was ordained priest in 1847, joined Dr.
Newman, who had just transplanted the Or-
atory of St. Philip Neri to England, and in 1848
received the habit of that congregation, and
did: become distinguished as an earnest and eloquent
preacher. His published writings after his
conversion are as follows: "Catholic Hymns,"
and an "Essay on Beatification and Canoniza-
tion" (1848); "The Spirit and Genius of St.
Philip Neri" (1850); "Catholic Home Mis-

sions" (1851); "All for Jesus" (1854); "Growth in Holiness" (1855); "The Blessed Sacrament" (1856); "The Creator and the Creature" (1857); "The Foot of the Cross, or the Sorrows of Mary," "Sir Lancelot," (being his former poem rewritten), and "Ethel's Story Book" (1858); and "Spiritual Conferences" (1859). Several years before his death he became superior of the Oratory at Brompton.

—See Bowden's "Life of F. W. Faber" (1869).

**FAVER, George Stanley**, an English theological writer, uncle of the preceding, born Oct. 25, 1773, died near Durham, Jan. 27, 1854. He studied at the university of Oxford, where he became a fellow and tutor of Lincoln college, was appointed Bampton lecturer in 1801, and in the same year published his discourses under the title of *Hercus Mosaicus* (2d ed. enlarged, 1818). He took the degree of B.D. in 1808, married, gave up his fellowship, and for two years assisted his father, the rector of Calverley in York, as curate. He subsequently occupied various vicarages, in 1831 was made prebendary of Salisbury, and in 1832 appointed master of Sherburn hospital. He wrote a large number of works, most of which, particularly those on prophecy, in which he holds that the inspired predictions apply not to individuals but to governments and nations, have had a wide popularity. Among the most important are: "Dissertation on the Mysteries of the Cabiri, or the Great Gods of Phoenicia" (3 vols. 8vo, Oxford, 1808); "The Origin of Pagan Idolatry" (3 vols. 8vo, 1816); "Difficulties of Romanism" (8vo, 1826); "The Sacred Calendar of Prophecy" (3 vols., 1829); "Papal Infallibility" (8vo, 1851); and "The Revival of the French Emporership anticipated from the Necessity of Prophecy" (12mo, 1853; New York, 1859).

**FABIUS**, the name of an ancient Roman gens, which claimed to be descended from Hercules and the daughter of the Arcadian Evander. Of the various families which belonged to the gens Fabius, the most ancient was that of the Vibulani, three brothers of which were consuls for seven years in succession (485-479 B.C.). These brothers rendered themselves odious to the common soldiers by refusing to divide among them the booty gained in war, and by their opposition to the agrarian law, but afterward became popular by their courage in a battle fought with the Veientes in the consularship of Marcus Fabius, in 480. In this battle Quintus Fabius was killed, and his brothers Marcus the consul and Cesio were foremost in the fight. The soldiers bravely supported them, and after the battle the Fabii espoused the cause of the plebeians and were regarded by the patricians as apostates. They gained high honor by offering to undertake alone the war against the Veientes. The whole family, with the exception of a single member, to the number of more than two thousand, perished with their wives and children. The bodies were fortified upon the banks of the Cremera, and prosecuted the war with great energy. But in the consulship of Horatius (477) Pulvillus and T. Menenius Lanatus they were all, after heroic resistance, overwhelmed and destroyed. The only member of the family who survived was Quintus, son of Marcus, who had remained at Rome, and from him were descended the Fabii who afterward became famous in Roman history. Among them, Quintus Fabius Rullianus is commonly considered the first who had the cognomen Maximus. In 325, as master of the horse, he gave battle to the Samnites, contrary to the express orders of the dictator L. Papirius Cursor, and obtained a signal victory. After other brilliant victories, in 295, being consul for the fifth time, he was in command at the great battle of Sentinum, and defeated the combined armies of the Samnites, Gauls, Etruscans, and Umbrians. He is reputed among the most eminent of the Roman generals, but the principal authorities in regard to this period belonged to the Fabian house, and it is probable that his military achievements have been much exaggerated. According to Polybius, it was not Q. Fabius Rullianus upon whom the cognomen of Maximus was originally conferred, but his great-grandson, Quintus Fabius Maximus Verrucosus, who by his prudent generalship in the second Punic war saved the Roman commonwealth from impending ruin. Having been appointed dictator after the defeat of Lake Thrasymeneus, in 217, he perceived that it was impossible with raw and disheartened troops to oppose successfully a veteran army flushed with victory. He therefore avoided pitched battles and moved his camp from highland to highland, where Hannibal's Numidian horse and Spanish infantry could not follow him. He thus tired them out with marches and counters marches. This policy gained for him the title of *Cunctator*, delay, It was admirably suited to the position of affairs, but the Roman senate and people were impatient under it, and divided the command between Fabius and Minucius, his master of the horse. Minucius made a rash advance, was surrounded by the enemy, and would have been destroyed had he not been rescued by Fabius. Varro, one of the consuls who assumed the command after the expiration of Fabius's dictatorship, disregarded his counsels and suffered a severe defeat at Canne (216). After this Fabius suggested the measures of defence which were adopted by the senate. He was made consul for the fifth time in 209, and became princeps senatus. During this year he inflicted a severe blow upon the Carthaginians by the recapture of Tarentum. Toward the end of the war the more energetic plan of action proposed by Scipio prevailed over the advice of Fabius. He died at an advanced age in 208, when Hannibal was about leaving Italy.

—Caius Fabius Pictor painted a battle piece to celebrate the victory of Fabius over the Romans, the scene of which is supposed to have been the battle of 302 B.C., the earliest Roman painting of which there is any record. It was preserved till the
time of the emperor Claudius, when the temple was destroyed by fire.—His son Numerius Fabius Pictor is mentioned by Cicero as an author of Greek annals, but was possibly mistaken for his nephew (a grandson of the painter), Quintus Fabius Pictor, the first prose writer of Rome, who served in the Gracian war, 226 B.C., and in the second Punic war. He was the author of a history of Rome from its foundation to his own time. Of this work, probably written in Greek, which was highly valued by later writers, no fragments remain.

FABRE, François Xavier Pascal, a French painter, born in Montpellier, April 1, 1766, died March 12, 1827. He was a pupil of David, and produced in 1787 a painting representing the “Execution of the Children of Zedekiah by order of Nebuchadnezzar,” for which he received the grand prize of the academy, and was sent as a pensionary to Rome. He was belied, though perhaps erroneously, to have been secretly married to the countess of Albany, who on her death in 1824 made him her sole heir, and bequeathed to him valuable MSS., which had been left to her by Al inspector. Fabre gave them to the city of Florence.

FABRE, Jean, surnamed “the honest criminal,” a Protestant hero, born in Nîmes in 1727, died in Cette, May 31, 1797. He was a manufacturer and a member of the small Protestant community at Nîmes. He and his coreligionists celebrated the new year of 1786 in a secluded locality, where they were surprised by the soldiery, but he escaped. His father, however, having been arrested, Jean took his place as a prisoner in the galleys of Toulon, and was subjected to great hardships. His release in 1769, and his full pardon in 1768, were mainly due to a play by Fenuillot de Falibaire, L'honnête criminel, of which he is the hero. His autobiography, written by his son, was published with a biographical notice by Anthanase Commes in the Bulletin de la société de l'histoire du protestantisme français (Paris, January to April, 1865).

FABRE D'ÉGLANTINE, Philippe François Nazaire, a French revolutionist and author, born in Langnedoc, Dec. 28, 1755, guillotined in Paris, April 5, 1794. In gratitude for a wild rose (églantine) of gold awarded to him in early life at the floral games at Toulouse, he adopted that name. He wrote a variety of plays for the theatres of Paris, a few of which, as Le Philinte de Moitié, L'intrigue épistolaire, &c., were favorably received. On the outbreak of the revolution he associated himself with Danton, whose secretary he became in 1792. He was a member of the convention, where he advocated the most violent measures, but played only a secondary part. He was accused of venality, and doomed to share the fate of Danton and his followers. Fabre d'Églantine was sentenced to death, but his writings were circulated among the populace. One of his comedies, Les précepteurs, was produced for the first time five years after his death, and received with great applause.

Two volumes of his writings were published in 1801 as Œuvres posthumes et mêlées.

FABRETTI, Raffaele, an Italian antiquary, born in Urbino in 1618, died in Rome in 1700. At the age of 18 he went to Rome, where he made himself profoundly acquainted with the literature and art of the ancients. After filling a diplomatic mission in Spain, he became treasurer of Pope Alexander VII., and under the three succeeding popes held various offices at Rome, Madrid, and Urbino. During his 13 years' residence in Spain he explored nearly all the antiquities of that kingdom. His first archæological works, De Aquaductibus Vetus Roma and De Columna Trajana, excited a general interest. His interpretation of certain passages of Livy involved him in a violent discussion with Gronovius. In a learned work upon ancient inscriptions he made known the treasures discovered by him in the catacombs of Rome. His rich collection of antiquities is still in the ducal palace of Urbino.

FABRIANO, a town of central Italy, in the province and 84 m. S. W. of the city of Ancona, at the foot of the Apennines; pop., about 6,000. It is the seat of a bishop, has a cathedral and several convents, and is celebrated chiefly for its paper and parchment. It is believed to be one of the first places at which paper from linen rags was manufactured. The town also contains tanneries and powder mills, and manufactures cloth and hats.

FABRIANO, Gentile da, an Italian painter of the Roman school, born at Fabriano about 1870, died in Rome in 1450. Michel Angelo said that his name Gentile, the noble or delicate, was in harmony with the character of his works. About 1418 he painted in the cathedral of Orvieto a Madonna, which still exists, and which was so much admired that the artist received the title of magister magistrorum. He then went to Venice, where he obtained great success, and was invited to Rome, where his paintings in the church of St. John Lateran, which his infirmities did not permit him to finish, made him esteemed the first painter of Italy. His manner resembles that of Fra Angelico.

FABRICIUS (Caesius Fabricius Luscus), a Roman statesman, celebrated for his virtue and integrity. While consul in 282 B.C. he defeated the Lucanians, Bruttians, and Samnites, and enriched the public treasury with more than 450 talents from the spoils of the enemy, remaining poor himself. In 280 he served as legate in the campaign against Pyrrhus, king of Epirus, to whom he was sent at its close with an embassy, to ask the ransom or exchange of some Roman prisoners of war. The meeting of the envoy and the king at Tarentum has perhaps been embellished by the Roman historians; but it is very probable that they had to have withdawed not only the most splendid offers of Pyrrhus, who knowing his poverty tried to bribe him into his service, but also the threatening aspect of an elephant seemingly
let loose upon him. In reward of his integrity the king allowed the captives to go to Rome for the celebration of the Saturnalia, on promise of returning after the festival. In 279 Fabricius fought in the battle of Asculum, which, though nominally a victory for Pyrrhus, was regarded by him almost as a defeat. In the next year he commanded again as consul, and exposed to his enemy the treachery of his physician, who offered to poison him; upon which Pyrrhus is said to have exclaimed, "It is easier to turn the sun from its career than Fabricius from his honesty," and to have freed all his captives without ransom. When Pyrrhus evacuated Italy, Fabricius was engaged in subduing his allies. As censor in 275 he deprived P. Cornelius Rufinus of his seat in the senate, for having in his household 10 pounds of silver plate. Like Curius Dentatus, he scorned the presents of the Samnite ambassadors, and died so poor that the senate had to provide marriage portions for his daughters. He was buried in Rome, and his urn lies in the cloisters of S. Pudenziana, the prohibitory law of the twelve tables having been suspended in his honor.

FABRICIUS, Georg, a German scholar, born in Chemnitz, Saxony, April 24, 1616, died in Meissen, July 13, 1751. He was director of the college of Meissen. His edition of Horace (2 vols., Basel, 1655) is still esteemed. He wrote Latin poetry with great purity, and in his sacred poems he would employ no words which had the slightest flavor of paganism. Baumgarten-Crusius wrote a sketch of his life and writings (Meissen, 1889).

FABRICIUS, or Fabrizio, Girolamo, surnamed from his birthplace AB AQVAEPENDENTAE, an Italian anatomist and surgeon, born at Aquaequenten, in the Papal States, in 1567, died in Padua, May 31, 1619. A pupil of Fallopio, he succeeded him as professor of anatomy and surgery at the university of Padua, which position he held for 50 years. Fabricius was the first to demonstrate in 1574 the presence of valves in the veins of the extremities. William Harvey, who was his pupil, acknowledged himself indebted to his teachings for the discovery of the circulation of the blood. His writings comprise dissertations on the formation of the foetus, the structure of the esophagus, stomach, and body, and the peculiarities of the eye, ear, and larynx; treatises on the egg and on veins, &c. Great honors were bestowed on him by the Venetian government, and a large anatomical theatre was constructed for his accommodation. The first edition of his surgical works appeared at Padua in 1617. An edition of his anatomical and physiological works was published by Bohn in Leipsic in 1687, followed in 1727 by the more complete one of Albinus of Leyden.

FABRICIUS, Johann Albert, a German bibliographer, born in Leipsic, Nov. 11, 1668, died in Hamburg, April 80, 1736. He studied philosophy, medicine, and theology, and in 1699 was appointed professor of rhetoric and moral philosophy in the gymnasium of Hamburg. The extent of his learning in almost every department of knowledge, especially in philology, was remarkable. His most celebrated works are: Bibliotheca Latina (Hamburg, 1697; 5th ed., 3 vols., 1721; new ed. by Ernesit, 3 vols., Leipsic, 1773-4); Bibliotheca Graeca (14 vols., Hamburg, 1705-28; continuation and new edition by Harless, 12 vols., Hamburgo, 1790-1809, provided with an index in 1838); Bibliographia Antiquaria (Hamburg, 1718; new ed. by Schafhausen, 1760); Bibliotheca Ecclesiastica (Hamburg, 1718); and Bibliotheca Media et Inflormi Ztatis (5 vols., Hamburg, 1734; supplementary vol. by Schöttgen, 1740; new ed. by Mansi, Padua, 1764).

FABRICIUS, Johann Christian, a Danish entomologist, born in Tondern, Schleswig, Jan. 7, 1748, died in Kiel in 1807 or 1808. His academic studies were pursued at Copenhagen, Leyden, Edinburgh, and finally at Upsal, under Linnaeus. He was much attached to the great Swede, and has preserved some interesting details of his private life. He adopted Linnaeus's method, and introduced a system of classifying insects by the parts which constitute the mouth. He took the degree of doctor of medicine about 1767, and was afterward appointed professor of natural history in the university of Kiel, where he wrote his Systema Entomologia (1775), subsequently enlarged into Entomologia Systematica (4 vols. 8vo, Copenhagen, 1792-4). He employed the remainder of his life in developing and perfecting it, and for this purpose made tours over different parts of Europe. His Genera Insectorum (8vo, Kiel, 1777), Philophusia Entomologica (Hamburg, 1778), Species Insectorum (2 vols., 1781), Mantisse Insectorum (3 vols., Copenhagen, 1767), and other works show how complete and extensive were his investigations in this branch of science. He also published essays on botany and natural history, accounts of travels in Norway, Russia, and England, and a variety of treatises, historical, political, and economical, relating to Denmark, the latter being prepared by him in his capacity of councillor of state and professor of rural and political economy at Kiel. He died of grief, it is supposed, occasioned by the imprisonment of Copenhagen, and the political misfortunes of Denmark.

FABYAN, or Fabian, Robert, an ancient English chronicler, born in London about 1450, died in 1512. He was a merchant, became an alderman and sheriff of London, and wrote a general chronicle of English history, which he called the "Concordance of Histories," from the fabulous exploits of Brutus in Great Britain to the reign of Henry VII. It was first published after the author's death (folio, 1516), and reappeared in numerous editions, the last of which is that by Sir Henry Ellis, accompanied by notes and a learned introduction ("Chronicles of England and France," royal 4to, London, 1811). On account of its free animad-
versions on the Catholic clergy, Cardinal Wol-
sey is said to have caused the destruction of a
portion of the first edition, perfect copies of
which are now rare.

FACCIOLASTO, or Facciolatti, Jacopo, an Italian
philologist, born in Torreglia, near Padua, Jan.
4, 1685, died Aug. 26, 1769. Cardinal Bar-
barigo sent him to the ecclesiastical seminary of
Padua, where he took orders and rose to be
professor of philosophy, and finally head of the
institution. He afterward filled the chair of
logic in the university of the same city, and
was charged with continuing the history of
that establishment which Papadopoli had be-
gun. Besides several good editions of the
classics and various works on grammar, ethics,
theology, and some poetry, he published re-
visions of the Lexicon of Schrevelius, the The-
saurus Ciceronianus of Nizolius, and an edition
in seven languages of Capeo's dictionary (2
vols. fol., 1731), in which he received much as-
sistance from his pupil Forcellini and others.
It was after the death of the last named
work that Facciolatto and Forcellini began to
compose the great Latin dictionary published
after the death of both, under their joint names,
but which was almost entirely the work of the
latter. (See Forcellini.)

FACTOR (Lat., from facere, to do or make),
one who conducts business for another. The
word originally had almost the same meaning
as agent (Lat. agent, to act). But while agent
was used to represent every one who acted in
any way in the stead of another, factor became
limited to those who so act in mercantile trans-
actions. Factor is then a mercantile agent,
herein being like a broker; but the difference
between them is principally this: a broker acts
for his principal in reference to mercantile
property which the principal retains in his
hands; while the factor has possession of the
goods sent to him for sale, or takes possession
of those which he buys for his principal. From
this difference others have grown; and the
most important of these is, that the broker
buys and sells as agent, while the factor may
buy and sell in his own name, the person deal-
ing with him not always knowing whether the
factor or some one else owns the goods. In
the United States, among merchants, the phrase
commission merchant has taken the place of
factor, and means much the same thing; but
the word factor is retained as a law term, and
the law of factors is the law of commission
merchants. Besides regular commission mer-
chants, any one intrusted with the possession
of property belonging to another, and author-
ized by the owner to dispose of it, may be a
factor, as a supercargo. So a common carrier
may be a factor; and while he acts as such, he
is responsible only as a factor, that is, only for
injuries or losses caused by want of due care;
but when he has sold goods as factor, and has
received the money which it is his duty to bring
home as carrier, his obligations as carrier re-
 vive, and he is now liable for any loss not
cased by the act of God or the public enemy.
A factor is a general agent, and as such binds
his principal.—The most general duty of a fac-
tor, as of every agent, is to obey the instruc-
tions he receives. But he is considered by the
law merchant as an agent having much discre-
tion, and an equal responsibility; while there-
fore he is bound to obey definite and positive
instructions, he is not bound to pay such regard
to mere intimations or wishes, because he may
well believe that, whatever his principal might
desire or consider expedient, if he did not give
positive directions it was because he preferred
leaving the decision to the discretion of his
factor. And even if he have positive and pre-
cise instructions, his departure from them will
be justified if it was caused by an unforeseen
emergency, and if he acted in good faith, and
certainly for the actual advantage of his prin-
cipal. If, however, a factor buys goods for his
principal and sends them to him in distinct
violation of an order, his principal may reject
the goods, or make the factor answer for them;
or, if the nature of the goods and the circum-
stances of the case render it certainly expedient,
he may sell the goods for his factor, and remit
to him or credit him with the proceeds. A
factor generally acquires no right to his com-
missions until the service by which he is to
earn them is wholly rendered, unless prevented
without his fault from completing his service,
in which case he may have a reasonable com-
ensation. Nor has he any claim for compen-
sation unless he conducts his business with
proper care and skill, and he is liable in dam-
ages for any loss his principal sustains by his
want of care and skill; nor can he claim any
compensation for any illegal or immoral service.
A factor cannot delegate his power and right,
except so far as he is authorized to do so, either
expressly, or by the nature of his usage, or by
the peculiar circumstances of the case. In the
absence of positive instructions, it is the duty
of the factor to obey and conform to the com-
mon usage of that business, and he can, in
general, bind his principal only within that
usage. He has a considerable discretion, but
is bound to use it with reasonable care, and
with perfect good faith. Thus, if he hastens a
sale improperly, and without reasonable cause
or excuse, as, for example, if he hurries a sale,
clearly against the interest of the principal, for
the purpose of realizing at once his own ad-
vances, such a sale would be considered a
fraudulent sacrifice of his principal's property,
and would render him liable in damages. The
factor is bound to insure the property of his
principal when instructed to do so, and also if
a general, well established, and well known
usage requires it of him, and particularly if
there have been antecedent acts or usages be-
tween him and his principal, from which his
principal might reasonably have expected that
he would effect insurance, and therefore omit
doing this himself.—In general, the principal
has the right of revoking the authority he has
given to his factor at any time before the factor has made any advances upon the goods; and may then demand them, paying of course whatever legal claims the factor may have, not for his commissions, but for expenses properly incurred about the goods, and for any special services he has been called upon to render. But it is a question whether, if a commission merchant has made advances upon goods, he has not now acquired an interest in them and an authority over them, which his principal cannot defeat by revocation. The prevailing doctrine in the United States is that a factor by advances upon goods acquires an interest in the goods themselves, and that his authority over them is therefore irrevocable. In England the courts hold otherwise, and a factor who has made advances upon goods is denied the power to sell them or any part of them if positively prohibited by his principal; while in the United States he may sell so much as will cover his advances and charges, the principal having power over only the surplus or residue after the factor's advances are repaid. The factor is not obliged to sell, but after demand and reasonable delay may have his action against his principal for his advances. The question what power a factor has to pledge the goods consigned to him has been much agitated. By placing the goods in his possession, the principal may be said to give to his factor the power of acting as an owner, to the injury of others. It is on this ground that in England and in many of the United States such a factor, whether called commission merchant, consignee, agent, or otherwise, is deemed to be the true owner, so far as to render valid a sale, pledge, or other disposition of the property, while the party with whom he deals acts in good faith. A factor may make a special contract with his principal, to guarantee all sales made for him. In continental Europe, sometimes in England, more rarely here, such a factor may apply the purchaser as his commission. With us he is common, and perhaps universally, said to act under a guarantee commission. The meaning of this is, that in addition to the usual commission (or that agreed upon) for the sale of the goods, he receives a further commission, in consideration of which he guarantees the payment by the purchaser of the price of the goods, and agrees to pay if the purchaser does not. A guarantee commission merchant has the same claim on his principal for his advances as if he made no guarantee. If he takes a note from the purchaser of the goods, this note is the property of his principal, and he guarantees the note; and if he takes payment in depreciated paper, he must make it good. If money be paid, and he remits it in some customary and proper way, or in such way as may be specially directed by the owner, he is not responsible for its safe arrival, unless he undertakes to guarantee the remittance; in which case he may charge a commission for his guarantee. Without any guarantee commission a factor is liable to his principal, not only for his neglect or default, but for certain acts which seem to assume this liability; as if he sells the goods of several principals to one purchaser, on credit, and takes a note payable or indorsed to himself, and gets it discounted. It has already been remarked that a factor may buy, sell, sue and be sued, demand, collect, receive, and receipt for money, all in his own name, and as a principal, while a broker can do all this only in his own name and as an agent. This difference between them springs from the possession of the goods by the factor (for possession is one of the principal matters of ownership) and the non-possession of them by the broker. There is a more important difference between them, founded on the same circumstance; this is, that the factor has a lien on the goods for his advances, charges, and commissions, and a broker has not. But if a factor voluntarily transfers the goods to the owner, or to the owner's order, he cannot reclaim them as his security, but retains only his personal right to demand his advances and charges from the owner. If the owner is insolvent, the factor takes then only his dividend; whereas if he still holds the possession, the other creditors can have the goods only by discharging the factor's claims in full. Therefore the factor and his principal may have claims against a purchaser which may seem to conflict; for the principal may demand his price, while the factor claims his advances and charges. In general, it may be said that if a purchaser pays in good faith to either, without notice of the other's claim, he will be protected against the other. But if the owner demands his price, the purchaser cannot set off against this, or claim to deduct, a general debt to the purchaser from the factor, unless the factor sold the goods as his own, under circumstances which gave him a right so to sell them, and the buyer believed the goods to be his, in which case the buyer may charge against the price, or indeed pay the whole price, by the indebtedness of the factor to him. On the other hand, if the factor has a lien on the goods, and has not lost his lien by parting with the possession of the goods, the buyer cannot set off against this lien any debt due to him from the principal, although the principal be named at the sale as the owner of the goods. An important distinction is made between a foreign factor, or one who transacts business for his principal in a country in which the latter does not reside, and a domestic factor, or one who acts in the same country in which the principal resides. Although every factor may act in his own name, yet in the case of a foreign factor the law goes much further, and considers the factor as in almost all respects a principal. The reasons of this is obvious. A factor at home with a factor whose principal resides abroad, has no means of knowing who the principal is, or what goods are his, or by what title they
are his, or for what purpose they are in the factor's hands, excepting as the factor may choose to tell him. He can have no access, or certainly no easy access, to the foreign principal, for the purpose of remedy or enforcement; and, on the other hand, cannot be presumed to have bought or sold on the credit of a person thus unknown and inaccessible. It is but fair, therefore, that the factor should be, as to the purchaser, the principal; and it is equally fair that the factor should be in such case the only principal. These, however, are but presumptions of law. The factor and purchaser may make what agreement they please, and the law will carry it into effect. In the absence of special agreement, that is, in the case of an ordinary transaction with a foreign factor, the buyer may sue the factor, and cannot sue the principal, although the principal may recover from a buyer a price not yet paid to the factor. The rule that the party dealing with the factor looks to him only, seems to be well settled, if he knew that he was dealing with the factor of a foreign principal, and reserved no right or claim against that principal. Whether he could sue the principal, if he did not know him at the time of the transaction, but discovered him afterward, is not so certain; for there are authorities which limit the rule to the former cases, and in the latter give the party a concurrent remedy against the factor and the principal. It seems now settled that, for the purpose of this distinction, the states of the Union are foreign to each other. It is a general rule that a principal does not lose his property by any wrongful act of his factor, as long as he can trace and identify his goods, either in the factor's hands, or into the hands of any person who holds by representation of or derivation from the factor, without being purchaser, pledge, or otherwise a transferee in good faith and for value. And when a principal finds his property encumbered by an act of the factor, as a pledge, or the like, he may always recover his property by paying the amount of encumbrance. In some of the United States a fraudulent disposition by a factor of the property of his principal is an indictable offence, and is punished with severity.

FAUCUNDUS, a Latin theologian of the 6th century, bishop of Hermia in Byzacium, Africa. With many other bishops, especially those of Africa, he opposed Justianian's decree condemning the "three chapters" (see CONSTANTINOPLE, Concilrets of), and wrote at Constantinople Pro Defensione trium Capitulorum Libri XII. He attended the conference of bishops called by Pope Vigilius there in 547, refused to commune with him for his vacillating course, and after the council of Constantinople (553) was banished. The above work (edited by Sirmond, 1629) and other writings of Facundus were several times printed in the 17th and 18th centuries.

FAULD, John and Thomas. See supplement.

FAENZA (anc. Faesentia), a fortified city of central Italy, in the province and 18 m. S. W. of the city of Ravenna, on the Lamone, at its junction with the canal of Zanelli; pop. in 1871, 86,299. It is the seat of a bishopric, and has a fine cathedral, theatre, several churches and convents which contain valuable paintings, a lunatic asylum, a city hall, several splendid private palaces, a royal lyceum with a picture gallery, a communal gymnasium, and a technical school. The beauty of the city and its suburbs has gained for it the name of the Florence of Romagna. Its formerly celebrated manufactures of a peculiar earthenware, called from this place faience, have declined in importance, and its chief industry at present consists in manufactures of paper, linen, and silk, and in an active commerce in the products of the territory, which are taken by canal from Faenza to the Po. A few miles from the town are ferruginous and saline springs and baths, which are much resorted to. The city was the scene of the defeat of Carbo and Norbannus by Metellus, 89 B.C. It was taken by the Goths in the 6th century, and by the emperor Frederick II. in 1241. Sir John Hawkwood, in the service of Gregory XI., captured it in 1276, and put to death, it is said, about 4,000 persons. It was successively subject to Bologna and Venice, and in 1509 was taken by Pope Julius II.

FIBBOLI. See Fiesole.

FAGNANI, Joseph, an American artist, born in Naples, Italy, Dec. 24, 1819, died in New York, May 22, 1878. He made crayon portraits before completing his 18th year, left the royal academy at 18, and removed to Vienna, where he painted a portrait of the archduke Charles. In 1842 in Paris he met Maria Christina of Spain, who invited him to Madrid. There he secured the friendship of Sir Henry Bulwer, and accompanied him to Washington in 1849. In 1851 he removed to New York, and married an American lady. From 1858 till 1865 he was in Europe, and executed portraits of Garibaldi, Victor Emanuel, the empress Eugenie, Abdul Aziz, Ali Pasha, Cialdini, Rattazzi, and others. After his return to New York he painted a series of pictures called the "Nine Muses." Among his other works are portraits of Queens Christina and Isabella of Spain, the duchess of Alba, the duke d'Aumale, the countess Guiccioli, Lord Byron from a miniature, Sir Robert Peel, Alexis de Tocqueville, John Bright, Richard Cobden, Daniel Webster, Henry Clay, Gen. Taylor, and Gen. Sheridan. He received the only gold medal ever given for a portrait by the royal Bourbonic academy of Naples, and was decorated by a number of European sovereigns.

FAHLCRANTZ, Karl Johan, a Swedish painter, born in Dalecarlia, Nov. 29, 1774, died Jan. 1, 1861. He was the son of a clergyman, and, although self-taught, his delineations of Scandinavian scenery won for him the reputation of the best Swedish landscape painter of his day. His most finished paintings belong to the Swe-
FAULC

FAULC, or Falun (Sw. Falu), the capital of the Swedish län of the same name or Kopparberg, on the W. shore of Lake Runn, 130 m. N. N. W. of Stockholm, pop. in 1880, 5,891. The houses are low and almost entirely of wood. The copper mines W. of this town are among the oldest and most celebrated in Europe. They produced in former times upward of 3,000 tons, but now about 700 tons annually. The external opening, made by the falling in of ancient galleries, is about 800 ft. deep, and 1,200 ft. long by 600 wide. The descent to the bottom of this is by easy stairs, whence steep ladders lead to the pits, the lowest of which are about 1,300 ft. from the surface. The excavations extend many miles under ground, forming several magnificent chambers, where banquets were given to Bernadotte and his queen, and Prince Oscar, on which occasions the mines were brilliantly illuminated. The mines are owned by a company of 1,500 shares, which has the monopoly of iron and other works in the vicinity. Besides copper, small quantities of gold, silver, and lead are obtained from the ore. Connected with the mines are a school of practical mining, a model room, a large scientific library, and a geological museum. (For the län see KOPPARBERG.)

FAHRENHEIT, Gabriel Daniel, a German physicist and mechanician, born in Danzig about 1690, died in Amsterdam, Sept. 18, 1736. His predilection for the natural sciences led him to abandon mercantile life and travel in pursuit of knowledge. After visiting various parts of Germany, France, and England, he settled at Amsterdam as a maker of philosophical instruments. Here some of the most eminent natural philosophers of the day became his friends and instructors. Fahrenheit improved the areometer, and made some progress with the design of a hydraulic machine for the draining of land; but he is chiefly distinguished for the changes which he made in the thermometer, which were first carried out in 1720, and have added much to the accuracy and value of that instrument. (See THERMOMETER.) His thermometer since its first introduction has been in general use in Holland, Great Britain, and the United States. Its constructor was elected a member of the royal society of London in 1724, in whose "Philosophical Transactions" for that year are papers by him.

FAIHERBE, Louis Léon César, a French soldier, born in Lille, June 3, 1818. He studied at Paris and Metz, served in Algeria and Guadeloupe, and became in 1854 governor of Senegal, where he distinguished himself and considerably extended the French possessions. After a brief command in Algeria he was sent against Senegal and the Gold Coast, where he remained as governor till 1865, when he became commander of the military division of Bona in Algeria. After the capture of the citadel of Amiens by the Germans, at the end of November, 1870, he was appointed by Gambetta commander-in-chief of the northern army and of the third military division. With about 50,000 men he took the offensive near Amiens, and after various unfortunate engagements was thoroughly defeated at Beauneville, Jan. 3, 1871, Péronne capitulating Jan. 10, after three weeks' resistance; and he was overwhelmed at St. Quentin, Jan. 19. His forces were completely disorganized and retreated toward Lille, and the northern army was disbanded in March. In June he was elected by Lille to the national assembly, and in 1872 he resigned his commission in the army. He has written Chapitre de géographie sur le nord-ouest de l'Afrique (1864); Collection complète des inscriptions numidiques (1870); and Campagne de l'armée du nord (1871, several times reprinted).

FAILLON, Michel Étienne, a French theological and historical writer, born at Tarascon in 1799, died in Paris, Oct. 25, 1870. He was a Sul-pician of Paris, and came to Montreal in 1854 as visitor of the houses of that congregation in America. His contributions to the history of Canada are numerous and valuable, embracing a life of the Ven. Mr. Olier (1858); of Margaret Bourgeoys, foundress of the congregation sisters (1852); of Mlle. Maure, foundress of the Hôtel Dieu (1854); of Madame d'Youville, foundress of the gray sisters (1882); of Mlle. le Ber, the recluse (1860); and a very extended history of the French colony in Canada, of which 3 vols. 4to (1865-6) appeared before his death, embracing only a small portion of his plan.

FAILLY, Pierre Louis Charles Achille de, a French soldier, born at Rozy-sur-Serre, department of Aisne, about 1810. He went to Algeria as sub-lieutenant in 1828, was afterward orderly officer of King Louis Philippe and director of the military school at Toulouse, became a brigadier general in 1858, and for his services in the Crimean war was made general of division. Sept. 22, 1855. He was aide-de-camp of Napoleon III., commanded a division in the war of 1859, and especially distinguished himself at Solferino. In 1867 he was sent with an expeditionary corps to Rome. On the outbreak of the Franco-German war in 1870 he was placed in command of the fifth corps, with his headquarters at Bisch. After the disastrous battle of Wörth he retired with the remnant of MacMahon's army to Châlons. Co-operating with the forces of the latter during their passage of the Ardenne for the relief of Bazaine at Metz, he was surprised and defeated at Beaumont, Aug. 30. MacMahon was paralyzed, and the capitulation of Sedan terminated the career of Failly. While a prisoner of war he attempted in his Marches et opérations du 5e corps (Brussels, 1871) to refute the charges brought against him.

FAIRE (Lat. feria, a day of rest, a holiday), a gathering for the purchase and sale of goods,
or the hiring of servants, occasionally associated with religious festivals and popular entertainments. The ancient Greeks held fairs in conjunction with popular assemblies for political purposes. The Roman fora, though properly permanent market places, attracted great multitudes at times of festivity and important judicial and political gatherings, and on such occasions the special facilities for selling goods, as well as the special provisions for popular entertainment, must have given them somewhat of the character of fairs. In the 6th century fairs were established in several French and Italian cities. The fair of St. Denis was instituted by Dagobert in 639, and the fair of St. Lazare by Louis VI. Aix-la-Chapelle and Troyes trace their fairs to about the year 800. Alfred the Great introduced them into England in 886, and in 960 they were established in Flanders. Fairs for the sale of slaves were common throughout Germany and the north of Europe about the year 1000; and in 1071 they were encouraged in England by William the Conqueror. Slaves were sold also at St. Denis, and French children were taken in return to be bartered away in foreign countries; this trade was prohibited through the efforts of Bathilda, a wealthy freedwoman. These institutions were of great value during the middle ages, and especially serviceable in rude and inland countries. The number of shops and the objects offered for sale in them were very limited, and consequently little frequented by dealers. These fairs had numerous privileges annexed to them, and they afforded special facilities for the disposal of goods. While commerce was burdened with every possible kind of taxes and tolls, and travel was not only difficult but frequently unsafe, the fairs had generally the advantage of being free from imposts, and the merchants who wished to be present at them enjoyed the protection of the government for their goods and persons. Many fairs were associated with religious festivals, perhaps to insure a large concourse of people. In many places they are still held on the same day with the vigil or feast of the saint to whom the principal church of the town is dedicated. It was even customary in England and Germany to hold the fairs in the churches and churchyards. Fairs for cattle, agricultural products, and staple manufactures have been found entirely unnecessary in countries enjoying a free and flourishing trade, and they dwindle accordingly into insignificance. On the other hand, fairs offer special opportunities for comparing different qualities of home manufactures and produce, and thus are valuable as a means of instruction. Another advantage attached to them is that they bring communities which are but slowly reached by the progress of civilization into regular contact with each other. The ancient fairs of large cities in former times accordingly manifest the greatest decrease of attendance, while the genuine country fairs still retain much of their importance.—To the priory of

St. Bartholomew in London, founded early in the 12th century, Henry I. granted in 1138 the privilege of holding a fair on St. Bartholomew's day. The original grant was for three days, but it was gradually extended to fifteen. An order of the common council in 1708 limited its duration again to three days. It was at first a great place of resort for traders and pleasure seekers, but it declined in importance until it was only attended by itinerant showmen and the owners of a few stalls. In 1850 the lord mayor made proclamation of the fair for the last time, and it has not been held since 1855. (See Morley's "Memoirs of Bartholomew's Fair," London, 1859.) Weyhill fair in Hampshire (Oct. 10) has probably the greatest display of sheep of any fair in Great Britain. St. Faith's, near Norwich (Oct. 17), is the principal English fair for Scotch cattle, but large numbers are also disposed of at Market Harborough, Carlisle, and Ormskirk. Ipswich has two considerable fairs, one in August for lambs, of which about 100,000 are sold, and one in September for butter and cheese. The August fair of Horncastle, Lincolnshire, is the largest horse fair, and is resorted to by dealers not only from Great Britain, but also from the continent and the United States. Howden in Yorkshire has also a large horse fair, particularly for Yorkshire hunters. Suffolk horses are exhibited at the celebrated Woodbridge Lady-day fair. Bristol, Exeter, and many other English cities, towns, and hamlets, have their fairs. A great cheese fair is held in April at Gloucester. Fairs were held at Greenwich at Easter and Whit-suicide, which attracted large crowds of visitors from London to partake in the many amusements, as well as to enjoy the fresh air and the fine scenery from the park and its neighborhood; but Greenwich fair was suppressed in 1857 by the police, the inhabitants having complained of it as a nuisance. Walworth, Cambuswall, and Peckham fairs have also been suppressed. The most important mart in Scotland for cattle and sheep is Falkirk fair or tryst. The largest fair in Ireland for the sale of cattle and sheep is held from Oct. 5 to 9 at Ballinasloe, in the counties of Galway and Roscommon. About 25,000 head of cattle and 75,000 sheep, most of which are raised in Connacht, are annually brought to this fair. Donnybrook fair, celebrated for its noisy mirth and pugnacity, is now abolished. In France the St. Denis fair, near Paris, both commercial and religious, was continued till 1789. It was customary to exhibit there a piece of wood alleged to have belonged to the cross on which Jesus was crucified, and the whole of Paris went to see it. The St. Lazare, St. Laurent, St. Germain, and St. Ovid fairs in Paris were also suppressed in 1789. Permanent markets have taken their place as far as the sale of goods is concerned, and the popular shows and entertainments that used to attend them are now confined to the celebration of national holidays and church festivals. In
the departments a few fairs are still in existence and enjoy a good trade. The most important is the fair of Beaucaire, which is held July 29–30, and rivals the great fairs of Germany and Russia. The counts of Toulouse granted this fair some privileges in the 13th century, and Charles VIII. decreed its time and duration. In the very heart of the town an extensive square is appropriated for it, and while it lasts thousands of stalls are erected on it, in which is offered for sale everything that forms an article of commerce. It is believed that often as many as 200,000 traders from all parts of the world assemble here. After dark the whole town is given up to gayety, and the numerous show and concert and dancing saloons turn it into a pandemonium. A tribunal of commerce, consisting of 12 members, exercises during this season absolute judicial power over all mercantile differences. It is estimated that the trade of the week of the fair amounts to $4,000,000 or $5,000,000. Equally large are the transactions made at the fair of Guivry, a small suburb of the town of Falaise, held from Aug. 10 to 15. It was instituted in the 11th century by the dukes of Normandy, and is the principal market for wool and woollen goods, and for valuable horses.—The annual fairs in Amsterdam, Rotterdam, and other cities in Holland, are scenes of great popular rejoicings. For several days and nights the streets are paraded by joyous crowds, and the usual sobriety of the Dutch yields to boisterous demonstrations. Theatres and shows of all kinds form the staple amusements, and among the refreshments are wafer cakes, a sort of thin cake baked in an iron mould, of which the consumption is enormous.—The principal fair of Italy is that of St. Mary Magdalene in Sinigaglia, which is annually held in July and August, and attended by traders from all parts of central and northern Europe, north Africa, and the Levant. Among the various products of Italian industry which change hands here, silk is the most important. Fairs of less consequence are held in other parts of Italy, as well as in Spain and Portugal. The most famous fair of Madrid is annually held on May 15, at the hermitage of San Isidro del Campo, when the grand pilgrimage and festival of San Isidro draws thither crowds of the population. The great Hungarian fairs are held chiefly at Pesth. Four times a year, in March, May, August, and November, the industrial products of Hungary are brought here for sale. Scarcely less important for the commerce of eastern Europe, and more interesting for the traveller and observer of national customs, are the fairs of Debreczin.—The fairs of the greatest European importance, however, are those of Germany. The most famous of these are those of Nuremberg, Ratisbon, Ulm, Munich, Hanover, getting fair in Hanover, Freiberg, Chemnitz, Leipzig, Berlin, Hanover, and in the great fairs of France and the Low Countries, through religious festivals. Hence fairs were called Kirchmessen, church fairs, the German word Messe (fair) being derived from mass. The most prominent fairs are those of Leipzig, Frankfort-on-the-Main, Frankfort-on-the-Oder, and Brunswick. The Leipzig fairs date from the 12th century, and are the most frequented. Of the aggregate value of goods sold at German fairs Leipzig has 48 per cent, Frankfort-on-the-Oder 8%, Frankfort-on-the-Main 15, and Brunswick 5. Leipzig holds three fairs: the Easter fair, beginning on the second Sunday after Easter, the Michaelmas fair, beginning with the week of Michaelmas; and the New Year's fair, beginning on Dec. 27. The Easter fair is the most important, and the New Year's fair the least. The imports of goods in 1870 for New Year's amounted to 187,330 cwt.; for Easter to 818,800 cwt.; for Michaelmas to 396,870 cwt.; total, 798,100 cwt. The principal articles of trade carried to the fairs are furs, yarn, silk, cloth, cotton goods, ribbons, hardware, toys, china, glass, and earthenware, drugs, grain, hides, leather, dye stuffs, colors, oils, alcohol, coal, and paper. Easter is the customary season among booksellers for settling their accounts, and for the principal trade sale, but the exhibition of books formerly connected with this fair has gone into disuse.—The most celebrated fairs of Russia are held in Nizhni-Novgorod. The January fair is specially for timber and articles in wood, and takes place on the frozen river; the July fair is devoted to the sale of horses; but the Peter Paul fair, beginning Aug. 5 and lasting until the end of September, embraces every known product of Asia and Europe, and exceeds in magnitude all other fairs in the world. The traders present during this season often number 200,000, and comprise representatives of every race and nation. The principal articles of trade are tea, grain, cotton, wool, horse and camel hair, hides, iron, copper, jewels, and furs; but every kind of manufacturing and agricultural produce is brought to this market. The sales amount to nearly $100,000,000. The Russian government erected a bazaar for storing furs, shawls, and tea, and drew from each fair a rent of $200,000. This enormous building was destroyed by fire in 1864. The fair of Kiskhata on the Russian-Chinese frontier, held every December since 1727, and formerly of great magnitude, as it was the only legal trading post between the two countries, has dwindled to comparative insignificance since the opening for traffic in 1860 of the whole frontier, and the decree of 1861 permitting the importation of tea from the countries W. of Russia, and the ports on the Baltic sea.—The chief fairs of Turkey are those of Yemenje Var- dar and Sera, the former commencing on Dec. 8 and continuing for about three weeks, and the latter on March 21, for three or four weeks; of Ohrhida (May 3), Varna (May 29), Filibe (Aug. 27), and Eski Saghra (Nov. 10), each of which lasts a fortnight; and those of Yatar Bazari (Sept. 15) and Tschaltadeh (Nov. 6), which last 10 days. Conspicuous among the various traders assembled there are the Greeks and Armenians. But the greatest fair in the East is held at Mecca during the
time of the annual pilgrimages. Although it has declined from its ancient magnitude, the attendance extends still amounts to 100,000... The largest fair in India is held at the vernal equinox at Hardwar, on the upper Ganges. It is the season of the yearly pilgrimage, and from 200,000 to 300,000 strangers are then assembled in the town; every 12th year, which is accounted peculiarly holy, nearly 2,000,000 pilgrims and dealers visit the place. This fair is supplied with every article of home produce, and not only elephants but tigers and other wild beasts are offered for sale. Preceding to the British occupation, the fairs usually ended in bloodshed; but owing to the precautions adopted, perfect order is now preserved.—According to Prescott's "History of the Conquest of Mexico," fairs were held in the principal cities of ancient Mexico every fifth day (there having been no shape), and were thronged. "A particular quarter was allotted to each kind of article. The transactions were conducted under the inspection of magistrates appointed for the purpose. The traffic was carried on partly by barter, and partly by means of a regulated currency of different values. This consisted of transparent quills of gold dust; of bits of tin, cut in the form of a T; and of bags of cacao, containing a specific number of grains." Fairs were regularly held at Azcapotzalco, not far from the capital, for the sale of slaves. The gatherings in the market of Tlacapoca were a sort of fairs, where pottery which was considered equal to the best in Europe formed one of the principal articles of trade, and every description of domestic produce and manufacture was brought there for sale. But the greatest fair was held in the city of Mexico. The visitors there were estimated at from 40,000 to 50,000, but the most perfect order reigned throughout. A court of 12 judges sat in one part of the tiangues, clothed with absolute power, which they exercised with great rigor. In Prescott's "History of Conquest of Peru" it is said that the incas instituted fairs for the facilitation of agricultural exchanges. They took place three times a month in some of the most populous places, where, as money was unknown, a rude kind of commerce was carried on by barter.—The only fairs in the United States, properly so called, are assemblages for the sale and purchase of goods, generally contributed gratuitously, for the benefit of some particular object, as the building or furnishing of a church, or the promotion of some charitable enterprise. During the civil war very large sums were raised by the so-called sanitary fairs, for the benefit of the sick and wounded.—The word fair is also applied to exhibitions of articles not specially intended for sale, and sometimes strictly prohibited from sale at the place of exhibition. The state and county fairs in the United States are for competitive exhibition rather than general traffic. (See Industrial Exhibitions.)

FAIRBAIN, Sir William, a British civil engineer and machinist, born in Kelso, Feb. 19, 1769, died in Manchester, Aug. 18, 1874. He learned engineering at a colliery in Newcastle, where he remained seven years. In 1817 he began business in Manchester as a machine maker, and for upward of 20 years his firm was the most important of the kind in that town. Among the improvements he introduced may be mentioned simpler contrivances for driving the machinery of factories, modifications in the valves of steam engines, the double-fired boiler, the use of ventilated buckets in water wheels, and the invention of the riveting machine. In 1830-31, his attention having been drawn to the advantages of iron as a material for building ships, he constructed a small iron vessel, which was successfully launched, and was one of the first of its class in England. He afterward constructed at Millwall many large vessels of the same material. He was also one of the first to attempt buildings of iron. His experience in manufacture caused him to be consulted with regard to the construction of the tubular bridge over the Menai strait; and in connection with Mr. Hodgkinson he engaged in a number of experiments, the result of which has been to introduce in general use wrought-iron plate girders in ordinary building operations, as well as in railway engineering. He delivered lectures in 1858 on the "Resistance of Tubes to Collapse," on the "Floating Corn Mill for the Navy," on the "Progress of Mechanical Science," &c. He published "Cast and Wrought Iron for Building Purposes" (London, 1852; New York, 1854); "Useful Information for Engineers" (1856); "Iron, its History and Manufacture" (Edinburgh, 1863); "Mills and Mill Work" (2 vols., London, 1864-65); and "Iron Ship Building" (1868). He was made a baronet in 1869.—See Smiles's "Lives of Engineers."

FAIRFAX, a N. E. county of Virginia, separated from Maryland and the District of Columbia by the Potomac river; area, 430 sq. m.; pop. in 1870, 12,962, of whom 4,284 were colored. The Occoquan river touches it on the S. W. The Orange, Alexandria, and Manassas, and the Washington and Ohio railroads pass through it. On the bank of the Potomac, in this county, and 16 m. below Washington city, stands Mount Vernon, the residence of George Washington. The surface is generally hilly. The soil in some places is sandy, and in others is nearly worn out; but there are many fertile and well cultivated districts. The chief productions in 1870 were 59,982 bushels of wheat, 285,330 of Indian corn, 120,073 of oats, 73,337 of potatoes, 8,897 tons of hay, and 176,345 lbs. of butter. There were 2,811 horses, 3,907 milch cows, 3,825 other cattle, 2,414 sheep, and 7,152 swine; 4 flour and 6 saw mills, 12 manufactories of carriage and wagons, 2 of bricks. Capital, Fairfax Court House.
FAIRFAX, Edward, an English poet, born at Denton, Yorkshire, died in the parish of Fay-stone about 1693. The translation of Tasso's "Jerusalem Delivered," by which alone his name is remembered, was made in his youth, and dedicated to Queen Elizabeth, and was long enthusiastically admired. The first edition was dated 1600. Its popularity has revived in the present century, and several editions have appeared in England and the United States. The last American edition was in 1855. He also wrote a few eclogues, a prose work on demonology, and a "History of Edward the Black Prince," the manuscript of which was destroyed by fire at Whitehall.

FAIRFAX, Thomas, third Baron Fairfax of Cameron, in the Scotch peerage, grand-nephew of the preceding, a parliamentary general in the civil wars of Charles I., born at Denton, Yorkshire, in January, 1611, died at Bilburgh, near York, Nov. 12, 1671. He studied at St. John's college, Cambridge, served as a volunteer in Holland, under the command of Lord Vere, whose daughter he afterward married, returned to England in 1634 or 1635, and lived in retirement till the breaking out of the war in 1642. When the king set about raising a guard for his person at York, Fairfax presented himself at the head of a multitude of 100,000, praying that he would return and hearken to his parliament. The first hostilities occurring in Yorkshire, Fairfax's father, Ferdinando, second Lord Fairfax, was made general of the parliamentary forces in the north, with himself (then Sir Thomas Fairfax) as his general of the horse. They were denounced as traitors by the earl of Newcastle, the royal commander in those parts, who in turn was proclaimed a traitor by the parliament. The Fairfax were defeated in several encounters, and completely routed in an attack upon the royalist forces under the earl of Newcastle at Atherton Moor. The first parliamentary successes of 1644 was that of Nantwich, in Cheshire, where Sir Thomas Fairfax defeated Byron with great loss, and Monk, the future restaurer of the monarchy, was taken prisoner. Fairfax then joined the Scotch army, which to the number of 20,000, under the command of Lord Leven, had crossed the Tyne, and united with the earl of Manchester's army, in which Cromwell was major general. At Marston Moor, near York, on July 2, Fairfax gained a temporary success; but the victory was decided only by the steady valor of the republican forces under Cromwell. York was immediately forced to surrender, and Sir Thomas quickly reduced the remaining royalist fortresses north of the Trent, and after the passage of the self-denying ordinance in 1646 received from parliament the appointment of lieutenant general. On April 3 he departed for Windsor, where, with the assistance of Cromwell, who was his lieutenant, he set about remodelling the army. On June 14 the hostile forces met at Naseby, where Fairfax and Cromwell pierced the royalist ranks in all directions. The personal valor of Fairfax was especially signalized in this battle. He was constantly in the thickest of the fight, and rode about bareheaded after his helmet was beaten to pieces. He now quickly recovered Leicester, Langport, Bridgewater, and Bath. Bristol soon surrendered, and the speedy reduction of the kingdom followed, Fairfax and Cromwell having to this end divided their forces. In the politics of the dominant party Fairfax had now to play the difficult part of a sincere advocate of monarchical power. He seems to have been led on by Cromwell, and to have been the instrument of projects whose depth he could not fathom. In 1648 he annihilated the last remains of the royalist party at Colchester. His own influence declined as that of Cromwell and the Independents increased; and though his loyal instincts recoiled from the judicial trial of the king, he was unable to prevent it. He accepted the command of all the forces of England and Ireland under the new government, put down the Levellers in Oxfordshire, and composed the troubles in Hampshire. When in 1650 the Scots declared for Charles II., he refused to march against them, and laid down his commission. When Monk entered England, Fairfax took possession of York, Jan. 1, 1660. He gave his consent to the restoration of the monarchy, and presented to King Charles the horse on which he rode to his coronation, after which he went into retirement. Lord Fairfax was a friend of learning, and in his youth devoted much attention to antiquarian studies. During the siege of York, when a tower containing many ancient documents was blown up, he rewarded the soldiers for bringing him as many as could be found, and employed Roger Dodsworth to copy them; they now make a part of the Monasticon Anglicanum. When he took possession of Oxford, June 24, 1646, he set a guard over the Bodleian library, which otherwise might have been destroyed. He wrote a narrative of his career from the commencement of the war, not intended for the public eye, but which was published in 1699 under the title of "Short Memorials of Thomas, Lord Fairfax."—See "The Fairfax Correspondence," edited from the family manuscripts by Robert Bell (4 vols., London, 1840); and "Life of the Great Lord Fairfax," by C. R. Markham (1870).

FAIRFAX, Thomas, sixth Baron Fairfax of Cameron, a British nobleman, born about 1690, died at Greenway Court, near Winchester, Va., in 1782. He was educated at Oxford, enjoyed a reputation as a wit and man of letters, and contributed some papers to the "Spectator." He visited Virginia in 1739 to look after the large estates he had inherited from his mother. He was related to Governor Dinwiddie, governor of the province between 1680 and 1688. They comprised upward of 5,700,000 acres lying between the Potomac and Rappahannock rivers, on both sides of the
FAIRFIELD

Blue Ridge, including a great portion of the Shenandoah valley. He resided afterward at Belvoir, near Mount Vernon, on the Potomac. In 1748 he made the acquaintance of George Washington, then a youth of 16, and, impressed with his energy and talents, employed him to survey his lands lying west of the Blue Ridge. This was the commencement of an intimacy between Fairfax and Washington, which survived all differences of opinion on political subjects, and terminated only with the death of the former. So favorable was the report of Washington, that his employer soon after took up his residence at Greenway Court, in the midst of a manor of 10,000 acres, about 12 miles from Winchester, where during the remainder of his life he lived in a state of baronial hospitality. During the panic on the Virginian frontier after the defeat of Braddock, Fairfax organized a troop of horse, and, as lord lieutenant of Frederick county, called out the local militia. During the disputed by the American war he adhered to the royal cause. The surrender at Yorktown deeply wounded his national pride, and, according to tradition, was the immediate cause of his death, which happened soon after. The generosity of Lord Fairfax is exemplified in the surrender of his large estates in England to his brother, and in his frequent gifts of lands to his poor neighbors in Virginia. The title is still vested in his descendants, the present and 11th baron (1874) being John Coutée Fairfax, M. D., of Bladensburg, Md.

FAIRFIELD. I. A S. W. county of Connecticut, bordering on Long Island sound and the state of New York, and bounded N. E. by the Housatonic river; area, 647 sq. m.; pop. in 1870, 99,276. It has excellent harbors along the coast, and contains several important commercial ports. The Housatonic is navigable by steamboats, and supplies valuable water power. The surface of the county is considerably diversified, and the soil is good. It is traversed by numerous railroads connecting with New York, New Haven, Albany, &c. The chief productions in 1870 were 18,515 bushels of wheat, 26,457 of rye, 285,688 of Indian corn, 172,482 of oats, 518,128 of potatoes, 78,920 tons of hay, 880,261 lbs. of butter, and 190,047 of tobacco. There were 5,655 horses, 14,314 milk cows, 15,263 other cattle, 6,082 sheep, and 8,200 swine. There were 754 manufacturing establishments, with an aggregate capital of $12,145,097. The most important were 2 of ammunition, 12 of boots and shoes, 7 of buttons, 24 of carriages and wagons, 92 of clothing, 3 of cotton goods, 8 of drugs and chemicals, 1 of small arms, 7 of furniture, 4 of gas, 14 of hardware, 6 of hat materials, 27 of hats and caps, 1 of rubber goods, 2 of patent and enameled leather, 4 of engines and boilers, 5 of tombstones, 18 of saddlery and harness, 7 of sashes, doors, and blinds, 1 of sewing-machine fixtures, 3 of sewing machines, 1 of steel, 3 of steel springs, 1 of straw goods, 29 of tin, copper, and sheet-iron ware, 1 of wire work, 9 of woollen goods, 1 planing mill, 23 flour mills, 1 rice warehouse, and 4 boat founderies. Capitals, Bridgeport and Danbury. II. A N. central county of South Carolina, bounded S. W. by Broad river, and N. E. by the Wateree; area, 680 sq. m.; pop. in 1870, 19,888, of whom 14,101 were colored. It has an uneven surface and a fertile soil. It is traversed by the Charleston, Columbia, and Augusta, the Spartanburg and Union, and the Greenfield and Columbia railroads. The chief productions in 1870 were 28,005 bushels of wheat, 218,054 of Indian corn, 16,569 of oats, and 14,024 bales of cotton. There were 1,142 horses, 2,556 mules and asses, 2,891 milch cows, 3,909 other cattle, and 6,044 swine. Capital, Winnsboro. III. A central county of Ohio, with a surface diversified by hills, plains, and rolling lands, and a soil of great fertility; area, 490 sq. m.; pop. in 1870, 91,198. It is intersected by the Ohio and Scioto rivers, and the canals, and the Cincinnati and Muskingum Valley and the Hocking Valley railroads; and is drained by the head stream of Hocking river, and by several small creeks. Limestone and freestone are abundant. The chief productions in 1870 were 553,924 bushels of wheat, 1,706,216 of Indian corn, 24,388 of oats, 24,481 of barley, 116,281 of potatoes, 25,107 tons of hay, 608,548 lbs. of butter, and 175,200 of wool. There were 8,728 horses, 7,996 milch cows, 13,204 other cattle, 40,138 sheep, and 85,995 swine; 4 manufactories of agricultural implements, 12 of carriages and wagons, 9 of clothing, 4 of iron castings, 12 of saddlery and harness, 4 of woollen goods, 2 planing and 9 saw mills, 8 tanneries, 8 currying establishments, 4 breweries, and 13 flour mills. Capital, Lancaster. FAIRFIELD, a town, port of entry, and formerly capital of Fairfield co., Connecticut, on Long Island sound, and on the New York and New Haven railroad, 20 m. W. S. W. of New Haven; pop. in 1870, 5,645. The village is half a mile from the sound, principally on one broad street, and in the vicinity is a spacious hotel for summer visitors. The village of Greenfield Hill, in which Dr. Timothy Dwight resided, is in this town. About 1½ m. E. of Fairfield village is Black Rock, one of the finest harbors in Connecticut, accessible for large vessels at all times of the tide. About 2 m. W. of Fairfield, at the mouth of Mile river, is the village of Southport, the principal business centre of the town. The value of the foreign commerce for the year ending June 30, 1873, was $25,410. There were registered, enrolled, and licensed 184 vessels of 11,607 tons, of which 175 of 8,918 tons were sailing vessels, 7 steamers, and 2 barges; built during the year, 19 vessels of 210 tons. The town contains 2 carriage factories, a harness factory, a national bank, a savings institution, an insurance agency, 16 public schools, and 7 churches. Fairfield was settled in 1683, and incorporated in 1618. In 1779 it was burned by the British
under Gov. Tryon. Since the census of 1870
a portion containing about 1,900 inhabitants
has been annexed to Bridgeport.

FAIRIES, supernatural beings, generally hu-
man in appearance, but endowed with super-
human power, who have played an important
part in the popular superstition of nearly all
nations, and are still believed to exist by the
common people of many countries. The origin
of the word is obscure, but it is probably related
to the Latin *fata* (pl. of *fatum*), which is the
Italian (sing.) for fairy. The difference between
a fairy and a god or goddess of ancient Greece
and other polytheistic lands is very small in re-
gard to the superhuman power which they are
believed to possess; but fairies are never objects
of worship, or of religious sentiment and cere-
mony, though occasionally invoked for aid, or
propitiated. Fairies are believed to suffer death
after a more or less extended period. They are
either benevolent or malicious, and accord-
ingly either the protectors or persecutors of
human beings. Some seem to have no other
purposes than that of enticing young mortals
into their habitations, and treating them for a
season to all manner of sensual pleasure. Their
nature varies, however, with every nation.—
The spirits of the Hindoo Vedas are the general
helpers of favorite individuals; they assist in
love intrigues, remove bodily infirmities, supply
riches, succor in danger, and ride in chariots of
gold. But numerous similar beings are spoken
of in the Vedas, and it may be that the adityas,
also commonly mentioned with the epithet *au-
ra*, belong to the same class. The peris of the
Persian legends are delicate creatures of won-
derous beauty, and either male or female. They
protect mortals against the power of the devas,
who strive to drag them into sin and eternal
destruction. Though not immortal, they en-
joy great longevity; and though possessed of
superhuman power, they are quite human in
sentiment and passion. The Arabs believe in
jinnas, the spirits of the Persian peris, and
fight against the devas. They are said to
have lived on earth several thousand years
before Adam, and a tradition from the prop-
}
is enjoyed by the duendes and tragos, who resemble the house spirits.—The draca of southern France assume the human form, reside in the caverns of rivers, and entice bathing women and boys. The follets inhabit the houses of simple country people, and are invisible, though their voices are heard; their chief employment seems to be pelting people with stones and household utensils. There are also accounts of spirits who suddenly enter a house, ransack and upset everything, and torment those who are sleeping in it. The fadas were fairy ladies who became the spouses of men, and lived with them in great felicity; but when a husband discovered the secret of their nature, or became unfaithful, he either died instantly or led a wretched life for the remainder of his days. The fées, lutins, or gobelins of the north of France are similar to the kobolds and nixes of other nations. The fées are small and handsome, dance in circles or fairy rings by night, haunt solitary springs and groves, mount and gallop strange horses, sitting upon the neck and tying together locks of the mane to form stirrups, always bring luck by their presence, and, like the fairies of most countries, were believed to preside at births, to love young children, to give them presents, and to steal them away, leaving instead their own fairy offspring, which were called change-lings, and were unusually beautiful in countenance but evil in propensities. In the 12th and 13th centuries the forest of Brezélande, near Quentin in Brittany, was thought to contain the tomb of Merlin, and to be a chief seat of the fairies. The white ladies were Norman fairies, and often malignant. They were supposed to be attached to certain great families, in whose affairs they interfered, sometimes for good, sometimes for evil. The white lady of Avenel in Scott's romance of "The Monastery" is an instance of this kind. The lutins or goblins were playful and malicious, elves, pinching children and maidens, twisting their hair into inexplicable knots when they were asleep, and delighting to perplex peasants and to bring them into difficulty. One of the chief articles of accusation against the maid of Orleans was that she resorted to a fountain of the fairies to see her visions; and in Brittany there are fountains still regarded by the natives as sacred to the fairies, and believed to sometimes change into gold or diamond the hand that is inserted into them.—The Eddas of the Scandinavians tell of ahi that are either whiter than the sun and live on earth, or blacker than pitch, and live under ground; and of dvergar, who are diminutive beings dwelling in rocks and hills, and skilful workmen in gold, silver, and iron. The ahi live still in the imagination of the peasantry of Scandinavia, and are distinguished by certain characteristics. The white ahi are the good elves, who dwell in the air, dance on the grass, and have when they show themselves a handsome human form. The black ahi are the evil elves, who frequently inflict injury on mankind. The elves are believed to have wings, and to celebrate weddings and enjoy banqueting, and singing. The Norwegians call the elves heldefolk, and their music heldeflaat. There is also a tune called the elf-king's tune, which is well known, but not sung or played; for as soon as it begins both old and young, and even inanimate objects, are impelled to dance, and the player cannot stop unless he manages to play the tune backward. The Danes call the elves elfolke, and believe that they live in elle moors. An elf man is an old man with a low-crowned hat. The elf woman is young and fair in front, but behind she is hollow like a dough trough; and she has an instrument which when she plays on it ravishes the hearts of young men. The more usual appellation of the dwarfs is troll or trolle, and they are represented as living either in single families or in large communities inside of hills and mounds. Their character seems to have gradually sunk down to the level of the peasantry. They are regarded as rich, obliging, and neighborly, but they have a sad propensity for stealing. The nixes are domestic fairies of Norway, and are fond of frolicking by moonlight and of driving in sledges in the winter. Every church had its niss, who was then called a kirkegrim; it looked after propriety of manners and punished misconduct. The rivers and lakes are inhabited by necks, stromkari, and other beings similar to mermen and mermaids. They are wonderful musicians, and when they play on their harps all nature has to dance.—The Germans believed in dwarfs and elves, wild women, kobolds, and nixes or water sprites. The dwarfs were also known as the still people and the little people, and had their abodes underground and in the clefts of mountains. They visited the surface of the earth only by night, and could render themselves invisible and pass through rocks and walls. They were generally benevolent. The beings called "little wights" inhabited southern Germany. They are only a few inches in stature, and look like old men with long beards, dressed like miners, with lanterns and tools. They announce a death in a family by knocking three times. The wild women are beautiful, and live in the mountain Wunderberg, on the moor near Salzburg. Kobolds assist in the household, and love to play tricks on the servants. The miner's kobold reveals valuable veins and protects the virtuous. The nixes inhabit lakes and rivers; the male is like a man, old and long-bearded, has green teeth, and always wears a green hat; the female appears sometimes as a beautiful maiden, but often in a body terminating in the form of a fish or of a horse. They have magnificent dwellings under the water. The white ahi are noted for their handsome mortals. They comb their golden locks on sunny days, sitting on rocks and trees.—In Ireland and Scotland fairies were believed to shoot at cattle with arrows
headed with flint, and thus to bewitch them; these small arrowheads are known to the country people and antiquaries as elf arrows. The elf fire was the _ignis fatuus_, and other luminous points on moors and heaths were called fairy sparks. A mole or defect on a person was a fairy nip or an elfish mark, and a matted lock of hair in the neck an elf lock. The Gaelic fairies are very handsome, are usually attired in green, and dance, lend and borrow, and make shoes very rapidly. The Gaels call them _daisin shi_ or men of peace, and their habitats _siians_ or _tomhaire_, which are like turrets, and consist of masses of stone. Some mortals have been among them, and after banqueting with them they fell asleep and awoke after a hundred years. The brownie and kelpie of the Highlands seek to decoy unwary people to ride on them when they appear in the form of horses, and plunge with them into the neighboring loch or river.—The fairies of England correspond with those of the Scandinavian and Germans, but the fairies of the English people are somewhat different from those of the poets. The popular fairies were either rural elves, inhabiting woods, fields, mountains, and caverns; or house spirits, usually called hobgoblins or Robin Goodfellow. The fairies of the “Faerie Queen” of Spenser and those of the “Midsummer Night’s Dream” are not the same. The former are stately beings, typical of the moral virtues, with traits borrowed from the Italian fairy mythology, dwelling in enchanted castles, surrounded by courts of knights and ladies, and ruling over extensive kingdoms. Shakespeare adopted the elves and pixies of popular superstition, with their diminutive stature, fondness for dancing, love of cleanliness, and child-stealing propensities, formed them into a community ruled over by Oberon and Titania or Queen Mab, and gave immortality to “that merry wanderer of the night.” Fawn, alias Robin Goodfellow. The “Mad Franks and Merry Jests of Robin Good fellow” (printed by the Percy society, 1841) was originally published in the age of Shakespeare, and furnishes the first records of this mischievous son of a fairy, who “from haggled Merlin’s time” had been famous for his pranks. Corresponding to him are the Rúbezah or Number Nip of German fairy lore, the Cluricaune of Ireland, the Enlispiegel of Germany, and the Howleglass or Owlespiegle of Scotland.—The North American Indians have many quaint fairy legends, which have been collected and narrated by Schoolcraft; and it appears from Mitford’s “Tales of Old Japan” that the Japanese have numerous books of fairy stories, in which the fox plays an important part. These stories are mostly for children.—The earliest collection of European fairy stories in a fairy the Italian _Novelle Gravate_ of Straparola (Venice, 1550). The best Italian collection is the _Pentamerone_ of Giambattista Basile (Naples, 1687); translated from the Neapolitan by W. E. Taylor, London, 1856; it is full of learned allusions and keen satire, and designed for the amusement only of grown persons. Near the end of the 17th century the _Contes des fées_ of Perrault and Madame d’Aulnoy, and their successors, gave vogue to fairy stories throughout Europe, written chiefly for the instruction and amusement of children. The “Arabian Nights’ Entertainments,” introduced into Europe by Galland about the beginning of the 18th century, contributed much to their popularity, and was quickly followed by various imitations of the Arabian, Persian, Turkish, and Mongol tales. The “Tales of the Genii” by James Ridley, the _Fables et contes indiens_ of Langlé, and the later _Contes chinois_ of Bémusat, are examples. The best later imitations are some of the tales of Tieck, Musaux, and Novalis, and especially of La Motte Fouqué, and the romance of the caliph “Vathek,” by Beckford. Hans Christian Andersen’s fairy tales hold a high rank in this species of literature.—The best works on the subject are Keightley’s “Fairy Mythology” (enlarged ed., 1850); Scott’s “Essay on the Fairy Superstition,” in the “Minstrelsy of the Scottish Border;” Croker’s “Fairy Legends and Traditions of the South of Ireland” (1825); Dalyell’s “Darken Superstitions of Scotland” (1888); “Russian Popular Tales,” translated from the German of Dietrich, with an introduction by Grimm (London, 1887); Dessen’s “Popular Tales from the Norse” (1890); Strahlheim’s _Sagen schatz aller Völker der alten Welt_ (Frankfort, 1882); Braun’s _Natursgeschichte der Sage_ (2 vols., Munich, 1864–5); and Kremer’s _Ueber die südostasiatische Sage_ (Leipsic, 1886). 

FAIR OAKS, Battle of. See CHICKAHOMINY.

FAITHFUL, Emily. See supplement.

FAITH TORN. L. WILLIAM, an English engraver, born in London about 1625, died there in May, 1691. He was a pupil of Sir Robert Peakes, served under him in various capacities, and was captured at Basinghouse and confined in Aldersgate. He was at length released and went to France, where he received instruction from Robert Nanteuil. In 1650 he was permitted to return, and set up a shop near Temple Bar, where he did a large business in Italian, Dutch, and English prints, and also continued his professional work. He is most famous for his portraits, of which he produced a large number, including Cromwell, Prince Rupert, Milton, Sir Thomas Fairfax, Thomas Hobbes, and Robert Boyle. In 1662 he published a treatise on engraving and etching. L. WILLIAM, son of the preceding, born in 1656, died in 1686. Like his father, his best works were portraits; but he confined himself mainly to the mezzotint process. He became dissipated, and died early. Among his portraits are those of Mary, princess of Anjou, when princess of Denmark, and Dryden.

FAKIR (an Arabic word meaning a poor man), the name of a mendicant order in the
East Indies, like the dervishes of Persia and Turkey. The first condition of an Indian mendicant monk is poverty. He wears a rent robe, such as the Musulmans pretend the ancient prophets wore. In 10 things, according to Hassan al-Bassiri, he is like a dog: he is always hungry; he has no sure abiding place; he watches by night; he never abandons his master, even when maltreated; he is satisfied with the lowest place; he yields his place to whoever wishes it; he loves whoever beats him; keeps quiet while others eat; accompanies his master without ever thinking of returning to the place he has left; and leaves no heritage after death. The number of Musulman and Hindoo fakirs in India is estimated at more than 1,000,000; besides whom there are many other religious ascetics. Some fakirs remain isolated, go entirely naked, and sleep on the ground with no covering. They never use wood for making fire, but employ the dried dung of cows; regarding this as an act of devotion, since the cow is a sacred animal in India. They carry a cudgel, a battle axe, or spear, on which are hung rags of various colors, and they traverse the country begging and instructing credulous people in religion. It is dangerous both to his money and life for an unprotected person to meet them. Another class of fakirs unite into companies, and wear fantastic and many-colored robes. They choose a chief, who is distinguished by having a poorer dress than the others, and who has a long chain attached to one of his legs. When he prays he shakes his chain, and the multitude presses around him, embrace his feet, and receive his counsel and precepts. He has formulas for the cure of the paralytic, and especially of sterile women. One class of fakirs is highly honored. They are the children of poor parents, who live in retirement in mosques, devoted to the reading of the Koran and the study of the laws, till they become qualified for the duties of mollahs or doctors of theology. The fakirs often inflict upon themselves very severe penances. Some remain bent forward in the form of a right angle until they grow permanently into that shape. Others lay fire on their heads till their scalps are burned to the bone. Sometimes a fakir ties his wrists to his ankles, has his back plastered with filth, and then makes a journey of hundreds of miles, rolling along like a cart wheel, and stopping at the villages for rest and food.

FALASHA (Lat. Falasia), a town of Normandy, France, in the department of Calvados, 23 m. S. S. E. of Caen, on the river Ante, and on a branch of the Western railway; pop. in 1866, 8,631. It is built upon cliffs, commanded by an old Norman castle and surrounded by a picturesque country. It has a communal college, a public library, several ancient churches, and an equestrian statue of William the Conqueror, who was born here, erected in

1851. The celebrated fair of Guibray, instituted in the 11th century, is annually held here in August in a suburb of that name. The town has manufactures of cotton and hosiery. FALASHAS, the Jewish population of Abyssinia, numbering about 250,000, who have inhabited that country from time immemorial. Their name signifies exiles or wanderers, and they profess to have come originally from Pal-
estines and to have belonged to the tribe of Levi. They are Jewish in their modes of life, though not in their appearance, and differ from their co-religionists in regarding commerce as incompatible with the Mosaic law. They cultivate the soil, and excel in various trades, especially as architects. They are laborious and well behaved, but unable or unwilling to perform military duty, from which they are consequently exempt. They are so rigid in the observance of the Sabbath that they abstain even from dressing themselves on that day. They constituted in the higher regions of the country an independent tribe under the rule of their own kings and queens until the beginning of the 17th century, when they were driven from their mountain homes and compelled to reside among their enemies the Amharas. They live at present in the provinces of Dombea, Godjam, Quara, Tchelga, and Woggara; and their villages are easily recognized by the red clay pots at the top of their synagogues. They have the Old Testament in the Geaz language, and the apocryphal books which are accepted by the Abyssinian church. —See articles by Joseph Halévy in the Bulletin of the French geographical society, March and April, 1869.

FALCON, a bird of prey, belonging to the order raptores, family falconida, subfamily falconina, and to the typical genus falco (Linn.). This subfamily contains the following genera, in addition to falco, of which about a dozen species are described: hypotriorchis (Boio), with as many species; lernecidae (Gould), with two species, found in Australia; finscularia (Vieill.), with a dozen species; iteraz (Vigors), with six species, in India and its islands; and karagaus (Vigors), in South America, with a single species, characterized by having the lateral margin of the bill armed with two distinct teeth on each side. The birds of these genera may all be called falcons, from the common characters of a short bill, much curved from the base to the tip, with its sides more or less furnished with serrations called teeth; the cale covering the nostrils, which are rounded or linear; the wings lengthened and pointed, the second and third quills generally the longest; the tail lengthened and rounded; the toes long and slender, and claws curved and acute. The birds of the genus falco, which only will be treated in this article, are called noble birds of prey, because in proportion to their size they are the most courageous and powerful; they are also more docile, and were formerly much used in the sport of falconry to pursue and kill game, returning to their masters when called. The pigeon hawk (H. columbarius), and the sparrow hawk (T. sparverius), though both falcons, will be described under these names.

The falcons are found throughout the world, regardless of climate; they are powerful and rapid flyers, hovering over the prey and darting perpendicularly upon it; they pursue birds chiefly, but attack also the smaller quadrupeds. The common or peregrine falcon (F. peregrinus, Linn.) has a large and round head, a short thin neck, a robust body broad in front, stout short tarsi, covered with imbricated scales largest in front, the tibial feathers covering the knee, long and strong toes and sharp claws. The plumage is compact and imbricated, the feathers rounded on the back, broad on the breast, long and pointed on the sides; between the eye and bill and on the forehead they are bristly. The bill is blackish blue at the tip and pale green at the base, the iris hazel, the feet bright yellow, and the claws black. The head and hind neck in the adult male are grayish black tinged with blue, the rest of the upper parts dark bluish grey with indistinct dark brown bars; the quills dark brown, with transverse reddish white spots on the inner webs; the grayish brown tail has about 12 blackish bars, diminishing in breadth and intensity from the tip; the throat and front of neck white; a broad triangular mark of blackish blue extends downward on the white of the cheeks from the corner of the mouth; the sides, breast, and thighs are reddish white, with transverse dark brown spots; the under wing feathers are whitish, with transverse darker bars. The length is about 16½ in., the extent of wings 30, bill 1¼, tarsus 1½, and middle toe 2¼. In old males the tints of the back become lighter, sometimes ashy-gray; the young males are darker, with rufous tips and edges to the feathers, and the tail is blacker, with reddish white tips and bars; there is considerable variety at the different ages in the birds of the United States and of Europe. Bonaparte calls the American bird F. anatum. The adult female, as in birds of prey generally, is nearly one third larger than the male, being about 20 in. in length, 36 in extent of wings, with the beak, tarsus, and toes longer; the color of the upper parts is deeper brown, with the tips of the secondaries and tail white; the transverse markings run higher up on the breast, and are broader and
of deeper hue on the other parts; the color below is more yellowish, and the vent feathers are reddish. This falcon, which is also called the great-footed and the duck hawk, according to Audubon, was formerly rare in the United States, which it now can hardly be said to be. It flies with astonishing rapidity, turning in its course in the most surprising manner. A favorite prey is the duck, which it seizes on the wing, on the surface of the water, or on land; when within a few feet of its victim, it stretches out the legs and claws and drops upon the trembling bird almost perpendicularly; if the victim is light, it flies off with it immediately to some quiet place; if too heavy, it kills and devours it in the nearest convenient place. It has been known to attack a mallard on the wing, and even to pounce upon a wounded teal within a few yards of the sportsman. Pigeons, blackbirds, water fowl, and beach birds, and even dead fish, are eaten by this falcon. Turning the bird it has caught belly upward, it clears off the feathers from the breast and tears the flesh to pieces with great avidity. This species is solitary, except during the pairing of the breeding season, which is in very early spring; it is found in all parts of the United States and in Cuba, coming to the south in the winter months. The nest is made of coarse sticks, generally on the shelf of some precipitous rock; Audubon is of opinion that they breed in the United States; they are common on the shores of Hudson bay and arctic America in summer, according to Richardson; the eggs are rounded, reddish brown, with irregular markings of a darker tint. The peregrine falcon is distributed over temperate Europe, where the country is mountainous and the seacoast precipitous. When in full plumage and good condition, for its compact muscular form, great strength, boldness, and ferocity, it may be taken as the very type of a bird of prey; it is among birds what the lion and tiger are among mammals; fearless in attack, swift in pursuit, strong and fierce, it justly claims the first rank among the noble birds of prey.—Before the invention of gunpowder, falcons were very frequently trained to pursue herons and various kinds of game, and falconry was a favorite sport of kings and nobles; even now falcons are occasionally used for this purpose in Great Britain. Birds of prey have been trained to the chase from remote antiquity; the custom is mentioned by early writers, but it was not till the time of Huber, in 1784, that the distinction between birds of high and low flight, which had long been understood in practice, was shown to exist in the anatomical structure of the wings and talons. The falcons belong to the former division; from their long and slender and entire wings, when they wish to rise in the air vertically they are obliged to fly against the wind, though obliquely they easily mount to great elevations, where they sport rapidly in all directions; they carry the head straight; their claws are long, supple, and sharp, and their grasp is firm; they seize their prey at once if small and slow, but strike, repeatedly with their talons, to loosen and arraign the flight of heavier and swifter birds, and with great precision attack the vital part at the hollow of the back or between the shoulders and ribs. These birds have been called rowers from their mode of flight. The ignoble birds of prey, as the goshawk and other hawks, are called sailors; their wings are shorter and thicker, with their surface interrupted by the unequal lengths of the quills, and they fly to best advantage with the wind, sailing with the wings extended and motionless, allowing themselves to be carried along by the wind; their talons being shorter, less powerful, and straighter than in the falcon, they strike with less force and precision, and when they have seized a bird or a quadruped compress it to death or strangle it with their claws; their beaks are not toothed, and they can not open vertebrae or the skulls of the larger birds; they prefer to hunt in thick woods, while the falcons pursue their prey high in the air. Falcons and hawks are best trained from the nest; they have bells attached to their feet, jesses of soft leather to the tarsis, and hoods on the head which prevent them from seeing while they allow them to eat; birds taken after they have left the nest, or which have been caught in snares, are the most difficult to train, and confinement, hunger, fatigue, and purges are employed to subdue them to a point necessary for lessons; they are taught to leap upon the hand of their master to receive food, which is placed on a rude representation of the bird or animal which they are to be taught to pursue; from an effigy they are advanced to living animals, with more or less length of tether, until left at perfect liberty. The larger and older the bird, the more difficult the training, and the most ignoble are generally the most rebellious; in the order of docility these birds are the merlin, the hobby, the common falcon, and the goshawk (all noble birds); and the ignoble hawks are the least docile, though the goshawk is said to be very easily trained. They are fed with beef and mutton, deprived of all fat and tendon, and scrupulously cleaned of all dirt; they are taught to pursue other birds of prey, the heron, the crow, the pie, larks, quails, partridges, the hare, and other game. Descriptions of the lordly sport of falconry can be found in the romances of Walter Scott and other delineators of the days of chivalry. (See Falconry.) The falcon is a very long-lived bird; there is a tale that one which belonged to James I. in 1610, with a gold collar bearing that date, was found at the Cape of Good Hope in 1793, and, though more than 180 years old, was said to be possessed of considerable vigor; but the natural term of life of this species must be much less. The falcon of Henry IV. of France flew from Fontainebleau to Malta, 1,000 miles, in a day; and many similar instances of their speed are on record.—
The lanner (F. lanarius, Linn.) seems to be an undoubted species of northern Europe and Asia, and intermediate between the gerfalcon and the peregrine; it is about 1½ ft. long, with wings two thirds as long as the tail; its colors resemble those of the young peregrine, and the tail is barred with brown. The bill is pale bluish gray, with the upper tooth and the lower notch strongly developed; the legs and feet are colored like the bill. Some specimens are almost entirely white. The length is from 20 to 24 in., the extent of wings a little over 4 ft., the bill 1½ and the tarsus 2 in.; according to Audubon, in the immature state, as observed by him in Labrador, the female, though the larger and heavier bird, has the extent of wings less by an inch than the male; the weight of the male is a few ounces less, and that of the female a few ounces more than 3 lbs. The form is that of a very powerful bird, the tail being longer in proportion than that of the peregrine, and the tarsi feathered 1½ in. downward. It ranges over the northern regions of Europe and America; Iceland is one of its favorite resorts, so much so that the bird has received one of its most common names from this island; it is found along the precipitous shores of Norway and Sweden, and in Greenland, the arctic regions, and the Hudson bay district, extending as far south as Labrador, where Audubon found it breeding; it is rare in Great Britain, and is a northern and maritime species, especially frequent near the breeding places of sea fowl. In manner, flight, and cry it resembles the peregrine, being if possible more daring. In falconry this species was highly prized, and extraordinary prices were formerly paid for individuals; they were brought chiefly from Iceland and Norway. There is still much uncertainty about the varieties of this bird; naturalists generally make but one species, but falconers are of opinion that the Iceland and the Norwegian birds are distinct species; if the latter be true, the American bird may also prove different from any of the European species. The American bird is sometimes called F. Islandicus (Gmel.). Audubon describes and figures a pair of immature birds which he obtained in Labrador in August. The general color of the plumage in this condition is brownish gray above, the feathers having a narrow paler margin; the upper tail coverts, quills, and tail are tipped, spotted, and barred with brownish white; the throat is brownish white, with five streaks of brown, and the lower parts generally are of the former color, longitudinally patched with dark brown; the under tail coverts are striped alternately brown and white. The female has the same colors, except in having the two middle tail feathers spotted with white like the others, these in the male being without the spots. The nest found by Audubon was about 3 ft. in diameter, flat, made of sticks, seaweed, and mosses. The eggs, according to Mr. Yarrell, are dull white, mottled all over with pale reddish brown. They feed in Labrador on puffins, grousse, partridges, ducks, hares, and other animals of this size, and also on fish. Mr. Hancock (“Annals and Magazine of Natural History,” vol. xiii., 1864, p. 110), who described the Greenland falcon (F. gyrfalco).
Groenlandicus, Hanc) as a distinct species, says it is never dark-colored like the young of the Iceland falcon, its plumage from the nest being whiter than the mature livery of the latter, and not infrequently as white as that of the adults of its own species. The mature Greenland bird is distinguished from the young by the cordate and arrow-head markings of the back and scapulars; the young have above large oblong spots, with long narrow dashes on the head and lower parts, the marking from dark gray becoming with age almost black; the cere, feet, and toes also change from light livid blue to pale yellow. Like other falcons, it gets the mature plumage at the first moult. In fact, the Greenland falcon may be said to have a white plumage with dark markings, and the Iceland bird dark plumage with white markings; whether they are distinct species will be determined by the definition of what constitutes specific characters. Both species occur in America; the Greenland bird probably does not breed in Iceland, and is only occasionally seen there, driven from its more northern haunts by severe weather; the Iceland bird sometimes breeds in Greenland. The weight of evidence seems to be in favor of these birds being distinct species.—Other falcons, which have been trained to pursue game, are the H. subbuteo, H. asalon, and T. alaudarius, which will be described respectively under the popular names of Hobby, Merlin, and Kestrel.

FALCONE, Antello, an Italian painter, born in Naples in 1600, died in France in 1665. He was a pupil of Spagnololetto, and set up an academy of his own. At the time of Masaniello's revolt he formed his pupils into a secret band for retaliation upon the Spaniards. When the insurrection was ended he fled to France, where he was employed by Colbert. He is especially famous for his battle pieces. They are not numerous, and command great prices. Their excellence is in their extreme fidelity to nature, and their brilliant coloring. Salvator Rosa was one of his numerous pupils.

FALCONE, Hugh, a British paleontologist, born at Forres, Scotland, Feb. 29, 1808, died in England, Jan. 31, 1865. He studied at the universities of Aberdeen and Edinburgh, received his diploma as physician in 1829, was employed as surgeon by the East India company, and in 1832 as director of a botanical garden in one of the Anglo-Indian towns, whence he explored the Himalaya. He published "Selections from the Bostan of Saadi" (London, 1839), and (jointly with T. Troby Cantley) Fauna Antiqua Sivalensae (1840), a laborious work, with descriptions of numerous fossils in the Sivalik hills. The "Palaontological Memoirs of Hugh Falconer" (2 vols., 1868) include a sketch of his life.

FALCONE, William, a British poet, born in Edinburgh about 1730, lost at sea in 1769. He was the son of a barber, whose other children were all deaf and dumb. At the age of 18, being second mate of the Britannia, he was shipwrecked off Cape Colonna, on the coast of Greece, and was one of the three who survived the wreck, which afterward became the subject of his principal poem, "The Shipwreck." This was published in 1762. He compiled a "Universal Marine Dictionary" (re-published in 1815, enlarged and modernized by W. Burney, LL.D.), and wrote several poems, including a political satiric directed against Lord Chatham, Wilkes, and Churchill. In 1769 he sailed for India in the frigate Aurora, which, after touching at the Cape of Good Hope, was never heard from again.

FALCONET, Etienne Maurice, a French sculptor, born in Paris in 1716, died in 1791. He was a pupil of Lemoyne, and early gained distinction by a statue of Milo of Crotona. Many of his works were destroyed at the time of the revolution. None of them were equal in merit to the immense bronze equestrian statue of Peter the Great, which he executed at St. Petersburg, by order of Catharine II., in 1776-8.

FALCONRY, the art of training falcons or other birds of prey for the chase, the sport itself being called in English hawking, in French le vol. A falconry is also the place where such birds are kept. The practice is very ancient in Europe, and yet more so in Asia. We have no mention of it among the Romans till after the time of Vespasian. It was certainly in existence in the 4th and 5th centuries. In Britain it appears to have been a favorite recreation in the reign of Ethelbert II. of Kent, A.D. 760. King Alfred had his falconers, and a book on falconry is still extant attributed to Edward the Confessor. Harold II. is represented in the Bayeux tapestry as visiting the court of Duke William of Normandy with a hawk on his fist. The Domesday book makes frequent mention of falconries and eyries for breeding. In the time of Henry II., William Knot, the king's tenant, paid his rent at the exchequer in three hawks and three goshawks. King John was devoted to the sport. Nicholas, a Dane, was to give the king a hawk every time he came trading to England. The sport died out in England in the time of the Stuarts. In France falconry was most practised in the time of Francis I. (1515-47). His grand falconer had an annual revenue of 4,000 florins, and had under him 50 gentlemen and 50 falconers, the whole establishment costing annually 40,000 florins. Under Louis XIV. the institution was yet more expensive. Louis XVI. tried in vain to reduce the expense of the royal falconry; but finally the revolution swept it away. In Germany the sport was honored in the reign of Frederick II., and in the 14th century fiefs called Habichtlehen, or hawk tenures, were granted on condition of payment in trained hawks. The sport retained its existence in Germany till toward the close of the 18th century. In Italy falconry was a favorite pastime. In the East, the Persians are skilful in training falcons to hunt all manner of birds, and even gazelles.—The vocabulary of hawking in Eng-
land was as extensive as its ordinances, and several of its terms have been adopted into the language. Hawks' legs were their arms; their talons, pommes; wings, sails; the long feathers of the wings, beams; tail, the train; breast feathers, the mals; crop, the gorge. A cover for the bird's head was the hood. When the hawk fluttered to escape, it bated; to sleep was to jok; to stretch one wing back was to mantle; to shake itself was to rouse; to recross its wings again was to warble; to tear the feathers from its prey was to plume; to raise its prey aloft before descending was to truss; to descend on its prey was to stoop; to fly off after crows was to check. A living prey was

quarry: when dead, pelt. Taming a bird was called reclaiming, by the French affaitage; and an old, stanza, pattern hawk was called a make-hawk. No rank was excluded from the enjoyment of hawking, but each condition of men must confine themselves to their peculiar grade of hawk and quarry. The sincere office of grand falconer of England is hereditary in the family of the duke of St. Albans.—Among the most noted treatises on falconry is one written by Frederick II. of Germany (died in 1250), annotated by his son Manfred, and republished with several other treatises by J. G. Schneider in 1788 (2 vols., Leipzig). Others are: the famous "Boke of St. Albans," by Lady Juliana Bernard (fol., 1481), containing the "Treatises perteynyng to Hawkyng, Huntynge, and Fysshyng with an Angle;" "Hieroscothion, vel de Re A醑cetiptraria, a poem in three books," by De Thon (1584); "La fauconnerie," by Charles d'Espéron (Paris, 1605); Latham on "Falconry" (1618-18). Among the more recent works on the subject are "Falconry in the British Isles," by Salvin and Brodrick (London, 1855), and "Falconry, its Claims, History, and Practice," by G. E. Freeman (London, 1859).

FALERII (also called Equum Falecum or Fali- cum) is an ancient city of Italy, one of the 12 Etruscan cities, a few miles W. of the Tiber, and N. W. of Mount Soracte, near Civitâ Castellana. It was the capital and perhaps the only city of the Falisci, a people of Pelasgic origin, whose territory extended from the Tiber to Lake Vico, and who in the early ages of Rome were reckoned among the most dangerous enemies of the republic. It is first mentioned in 487 B. C., when the Falisci lent their support to the Fi- denates, who had revolted against Rome. It was besieged and taken by Camillus about 394. The inhabitants again joined the enemies of Rome in 356; made a treaty in 352; revolted anew about 319, and were subjugated; rose in rebellion again in 293, and again in 241, when they were punished by the destruction of their town. They were removed to a less defensible site in a colony that was established named Resonia flagellarum, from the famous temple of Jana. The latter site is now occupied only by a farm house and a ruined church, known as Sta. Maria di Falari, but a large portion of the ancient walls, with their gates and towers, still exists.

FALERIUS AGEM, a district in the northern part of ancient Campania, extending from the Massician hills to the bank of the Volturmus, from which the ancient Romans obtained one of their choicest wines. The Falernian wine was red, very spirituous, and most powerful when from 15 to 30 years old. Its excellence is celebrated by the Roman poets, particularly by Horace. It was declining in quality in the time of Pliny, from want of care in the cultivation, and the vineyards disappeared in the 6th century.

FALIERI, Marine, doge of Venice, the most celebrated of the several dukes of the same family, born about 1275, beheaded April 17, 1555. In 1846 he rendered eminent services to the republic as commander-in-chief at the siege of Zara in Dalmatia, which was taken after a splendid victory over Louis the Great of Hungary. Subsequently he was Venetian ambassador at Genoa and Rome. In 1584 he was summoned home from Rome, and elected doge although nearly an octogenarian. Within a month the entire Venetian fleet of 61 vessels was captured by the Genoese, with a loss to the former of 4,000 men killed and nearly 6,000 prisoners. Hardly had the new doge succeeded, Jan. 5, 1555, in concluding a four months' truce with Genoa, when a contest broke out in his own palace, which proved fatal to himself. A young nobleman of Venice, Michele Steno, enamored of one of the dogess' maids of honor, on occasion of one of the balls given during carnival, took liberties with her which, although excusable under the excitement of the season, gave umbrage to the doge, who ordered Steno to leave the palace. The young man, exasperated by this treatment, avenged it by writing upon the chair of the doge the following words: "Marino Falieri dali bella moglie, altri la gode ed egli la man- tiene ("Marino Falieri's beautiful wife is sup- ported by him, but enjoyed by others"). The doge's wrath knew no bounds, and as the senate and the councils refused to treat the affair as a question of state, and the criminal court sentenced Steno to only a brief term of imprisonment and a year's exile, Falieri determined to wreak vengeance by exterminating the whole body of the nobility, who were hated by the populace as tyrants. The day fixed for the consummation of this design was April 15, 1555, but the conspiracy was discovered on the evening previous; the doge was arrested, and after a full confession of his guilt, he was sen- tenced to death and beheaded. In the council hall of the palace, where the portraits of the doges of Venice are religiously preserved, a black drapery covers the spot intended for that of Falieri, bearing the inscription: Spanese Marino Falieri, decapitato. The fate of the doge has been a favorite theme with poets. Byron made it the subject of a tragedy, giving in the notes a full account of Falieri's life.
FALK

FALK, Johann Daniel, a German philanthropist and author, born in Dantzic in 1768, died Feb. 14, 1826. He entered the university of Halle, where he produced several satirical poems, which attracted the notice of Wieland, who introduced him into the literary circles of Weimar. He wrote an account of his personal intercourse with Goethe, which appeared after the death of both (Goethe aus näherem personlichen Umgange dargestellt, 2d ed., Leipzig, 1836). A selection of Falk’s writings appeared in 1818, and a new collection of his satirical works in 1826. He wrote for the Tauchenbuch, of which he was the editor (1797–1803), an article on the condition of hospitals in Berlin, which induced the government to reform them. In 1813 he founded at Weimar an institution for the education of poor children, which bears the name of Falkisches Institut.

FALKIRK, a municipal and parliamentary burgh of Stirlingshire, Scotland, on a commanding eminence, 24 m. W. of Edinburgh; pop. in 1871, 9,647. Its name, Fallow Kirk, is a translation of the obsolete English breck, both signifying speckled church. It has a fine parish church, several churches of dissenting congregations, a school of art, and a horticultural society. These are in Falkirk, and in the connected villages of Grahamston, Bainsford, and Carron, printing establishments, tanneries, breweries, a manufactory of pyremonic acid, the immense iron works of Carron, a foundry employing 500 men, and branches of the banks of Scotland and England. Its chief celebrity is due to its cattle fairs, the most important in Scotland, which take place annually in August, September, and October, each lasting from two days to a week. The last is the largest. These trysts, as the Scots call the fairs, have flourished more than 200 years. Falkirk was a place of note in the 11th century. The ancient parish church, built by Malcolm Canmore in 1057, was demolished in 1619 to give place to the present one. Here Edward I. in 1298 conquered William Wallace, and in 1746 the young pretender, Charles Edward, defeated the English army under Gen. Hawley.

FALKLAND, a royal burgh of Fifeshire, Scotland, at the base of the Lomond hills, 22 m. N. of Edinburgh; pop. in 1871, 1,144. The E. Lomond hill rises so abruptly behind it as to intercept the rays of the sun during several weeks in the winter. The town consists principally of a single street, and many of the houses have an antique appearance. The chief object of interest is the ancient palace, now in ruins, begun about 1500 and completed by James V., who died in it in 1542. It ceased to be a royal residence on the accession of James VI. To the English throne, but was visited by both Charles I. and Charles II. No traces now exist of the more ancient castle in which David, duke of Rothesay, was starved to death in 1402. The English family of Cary derive from this place the title of viscount.

FALKLAND, Lucius Cary, viscount, an English politician and man of letters, born at Burford, Oxfordshire, in 1610, killed Sept. 20, 1643. His father, Sir Henry Cary, who was made Viscount Falkland in the peage of Scotland in 1620, held various offices under James I. Lucius was educated at Trinity college, Dublin, and at St. John’s college, Cambridge, and at the age of 19 inherited the estate of his grandmother, wife of Chief Baron Tanfield, worth more than £2,000 per annum. He afterward married and settled at Great Tow near Oxford, and in 1638 became Lord Falkland by the death of his father. In his country life he had for his associates learned men from Oxford and London, and was distinguished for hospitality and considerate benevolence. Falkland wrote both in prose and verse. He studied theology deeply, published a “Discourse of the Infallibility of the Church of Rome,” and was the author of other works, now little known. He was chosen a member of the short parliament in April, 1640, for Newport, Isle of Wight, and afterward of the long parliament, and shared deeply in the determination to establish the government on a constitutional basis. He was a strenuous advocate of the bill of attainder, even when it was opposed by Pym and Hampden, who preferred proceeding by impeachment. He moved the im-
peachment of the lord keeper Finch. He distinguished himself in the attacks that were made on ship money, and on the judges who had pronounced the levying of it illegal, and in those which were directed against the church. But suddenly, without apparent cause, he left the reform party, and he who had said the bishops were stark mad, and therefore should be sent to Bedlam, was soon heard to complain that they who hated the bishops hated them worse than the devil, and they who loved them did not love them so well as their dinners. In the memorable debate on the grand remonstrance, Falkland was the second speaker, following Hyde, and against the remonstrance. His course on this occasion, with his earlier opposition to the abolition of the church, led the king to make him the offer of the post of secretary of state, which he accepted. Of the exact part which Falkland had in the government scarcely anything is known, but he and his two associates in the administration, Colepeper and Hyde, received marks of hostility in the commons. He wrote the royal answer to the parliament’s 19 propositions, then joined the king at York, and signed his declaration that he did not mean to make war on the parliament. Shortly afterward Falkland was removed from the commons, and placed on the list of those whom the parliamentary commander was ordered to exclude from mercy. He behaved with gallantry at the battle of Edgehill, and had his advice been taken the king would have won a complete victory. In some negotiations that followed, he labored earnestly for peace. The campaign of 1643 was for a long time favorable to the king, and Falkland accompanied him to Bristol, and thence to the siege of Gloucester. The advance of the parliamentary army compelled the king to raise the siege. In the first battle of Newbury Falkland placed himself at the head of John Byron’s regiment. Receiving an order to charge a body of foot, he advanced between hedges lined with musketeers, and received a ball in the stomach, from which he died instantly. The body was found the next day, and buried in Great Tew church. He left a wife and three sons. Among the best works which treat of him is Forster’s “Historical and Biographical Essays” (London, 1858).

FALKLAND ISLANDS (Fr. Malouines; Sp. Malvinas), a group in the S. Atlantic, belonging to Great Britain, and consisting of about 200 islands, 800 m. E. of the entrance to the strait of Magellan, between lat. 51° and 62° 45’ S., and lon. 57° and 62° W.; area, about 7,600 sq. m.; pop. in 1871, 812. All but two are very small. East Falkland is about 90 m. long, 20 m. broad, and 3,000 sq. m. in area; West Falkland, separated from it by a channel from 2½ to 18 m. wide, called Falkland sound, is 80 m. long, 25 m. broad, and about 2,800 sq. m. in area. The other principal islands are Great Swan, Saunders, Pebble, Keppel, Eagle, Weddell, and Lively. The coasts are very irregular, in some places rocky and precipitous, in others low. Bays and inlets are numerous, and East and West Falkland are nearly divided by several deep indentations. There are few rivers, the San Carlos, 30 m. long, which flows into the sea on the N. W. coast of East Falkland, being the largest. There are many fresh-water ponds and brooks. The surface is broken by ridges of bleak hills, the highest of which are in East Falkland, though the average elevation of West Falkland is the greater. Mt. Usborne, one of the Wickham hills, in the E. island, is 2,500 ft. above the sea; the other summits are from 800 to 2,000 ft. high. The country south of the Wickham hills is a level plain. The whole aspect of the group is dreary and inviting. The commonest geological formation is quartz, which in some places is seen covering the bottoms of the valleys, broken into sharp fragments, and disposed in level sheets or streams like rivers of stone. Sandstone and clay slate also occur. The soil of such portions as have been explored is mostly peat or sandy clay covered thinly with vegetable mould. The valleys of the streams are exceedingly rich. The climate is like that of England, but more equable. The temperature of summer ranges from 46° to 70° F., and that of winter from 80° to 50°; mean temperature of the year, 47°. Severe and destructive snow storms occasionally occur. There are no trees on the islands. The most important production is grass, which grows to a great length and possesses remarkably nutritious properties. Three or four kinds of bushes are found; the common garden vegetables of England thrive; barley and oats are cultivated, but wheat is raised with difficulty. The only quadruped indigenous to the islands is the warrah or wolf fox, which is peculiar to this archipelago. Other animals have been introduced by Europeans, and in East Falkland there are many thousand wild cattle sprung from stock thus introduced. Horses, sheep, wild hogs, rabbits, seals, and wild fowl are found, and many French and American vessels hunt the black whale off the W. coast of West Falkland. In 1871 the value of imports was £23,715, of exports £24,692; the revenue was £6,940 (about half of which is a parliamentary grant), the expenditures £6,824. The fisheries and the guano deposits on West Falkland are considerable sources of wealth. A British colony called Stanley, at the head of Port William inlet on the N. E. coast of East Falkland, has an excellent harbor, and is the only settlement in the whole group. Since 1869 the Falkland islands have been the seat of an Anglican bishop. The main object of the British government in keeping up the establishment here is to provide ships a place of call for water and fresh provisions. The total tonnage of vessels entered and cleared in 1871 was 59,979 tons. The islands were discovered by John Davis, in August,
1592, and were visited a century later by Strong, who called the sound Falkland, and the islands afterward took the same name. The French planted a colony on Berkeley sound, East Falkland, in 1763, and the English established themselves at Port Egmont, West Falkland, about two years later. The French in 1787 ceded their settlement to the Spaniards, who drove away the English in 1770. They afterward restored Port Egmont to the British, and some time later the islands were abandoned by both parties. Buenos Ayres founded a colony in East Falkland in 1828, which in consequence of a dispute was destroyed in 1831 by a United States man-of-war. It was shortly afterward given up to the British.

**Falk Laws.** See supplement.

**Falkner, Thomas,** an English missionary, born in Manchester in 1710, died at Plowden Hall, Jan. 30, 1784. He was the son of a surgeon, and followed the same profession in South America and other countries. While ill at Buenos Ayres he was attended by members of the society of Jesus. He abjured the Presbyterian faith to join that order, in which he distinguished himself by missionary labors during 40 years, and he was also employed by the Spanish authorities in surveying part of the South American coast. On the dissolution of the order he went to Spain, where he became chaplain to one of his countrymen, whom he accompanied to the vicinity of Worcester, England. He wrote a number of works in different languages, chiefly relating to the American continent. His principal publication, "A Description of Patagonia and the adjoining Parts of South America, and some Particulars relating to Falkland Islands," &c. (Hereford and London, 1774; abridged, "A Treatise of the Patagonians," &c. Darlington, 1792), was translated into German and French.

**Falling Stars.** See Meteoria.

**Fallmerayer, Philipp Jakob,** a German historian and traveller, born at Tschotzke, near Brixen, in the Tyrol, Dec. 10, 1791, died in Munich, April 26, 1863. He served as a sub-lieutenant in the campaigns of 1813-15, and subsequently became a professor in the college of Augsburg and in the lyceum at Landshut. He travelled in the East from 1831 to 1836, spent several years in southern France, Italy, and Geneva, made a second tour through Asia Minor in 1840, published the results of his ethnological and historical researches in Fragmente aus dem Orient (3 vols., Stuttgart, 1845), visited Palestine and Syria in 1847, was a member of the German parliament in 1848, and became a professor in the university of Munich, but was dismissed in 1849 on account of his liberal views. The most important of his historical writings are Geschichte des Kaiserthums Trapezunt (Munich, 1881), and Geschichte der Halbinsel Morea im Mittelalter (2 vols., Stuttgart, 1890-91). In the latter work he maintains that the present inhabitants of Greece have little or no affinity of race with the ancient Hellenes, and may be considered, notwithstanding their language, a branch of the Slavonic family. Many of his works were published in the Augsburg Allgemeine Zeitung belong to the best writings of their kind. His Gesammelte Werke, published after his death by Thomas, contains the Neu Fragmente aus dem Orient, and a large number of political, historical, and critical essays. His works exhibit a rare combination of profound scholarship and philosophical depth with the faculty of presenting the results of scientific researches in a perspicuous and graceful form.

**Falloppio, or Fallopia, Gabrielle,** an Italian anatomist, born in Modena about 1528, died in 1602. He was one of the three naturalists who, according to Cuvier, contributed to the revival of the study of anatomy in the 16th century, the other two being Vesalius and Eustachi. He was a pupil of Vesalius, and after travelling in Europe was for a time professor of anatomy at Ferrara, and afterward for several years at Pisa. In 1551 he was appointed professor of anatomy and surgery at Padua, where he also devoted himself to the study of botany, and became director of the botanical garden. He published in 1661 his principal work, Observationes Anatomicae, which was one of the best anatomical treatises of his century, and has been several times reprinted. He gave an exact description of the structure of the ear, one of the canals of which still bears his name. He also first indicated the use of the two ducts extending from the ovaria to the womb on each side of the fundus, which are called from him Fallopian tubes. After a short but brilliant career, in which he became distinguished as a professor, botanist, and surgeon, as well as anatomist, he died and left his chair to Fabricius, his pupil.

**Fallooux, Frédéric Alfred Pierre,** viscount de, a French author and statesman, born in Angers, May 7, 1811. He first made himself known by a history of Louis XVI. (Paris, 1840; 2d ed., 1848), and by his Histoire de St. Pie V. (3 vols., 1844; 3d ed., 1859), the former of which showed his legitimism, the latter his Catholic sentiments. In 1848 he was elected a member of the chamber of deputies, where he took his seat among the legitimists. After the revolution of February, 1848, Faloux was returned to the constituent assembly, where he boldly displayed his anti-revolutionary views. Appointed reporter in the question of national workshops, he moved the dissolution of the chamber, which was the signal for the uprising of the red republicans in June. On Dec. 25, 1848, he was made by Louis Napoleon minister of worship and public instruction, which post he resigned in October, 1849, in consequence of having been censured for submitting to the legislative assembly an organic measure relating to education without having brought it before the notice of the council of state. He then took his place in the legislative assembly. After the coup d'état of Dec. 2, 1851, he re-
tired from public life. In 1855 he became assistant editor of the Correspondant, the leading Catholic review, and took an active part in the violent controversy which that journal, in the name of the moderate section of the Catholic party, sustained against the Unisvers newspaper. Falloux published on behalf of his friends the pamphlet Le parti catholique. He also took an active part in the Catholic congress held at Mechlin in 1867, and with Mr. Dupanloup supported the doctrines of the syllabus. Among his later publications are: Mme. Suetschine, sa vie et ses œuvres (2 vols., 1859); La convention du 15 septembre (1864); and Lettres inédites de Mme. Suetschine (1866).

FALLOW DEER (Dama vulgaris), a cervine animal, distinguished from the stag or red deer by its smaller size, spotted coat, and palmed horns. There are two varieties, the one spotted, said to be descended from the spotted axis of India, the other deep brown, said to have been introduced into England from Norway by James I. It is remarkable that where fallow and red deer are kept together in the same parks, as often in Great Britain, they never associate in companies, much less are ever known to breed in common, but carefully avoid each other, even so far as to shun the places which either species may have chanced to frequent. The bucks of the fallow deer are much smaller than the harts of the red deer, and are easily distinguished by their horns or antlers, which, instead of being round and pointed at the upper extremity, with several forward tines or branches, are round only at the base near the head, having a single pair of brow antlers, and a single pair of anterior points a little higher up the stem, above which the horns spread out into flat palmed surfaces, projecting a little forward at the top, and having several posterior sharp snags or processes. The buck during his first year is called a fawn; the second, a pricket; the third, a sorrel; the fourth, a soro; the fifth, a buck of the first head; the sixth, a great buck. The fallow deer breed at two years old, and bring forth one, two, or three fawns; they come to their maturity at three years, and live to about 20. The rutting time of the buck commences about the middle of September, after which he is out of season, his flesh being no longer estiable. He sheds his horns in April or May, and his new ones are fully grown about the end of August. He is in height of season in July. The doe comes into season when the buck goes out, and continues until twelfth tide. She begins to fawn in May, and continues until midsummer. The bucks herd together, and are easy to be tamed, when they become impudently familiar and intimate. The cry of the buck is called braying or grunting, sometimes growling, as that of the hart is termed belling. The fallow deer are kept in England merely as ornaments to park scenery and for supplying venison to the table; never any longer, as of old, for sporting purposes. The venison is more succulent, tender, and juicy than that of the red deer, and it is not unusual to find the buck, in high season, with three and four inches of fat on the brisket. Various pastures produce various degrees of excellence in the venison. Where the wild thyme is abundant, the flesh is noted for its delicious aromatic flavor; and it is remarked that the more level and luxuriantly pastured parks of the south of England produce the fattest venison, while those of the north, abounding in broken ground, glesis, and knolls, covered with broom and fern, yield it of the highest flavor.—So late as the reigns of the Stuart monarchs, shooting the fallow deer with the crossbow, coursing it with greyhounds in the royal parks and chases, and turning it out to hunt with the buckhounds, were royal amusements. The buckhounds are still kept up, and the “master of the buckhounds” is a high, honorary court office, held by some sporting nobleman; but they no longer hunt the buck, the hart or stag of the red deer having been for many years substituted for the fallow buck, as being far more cunning, stronger, fester, and capable of supporting longer chases. In many parts of Germany, in Denmark, Norway, and Sweden, the fallow deer runs wild in the forests, and is strictly preserved for the use of royalty and the territorial nobles. It is usually driven with hounds or beaters, and killed with fowling pieces and buckshot. The height at the shoulders is about 3 ft. The skin affords a valuable leather, and the horns are used for knife handles and similar purposes.

FALL RIVER, a city and port of entry of Bristol co., Massachusetts, on Mount Hope bay, an arm of Narragansett bay, at the mouth of Taunton river, 45 m. S. by W. of Boston; pop. in 1850, 11,524; in 1860, 14,026; in 1870, 26,706, of whom 11,478 were foreigners. It is on high ground, with well shaded streets, handsome churches, and lovely green-beds. The stone being obtained from large quarries in the vicinity. It contains two handsome parks, and includes the localities popularly known as
Copitout, Globe village, Mechanicville, Mount Hope village, New Boston, and Steep Brook. The Old Colony and Newport railroad furnishes connection with Boston, and the Providence, Warren, and Bristol line connects the city with Providence; while daily lines of steamers run to Providence, Newport, and New York. The harbor is safe, commodious, easy of access, and deep enough for the largest vessels. The value of the foreign commerce for the year ending June 30, 1873, was $317,028; 58 vessels of 11,833 tons entered from and 27 of 4,643 tons cleared for foreign ports; entered in the coastwise trade, 413 steamers of 870,592 tons, and 47 sailing vessels of 8,208 tons; cleared, 815 steamers of 828,081 tons, and 25 sailing vessels of 6,075 tons; employed in the cod and mackerel fishery, 37 vessels of 554 tons; belonging to the port, 14 steamers of 2,311 tons, and 127 sailing vessels of 11,411 tons. Fall River, from which the city derives its name, is a small stream emptying into the Taunton River near its mouth. It rises in a chain of ponds connected by a narrow channel and covering an area of 5,000 acres, which lie about 2 m. from the bay and receive the outlets of several other sheets of water embracing an area of 2,000 acres more. The river, having a descent of 130 ft. in less than half a mile, and furnished with an unfalling supply of water, possesses remarkable advantages as a mill stream, which have been improved by the erection of a dam at the outlet of the ponds. The lower banks are entirely built up with manufactories, which are now, however, mostly run by steam. The manufacture of cotton goods, which has increased with remarkable rapidity within the last 10 years, is the chief industry, Fall River containing more spindles than any other city in the United States. Print cloths are the principal item of production. The number of corporations is 84, of which 18 have been formed since 1870, having a capital of $14,870,000, and owning 41 mills with 29,531 looms and 1,269,788 spindles; hands employed, 15,145; monthly wages, $492,950; bales of cotton consumed annually, 182,775; production, 881,575,000 yards. The city also contains a woolen mill, two print works, a bleachery, a brass founding and finishing establishment, several iron works and machine shops, producing steam engines, cotton machinery, turbine water wheels, &c., four manufactories of cotton thread, 2 of twine and wicking, 2 of files, 6 of carriages, 4 of soap, 1 of soda, 5 of oil, 8 of weavers' reeds and harness, a ship-building establishment, and several planing mills. There are seven national banks, with an aggregate capital of $2,250,000, and four savings banks, having in October, 1873, 21,900 depositors and deposits to the amount of $5,691,092 95. The Fall River savings bank, incorporated in 1828, had 11,128 depositors and deposits to the amount of $5,274,998 09. Fall River is divided into six wards, and is governed by a mayor, a board of aldermen of one member, and a common council of three members, from each ward. There is a police court, and a police force of about 30 men under the city marshal, and 1873 there were a high school, 29 grammar, 29 primary, and 8 evening schools, having 99 teachers and an average attendance of 4,277 pupils. The total expenditure for school purposes was $44,412 46, which was for teachers' wages. The public library contains 10,678 volumes. Two daily and two weekly newspapers are published. There are 24 churches, viz.: 7 Baptist, 3 Congregational, 2 Christian, 1 Episcopal, 1 Friends', 5 Methodist, 1 New Jerusalem, 1 Presbyterian, 6 Roman Catholic, and 1 Unitarian.—Fall River, formerly a part of Freetown, was incorporated as a separate town in 1808. Its name was soon after changed to Troy, but in 1834 the old appellation was restored. It received a city charter in 1894, and in 1899 the town of Fall River, Newport co., R. I., with 3,377 inhabitants, was annexed to it.

**FALMOUTH**

A central county of Texas, intersected by Brazos river, area, 795 sq. m. Pop. in 1870, 9,851, of whom 4,681 were colored. Most of the surface is occupied by rolling prairies, the soil of which is a rich black loam. The river bottoms are still more fertile, and produce good crops of Indian corn and cotton, with plenty of oak, pecan, cedar, cottonwood, and other timber. Limestone underlies a large part of the country, and a vast ledge of crossing the bed of Brazos river causes the falls from which the county derives its name. The chief productions in 1870 were 408,094 bushels of Indian corn, 31,424 of sweet potatoes, and 14,126 bales of cotton. There were 5,269 horses, 2,405 milch cows, 17,693 other cattle, and 7,406 swine. Capital, Marlin.

**FALMOUTH**, a parliamentary borough and seaport of Cornwall, England, beautifully situated on the S. W. side of a harbor on the channel, at the mouth of the river Fal, 45 m. S. W. of Plymouth; pop. in 1871, 5,294. It is on a steep acclivity, reaching to the water's edge, and consists mainly of one long narrow street. It has many good stone houses, and a plentiful supply of water in the N. and S. quarters, where the ground is arranged in terraces. The harbor, one of the finest in Great Britain, is formed by the estuary of the Fal. It is 12 to 16 fathoms deep, and can contain 500 vessels. It is defended on the west by Pendennis castle, and on the east by St. Mawes castle, both built by Henry VIII. and improved by Elizabeth. Pendennis castle underwent a long siege by Cromwell, traces of whose encampment near by are still visible. It now contains barracks, storehouses, magazines, &c. Sir Walter Raleigh visited the harbor on his return from the coast of Guiana, and paid attention to its possibilities, which had till then been altogether overlooked. The entrance is about 1 m. wide, and the bay, which runs 6 or 7 m. inland, is a favorite resort of British vessels in time of war. Before the in-
FALSE IMPRISONMENT. The jealous watchfulness of the common law of England for the protection and preservation of personal liberty is nowhere proved more distinctly than in the provisions of the law respecting what is technically called false imprisonment. In their extent and fulness they are quite peculiar to that law; and while the principles on which they rest, and some of the rules derived from them, may be discerned even in Saxon times, they have certainly been developed and systematized in later ages, as the worth of personal liberty became more accurately estimated and the means of preserving it better understood. False imprisonment, in the law of England and the United States, may now be defined as any intentional and unlawful restraint of a person. It may be: 1, the restraint or arrest of a person under color of law, by means of an illegal or insufficient process; 2, such restraint or arrest by means of a legal instrument, but at an illegal time, as on Sunday or any other day generally prohibited, or at any time which is illegal and unauthorized in respect to the person restrained; 3, without color or pretense of law, as when one confines another to his room or house without legal authority to do so. False imprisonment may be with force or without force, and then brought about by the one attacking the other, by words only, or even by gestures only, compel him by fear to abstain from going where he has a right to go, or to go where he wishes not to go and is under no obligation to go. It is false imprisonment to confront a man in the street, and, without touching him, constrain him to arrest his course or change it against his will. The remedies for false imprisonment are threefold: 1, an action for trespass; 2, where the party imprisoned may recover not only such damages as are capable of being estimated on the evidence, but such further sum as the jury, in cases where the party had no reason to believe his conduct lawful, may consider proportioned to the character of the wrong; 3, the writ of habeas corpus for immediate relief from the restraint; 3, indictment at common law for false imprisonment of an individual. The party may be severely punished. In some of the United States there are various statutory provisions respecting certain kinds of false imprisonment.

FALSE PRETENCES. Any one who acquires property by means of false pretences has no legal title to it, and it may be recovered by the party from whom it was thus obtained, and who is still the legal owner. (See Fraud.) But besides this civil remedy, the statutes of England and of the United States make the obtaining of property by false pretences an indictable offence. The expressions in our state statutes are various; but in general, any one who by means of false pretences, and with a fraudulent design, obtains possession of money, merchandise, goods, or wares of any description, or obtains the signature of another to a deed, note, or other contract or writing for the transfer of property or the payment of money, becomes liable under the statute. It is impossible to define precisely the false pretences which expose one to this punishment. It is obvious that they cannot be slight suggestions which are without foundation, or open and obvious falsehoods by which no man in his senses would be deceived. In the first place, they must be intended to produce an injurious effect; and in the next place, they must be such as would be likely to deceive a person of ordinary discretion, who is to a reasonable extent on his guard. They must relate to existing facts, and not be mere promises of something to be done in the future. If the pretences or misrepresentations are numerous, and most of them are honest, but some one of them is at once material, false, and fraudulent, the offence is committed; and this is so, although the statements which were true exercised the principal influence in obtaining the property for the guilty party, provided it would not have been given him but for the statement also which was false. It may be remarked that no false pretences made after the contract was completed will constitute the offence, even if they were made before the property was delivered, unless the delivery or execution was at first withheld, and then brought about by the false premises. At common law the nearest provision to this of the modern statutes was one which exposed to indictment and punishment as a cheat a person who obtained possession of money or goods by means of what were called false tokens, by which was meant forged papers, or other counterfeit symbols or evidence of ownership or authority. Language similar to this ancient rule is used in some of our statutes, as in those of Pennsylvania. The first statute against false pretences in England was 30 George II., c. 24; and this has been followed by the different states of the Union, more or less exactly. The most common instances of indictments under these statutes are for the obtaining of goods by buyers under false pretences as to their responsibility or resources; and it was mainly to suppress these that the statutes were intended. FALSEN, Knutten Magnus, a Norwegian historian, born at Opale, Sept. 17, 1782, died in Christiania, Jan. 18, 1880. He was a son of
the poet Enevold von Falsen, was educated in Copenhagen, became a lawyer and judge in Norway, and was a member of the constituent diet of Eidsvold (1814), and deputy to the storting (1816–29). He voluntarily gave up his title of nobility, but became unpopular in 1829, when, as attorney general, he defended such measures of the government as conflict ed with his formerly enunciated views. The storting in 1824 withdrew the appropriation for his office, upon which the king appointed him governor of Bergen, and in 1827 he removed to Christiania as justice of the supreme court. His principal work is Norges Historie (4 vols., Christiania, 1826–34).

**FALSTER**, an island of Denmark, in the Baltic, S. of Seeland, separated from the island of Møen on the northeast by Grôn sound, and from that of Lolland on the west by Guldborg sound, and forming part of the bailiwick of Maribo; area, including the little island of Hassels, 181 sq. m.; pop. in 1870, 28,000. In the northeast it is mountainous, and elsewhere entirely flat. On account of its abundant fruits, it is called the orchard of Denmark. Grain, flax, hemp, hops, honey, and wax are the principal products. Cattle, hogs, and poultry abound, and peat, chalk, and building stone are found. The chief town, Nyköbing, contains a castle and cathedral, and has an active trade; pop. in 1870, 3,646. Originally in possession of Danish nobles, the island passed into that of the royal family, and a number of Danish queens resided in its capital in the 16th and in the early part of the 17th century.

**FAMAGOSTA, or FAMAGUSTA** (anc. Arsinoë; Turk. Mausa), a seaport town of the island of Cyprus, on the E. coast, about 12 m. N.W. of Cape Grego; pop. about 800. It is about two miles in circumference, and is little more than a confused mass of ruins, the ancient streets being choked up and the buildings fallen into decay; but the fortifications erected by the Genoese and Venetians are in a good state of preservation, and the cannon mounted by the latter still defend its walls. Of the 200 churches which it formerly contained, but a few ruined ones remain. The Latin cathedral of St. Nicholas, now a mosque, is a fine specimen of mediaeval architecture. In it the Lusignans were crowned kings of Jerusalem, and many interesting monuments are still to be seen in its interior. On the N. side of the town are bomb-proof and cannon foundries. There are but two gates, one on the south and one opening toward the port. The harbor is narrow and its entrance is shallow, but there is good anchorage before the town in eight fathoms of water. Without the walls is the suburb of Varoskia, which contains most of the population. The surrounding country is bisected by a low ridge, and the ridge is turned into fertile cultivated land. To the north are the ruins of ancient Salamis.—The original city was one of those built by Ptolemy Philadelphus in honor of his sister Arsinoë. After the battle of Actium it was called by Augustus Fama Augusta. It was of great importance during the crusades, and it was there that Guy de Lusignan received the crown of Cyprus in 1191 from Richard I. of England. It was taken by the Genoese in 1178, and in 1489 by the Venetians, under whom it became a rich and powerful city. In 1571 it fell into the hands of the Turks, after a siege of four months, in which it was nearly destroyed; and in 1785 an earthquake completed its ruin.

**FAN,** an implement used to produce coolness by agitating the air. Its origin is traced to remote antiquity, and is ascribed by some historians to Kan-si, daughter of a Chinese mandarin. On the walls of the tombs at Thebes, the king is represented surrounded by his fan-bearers, who bore the instruments as standards in war, while in times of peace they waited upon the monarch in the temple, refreshing him with the fans, and at the same time driving away insects from the sacred offerings. The fashion spread from Persia to Asia Minor, and in Greece we find traces of fans as early as 500 B.C. The wings of a bird joined laterally and fastened to a delicate handle constituted a most beautiful fan. The fan of the priest of Isis, when the worship of that divinity began to prevail in Greece, was semicircular, made of feathers of different lengths, pointed at the top, and waved by a female slave. In one of the tragedies of Euripides a eunuch is introduced, who says that, in accordance with Phrygian custom, he had used his fan to protect Helen against the effects of the heat. In Rome fans became popular among the ladies, and at dinner parties slaves with fans stood behind the guests. The Roman poets, Ovid, Terence, and Propertius, frequently allude to their use, and the pictures on the ancient vases also indicate the wide prevalence of the fashion. In the middle ages fans made of eagle or peacock feathers, in various forms, and fastened with a handle of gold, silver, or ivory, were a lucrative article of trade in the Levantine markets, whence they were exported to Venice and other Italian cities. Catharino de'Medici introduced into France fans which could be folded in the manner of those of the present day. Having been favorably received by the court of Henry II., they became objects of great luxury during the reigns of Louis XIV. and Louis XV. No toilet was considered complete without a fan, the cost of which frequently exceeded $700. Picturesque landscapes, the most exquisite paper of China, the most elegant taffeta of Florence, precious stones and diamonds, all in turn were put in requisition to enhance the appearance and the value of the fan. Manufacturers of fans soon became numerous in Paris; and previous to 1673, when a charter was granted to them by Louis XIV., they had organized themselves into a corporation. In England, fans were in fashion in the time of Henry VIII. In Shakespeare's "Mer ry Wives of Windsor" an allusion to fans is made by Falstaff to Pistol. A superb fan set
with diamonds was presented to Queen Elizabeth on New Year's day. Among the articles received by Cortes from Montezuma were five fans of variegated feathers, four of them with 10 and one with 13 rods embroidered with gold, and one fan also with variegated featherwork, with 37 rods plated with gold. In Spain at an early day fans were special favorites with ladies, and the Spanish lady, as well as the ladies of Spanish extraction in the new world, are inimitable in their management (manejo) of the fan (abanico). They carry on conversations with it, and a book might be written to explain the complicated code of signals by which they express their feelings with the fan.—The best and cheapest lacquered fans are produced in China. Those made of ivory, bone, and feathers are destined chiefly for the European and American markets. The fans which the Chinese use are of polished and spattered bamboo, covered with paper, and vary in price from 20 to 30 cents a dozen. The state fan which is used on great occasions in China and India is precisely of the same semicircular form and pointed top which was in fashion among the ancient Greeks. In Japan the fan is to be seen on all occasions, among all classes of society, and in the hands of men, women, and children. Where the European takes off his hat in token of politeness, the Japanese performs the same courtesy by waving his fan. In the schools diligent scholars receive fans in reward for their zeal. A gentleman, in giving alms to a beggar, puts the money upon his fan. When a criminal of rank is sentenced to death, his doom is proclaimed to him by presenting him with a fan, and his head is taken off while he bows and stretches out his hand to receive the fatal gift. Japanese fans, generally ornamented with grotesque pictures, are exported in large quantities to the United States, where they are as popular as those of China for their cheapness and neatness.—Fans were used for allegorical purposes in the mythology of Greece, and the Egyptian custom of employing them in temples and for religious purposes has also been perpetuated in the ritual of the modern Greek church, which places a fan in the hands of its deacons. They are used to this day in Rome on public occasions, especially at the festa di cattedra, when the pope is escorted by two men who carry feather fans with ivory handles, but do not use them.—Next to China and Japan, France is most celebrated for the manufacture of fans, but beautiful fans are also made in the United States, in England, at Brussels, Geneva, Vienna, and at various other places. The manufacture in France presents an interesting instance of the subdivision of labor, 20 different processes being required to produce a fan which sells for less than three cents, as well as one worth several thousand francs. This industry gives employment to thousands of persons, and its aggregate value for Paris alone is estimated at 7,000,000 francs annually. In France, the fan is occasionally used by gentlewomen at the theatres, having first appeared on a warm summer evening of 1828, during the representation of Corinamdr at the comic opera. Hence the name of corinamdr applied in France to fans used by gentlemen.

FANEOUL, or Fanarites, the Greeks who reside in the Fanar or Phanar district of Constantinople, whose ancestors had escaped the fury of the Turkish conquerors after the capture of that city by Mohammed II (1453). Originally employed as translators of public documents and as secretaries and stewards of distinguished personages, they gradually acquired by their wealth, as well as by their abilities and intrigues, great political, financial, and social importance in Turkey. The office of dragoman of the divan was for the first time intrusted to a Greek in the 17th century, under Mohammed IV., and has since been uniformly conferred upon Fanariotes. Most of the hospodars of Moldavia and Wallachia from the latter part of the 17th century to the beginning of the 19th were also members of Fanariote families (Callimachi, Cantacuzene, Cantemir, Dunkas, Karadjia, Mauuri, Sitzo, Ypsiante, &c.). The Fanariotes were the principal bankers of Constantinople, and as such dispensers of an extensive patronage in the bestowal of public offices. FANDANGO, the oldest national dance of Spain, especially of Andalusia. Some suppose it to have been introduced by the Moors; others say the Moors found the dance already established, and trace its origin to the most ancient. It is danced in three-four time by one couple only, usually to the accompaniment of the guitar, and occasionally also of the tambourine, the dancers beating time with castanets and the spectators by clapping their hands. The Andalusian villagers dance it almost every evening, and always on Sunday. The dancers and their friends sing improvised couplets; and the lady offers her cheek to the men present after each dance, and allows herself to be embraced by all of them. The fandango is described as vivacious, graceful, and voluptuous. Repeated efforts of the clergy to suppress the dance have proved inadequate to overcome its popularity among the peasantry.

FANEUIL, Peter, the founder of Faneuil hall in Boston, born of a French Huguenot family in New Rochelle, N. Y., in 1700, died in Boston, March 8, 1743. He became a merchant in Boston, and in 1740, after the project of erecting a public market house in Boston had been discussed for some years, he offered at a public meeting to build a suitable edifice at his own cost as a gift to the town; but so strong was the opposition to market houses that, although a vote of thanks was passed unanimously, the offer was accepted by a majority of only seven. The building was commenced in Dock square in September of the same year, and finished in two years. It comprised a market house on the ground floor, and a town hall with other rooms (an addition to the original plan) over it. In 1761 it was destroyed by fire; in 1762 it
was rebuilt by the town; and in 1776, during the British occupation of Boston, it was used for a theatre. In 1806 it was enlarged by the addition of another story, and was increased in width. During the revolutionary period it was the usual place of meeting of the patriots, from which it gained the name of the cradle of American liberty.

FANFANI, Pietro, an Italian philologist and novelist, born at Pistoia, Tuscany, in 1817. He studied medicine, but gave his attention chiefly to philology, and in 1847 founded at Pistoia a magazine relating to that science (Ricordi filologici). The next year he enlisted in the war against the Austrians, and fell into their hands. After his release he published (1849) critical comments on the dictionary of the academy della Crusca, which involved him in an acrimonious and successful controversy with that institution. Gioberti obtained employment for him in the ministry of education at Turin. Subsequently he held an office under the Tuscan government at Florence, where in 1859 he became director of the famous Marucellian library, which post he still held in 1873. He has published Etruria, studi di filologia, di letteratura, di pubblica istruzione e di belle arti (2 vols., Florence, 1851–3); Il Borghini, giornale di filologia e di lettere italiane (3 vols., 1858–9); Vocabolario dell’uso toscano (2 vols., 1863); Commento alla Divina Commedia d’Anonio Fiorentino del secolo XIV. (3 vols., Bologna, 1886); and Lettere prelettive di eccellenti scrittori (2d ed., 1871). Among his other writings are: La Paolina, a novel in the Florentine dialect (2d ed., 1888); Una bambola, a story for children (1889); and Cecco d’Ascoli, a historical narrative of the 14th century (1870; Leipsic, 1871).

FANNIER, Francois Auguste and Francois Joseph, French engravers and carvers, brothers, the former born at Longwy in 1818, and the latter in 1822. Adopting the profession of their father, they received with the assistance of their grandfather, M. Fauconnier, an excellent training, and reached by their joint labors a greater eminence in carving and embossing on metals than any artist since Benvenuto Cellini. They were rewarded with prizes at the exposition of 1849, and the elder brother, who produced large works in gold with base reliefs at that of 1805, was made chevalier of the legion of honor. Their subsequent joint masterpieces are two shields representing incidents from Orlando furioso, executed for the duke de Luynes.

FANNING. L. A N. W. county of Georgia, bordering on Tennessee and North Carolina; area, 428 sq. m.; pop. in 1870, 5,492, of whom 114 were colored. The surface is mountainous. The chief productions in 1870 were 3,947 bushels of wheat, 7,027 of rye, 113,754 of Indian corn, and 6,210 of oats. There were 3,472 cattle, 5,123 sheep, and 7,571 swine. Capital, Morganton. H. A. N. E. county of Texas, separated from the Indian territory by Red river, and drained by Sulphur fork of that stream, and by Bois d’Arc creek; area, about 500 sq. m.; pop. in 1870, 19,207, of whom 2,484 were colored. It consists principally of highly fertile prairie lands. The chief productions in 1870 were 17,648 bushels of wheat, 476,565 of Indian corn, 53,472 of oats, 28,193 of sweet potatoes, 128,885 lbs. of butter, and 5,699 bales of cotton. There were 7,041 horses, 20,468 cattle, 5,681 sheep, and 18,846 swine. Capital, Bonham.

FANNING, James W., an officer of the Texian revolution, born in North Carolina, killed at Goliad, Texas, March 27, 1836. He was a captain in the Texian service in 1832, and on Oct. 28, at the head of 90 men, with Capt. Bowie, defeated a superior Mexican force near Bexar. Gen. Houston soon afterward made him colonel of artillery and inspector general. In January, 1836, he set out to reinforce Dr. James Grant near Matamoros. On reaching the place, learning that the Mexicans were not there, he returned to Houston. At Refugio he learned the destruction of Grant’s party and fell back to Goliad, which he put in a state of defence. But by Houston’s order he marched toward Victoria, and on March 19 was attacked at the Coleta river by a Mexican force under Gen. Urrea. Throwing up a breastwork of wagons, baggage, and earth, the Texans defended themselves with spirit until night interrupted the fighting. Col. Fannin being among the wounded. The battle was renewed on the 20th, but the Mexicans having received a reinforcement of 500 men, with artillery, a capitulation was signed, by which it was agreed that the Texans should be treated as prisoners of war, and as soon as possible sent to the United States. Having surrendered their arms, they were taken to Goliad, where on the 24th an order was received from Santa Anna requiring them to be shot. At daybreak the next morning the prisoners, 857 in number (the four physicians and their four assistants being spared), were marched out under various pretexts, and fired upon in divisions. Fannin was killed last. Many attempted to escape, and were cut down by the cavalry, but 27 are believed to have eluded pursuit.

FANNING, David, a Tory and freebooter of North Carolina during the war of the revolution, born of low parentage in Wake co., N. C., about 1756, died in Digby, Nova Scotia, in 1825. He seems to have been a carpenter, but led a vagabond life, trafficking with the Indians, and being connected for some time with the notorious Col. McGirth on the Pedee. When Wilmington was occupied by the British in 1781, Fanning, having been robbed by a party of men who called themselves whigs, attached himself to the Tories, collected a small band of desperadoes, and scourced the country, committing frightful atrocities, but doing such good service to the British that Major Craig rewarded him with the royal uniform, and gave him a commission as lieutenant colonel in the militia. He captured many prominent whigs, hanging
those who had incurred his personal resentment upon the nearest tree. His name was a terror to the whole country; he was excepted in every treaty and enactment made in favor of the royalists, and was one of the three persons excluded by name from the benefits of the general act of pardon and oblivion of offenses committed during the revolution. On the other hand, his romantic mode of life and personal daring, displayed many times in battle, drew around him numerous followers, whom he disciplined with great strictness. He is said to have commanded at one time 200 or 300 men. When the whigs began to gain the ascendency in North Carolina, he went to Florida, and afterward to St. John's, N. B., where he assumed a respectable deportment, and became member of the assembly. About 1800 he was sentenced to be hanged for rape, but escaped, and was afterward pardoned.

FANO, a seaport of central Italy, in the province of Pesaro, on the Adriatic, near the mouth of the Metauro, 30 m. N. W. of Ancona; pop. about 20,000. It is surrounded by old walls, built by the emperor Augustus, in whose honor was erected here a triumphal arch of white marble, which is still standing. Few cities of central Italy surpass it in artistic treasures or richness of the surrounding soil and scenery. The cathedral is adorned with 16 frescoes by Domenichino, representing events in the life of the Virgin. Many of the 13 other churches, and several public buildings and private mansions, contain paintings by the great Italian masters, marbles, statues, and fine monuments. It is the seat of a bishop, and has a lyceum, a gymnasium, a technical school, a public library, and a theatre considered one of the finest in Italy. The manufactures are chiefly of silk stuffs and twist, and the trade is in corn, oil, &c. The port was once much frequented, but is now choked up with sand, and visited only by small coasting vessels.

Fano occupies the site of the ancient Fanum Fortuna, so called from a temple of Fortune built by the Romans, and commemorate of their victory over Hasdrubal on the river Metaurus, in the second Punic war. It was the scene of a victory by Narses over the Goths under Totila. In 1511 Pope Julius II. established here the first printing press in Europe with movable Arabic types.

FANSHAWE, Sir Richard, an English poet and diplomatist, born at Ware Park, Hertfordshire, in June, 1608, died in Madrid, June 16, 1686. He studied in Jesus college, Cambridge, and in the Inner Temple. He then went abroad to study manners and languages, and on his return home became secretary to the embassy at Madrid, where he remained till 1688. On the outbreak of the civil war he declared for the crown, and was made secretary to the prince of Wales. In 1686 he was appointed treasurer to the navy under Prince Rupert, and two years later he was made a baronet, and sent to Madrid to implore the assistance of Spain. He was taken prisoner at the battle of Worcester, but being released passed several years in retirement, translating the "Lusiad" of Camoëns, and upon the death of Cromwell joined Charles II. at Breda. He was appointed master of requests and Latin secretary to the exiled monarch, and after the restoration, was elected to parliament, and was sent upon diplomatic missions to Madrid and Lisbon, negotiating the marriage of Charles with the infant Catharine of Portugal. Besides his version of the "Lusiad" (1655), he translated the Pastor fido of Guarini and the odes of Horace, and wrote a few short original poems. The "Original Letters and Negotiations of Sir Richard Fanshawe, the Earl of Sandwich, the Earl of Sunderland, and Sir William Godolphin" (5vo, London, 1734) is a valuable contribution to history. The "Memoirs of Lady Fanshawe," written by herself, with extracts from the correspondence of her husband, edited by Sir N. II. Nicolas, was published in London in 1850.

FANTEE, a country of the Gold Coast, W. Africa, bounded N. W. and N. by Assin and Dubbin, E. by Aquapim, S. by the gulf of Guinea, and W. by Wassaw, lying near lat. 5° 30' N., lon. 1° W. Capital, Mankasim. It is watered by several rivers, is said to be fertile and populous, and has several important trading stations along its coast. The inhabitants are remarkably clean, are more muscular than the Ashantees, and may be distinguished from other African tribes by small scarifications on the back of the neck and the upper part of the cheek bones. Their heads are high and round, and their color is a dull brownish red. They have long faces with jaws protruding to an unusual extent, flat noses, thick lips, and very large ears. The dress of both sexes consists
of a single piece of cloth wrapped loosely around the body. They pay a nominal obedience to chiefs called caboceers, besides whom every village has its local magistrate. They formerly governed or influenced a seaboard district extending about 100 m. along the coast. About 1807, becoming involved in a war with the king of Ashantee, they obtained the active interference of the English, who had a small fort in Anamboe, one of their towns; but this alliance, while it plunged the British into a disastrous quarrel, proved of no benefit to the Fantees, whose territory after a long struggle was occupied by the victorious Ashantees. In 1829 the Fantees, encouraged by the British, rebelled, but were again subdued, the British being defeated by the Ashantees, and their commander, Sir Charles McCarthy, captured and put to death. In 1826, however, the British defeated the Ashantees and compelled them to retire to their own territories. From that time for nearly half a century the Fantees were unmolested under British protection. But in 1872 the Dutch possessions on the Gold Coast were transferred by treaty to Great Britain, and in 1873 Koffee Calcaill, king of Ashantee, complaining that some of the stipulations of his treaties with the Dutch had been violated by the British, declared war against them, overran and ravaged the Fantee territories, and in September was threatening Cape Coast Castle with a numerous army. The British government, holding itself bound to protect its allies, the Fantees, sent a powerful force to the Gold Coast under command of Gen. Wolseley, who in November was advancing toward Coomasie, the Ashantee capital, driving before him the army of Koffee Calcaill, which was estimated to be about 40,000 strong.

(See Gold Coast.)

FANTI, Manfredo, an Italian general, born in Carpi, Modena, about 1810, died April 6, 1885. He took part in 1831 in the unsuccessful insurrection against the Austrians, served afterward in the French army, passed into the royal service of Spain in 1835, and returned at the outbreak of the revolution of 1848 to Italy, where he became a major general in the Sardinian army. In 1855 he commanded one of the four brigades sent to the Crimea, and in the war of 1859 took part as lieutenant general in the battles of Magenta and Solferino. In January, 1860, he accepted the portfolios of war and of marine in the cabinet of Count Cavour, in February became senator, and in September commanded the expedition against the Papal States. He left the cabinet in 1861, and in 1862 became commandant general of the military department of Florence.

FARADAY, Michael, an English chemist and natural philosopher, born at Newton, Surrey, Sept. 22, 1791, died at Hampton Court, Aug. 25, 1867. His father was a blacksmith, of a good family, and very poor. From his home in London was a bookseller's and bookbinder's shop kept by George Riebau, and there Faraday went, when 13 years of age, as an errand boy, on trial, for one year. It was a part of his duty at first to carry round the newspapers that were lent out by his master. At the end of a year he became an apprentice to Riebau, the indentures to continue seven years. "In consideration of his faithful service," no premium was given to the master. Faraday says of himself: "While an apprentice I loved to read the scientific books which were under my hands, and among them delighted in Marcret's 'Conversations on Chemistry' and the electrical treatises in the 'Encyclopaedia Britannica.' I made such simple experiments as could be defrayed in their expense by a few pence per week, and also constructed an electrical machine, first with a glass vial, and afterward with a real cylinder, as well as other electrical apparatus of a corresponding kind." "My master," he says, "allowed me to go occasionally of an evening to hear the lectures delivered by Mr. Tatum on natural philosophy at his house, 58 Dorset street. The charge was one shilling per lecture, and my brother Robert (who was a blacksmith) made me a present of the money for several." That he might be able to illustrate scientific lectures, he took lessons in drawing of a Mr. Masquier, who also lent him Taylor's "Perspective," "which I studied closely," he says, "copied all the drawings, and made some other simple ones." Among the notes Faraday has left of his own life occurs the following: "During my apprenticeship I had the good fortune, through the kindness of Mr. Dance, who was a customer of my master's shop, and also a member of the royal institution, to hear four of the last lectures of Sir Humphry Davy in that locality. Of these I made notes, and then wrote out the lectures in a fuller form, interspersing them with such drawings as I could make. I wrote to Sir Humphry Davy, sending as a proof of my earnestness the notes I had taken." He was invited by Davy to call upon him, which resulted in his appointment as assistant in the laboratory of the royal institution, whither he went in March, 1813. In October of the same year he went with Davy abroad, as amanuensis and assistant in experiments. The tour lasted only a year and a half, but was full of the most vivid interest to young Faraday. In the latter part of April, 1816, they returned to England, and Faraday, now 28 years of age, resumed his place as assistant in the laboratory, and was also made assistant in the mineralogical collection, and superintendent of the apparatus, at a salary of 30 shillings per week. During the year 1816 he gave seven lectures before the "City Philosophical Society:" 1, on the general properties of matter; 2, on the attraction of cohesion; 3, on chemical affinity; 4, on radiant matter; 5, 6, and 7, on oxygen, chlorine, iodine, fluorine, hydrogen, and nitrogen. In 1817 he was appointed assistant editor of the Quarterly Journal of Sciences, and was an analyst of some caustic lime from Tuscany, which
had been sent to Davy by the duchess of
Montrose. In 1817 he gave a second course of
lectures before the city philosophical so-
ciety, at the tenth of which, on carbon, he
used notes for the first time, instead of read-
ing his lectures. In 1818 he investigated the
subject of sounding flames, showing that they
were not dependent, as De la Rive had sup-
posed, upon the sudden expansion and con-
densation of vapor, but that they were con-
nected with musical vibrations produced in a
manner similar to the tones of a flute or of
an organ pipe. He obtained the sounds as
well when using a flame of carbonic oxide gas
as when using one of hydrogen. In 1819 he
made a tour on foot through Wales, and kept a
journal in which there are many passages man-
ifesting his intense love of nature and his vivid
powers of description. In 1820 he published a
paper on two new compounds of chlorine
and carbon, and on a compound of iodine,
carbon, and hydrogen. It was read before the
royal society, and was the first which was
published in the "Philosophical Transactions."
On June 12, 1821, he was married to Miss Sa-
rach Barnard, a daughter of an elder in the
Sandemanian church, and, having obtained
leave, took his wife to reside at the royal in-
sitution, where they remained until they
moved to the house assigned them in Hampton
Court by the queen in 1838. A month after
his marriage he became a member of the San-
demanian church. His ideas of religion are
indicated by the following quotation from a
lecture delivered on medical education in 1854:
"High as man is placed above the creatures
around him, there is a higher and far more
elevated position within his view; and the ways
are infinite in which he occupies his thoughts
about his fears, or hopes, or expectations of a
future life. I believe that the truth of the fu-
ture cannot be brought to his knowledge by
any exertion of his mental powers, however
elevated they may be; that it is made known
to him by other teaching than his own, and is
received through simple belief of the testimony
given. Let no one suppose for a moment that
the self-education I am about to commend, in
respect to the things of this life, extends to any
consideration of the hope set before us, as it
man by reasoning could find out God." In
1821 there occurred the only unpleasant cir-
cumstance that seems ever to have been con-
nected with his life. Dr. Wollaston was the
first person to entertain the idea of causing a
wire to revolve around a magnet, or upon its
own axis, and in a visit to Davy at the royal
institution made some experiments and con-
versed upon the subject, during a part of
which time Faraday was present. It greatly
excited his interest, and he could not refrain
from making experiments, the result of which
was that in the months of July, August, and
September he wrote a history of the progress
of electro-magnetism, which was published in
the "Annals of Philosophy." In the latter
month he made the discovery of the rotation
of a wire in a voltaic circuit round a magnet,
and of a magnet round a wire. He says: "I
did not realize Dr. Wollaston's expectation
of the rotation of the electro-magnetic wire
round its axis; that fact was discovered by
Ampère at a later date." These experiments
and publications of Faraday created consider-
able feeling, so much that the matter was dis-
cussed two years afterward, when he was pro-
posed as a member of the royal society. He
was charged with trespassing upon the prov-
ine of another, and with using another's im-
plements in cultivating the field; but his un-
blemished character in all other relations, and
the great discoveries which he made in this
abstruse department of electro-chemistry and
electro-magnetism, at last removed all tinge
of imputation of wrong intention; and long
before he closed his labors all men of science
were heartily glad that Faraday had followed
his inclinations. About the year 1822 and for
some time after he investigated the subject of
the liquefaction of vapors and gases, and in
1823 examined a substance which had been
regarded as pure chlorine, but which Davy in
1810 had proved to be a hydrate. Faraday
first analyzed this hydrate, and then at the
instance of Davy subjected it to the action of
its own pressure on being heated in a strong
sealed tube, by which means he obtained liquid
chlorine. Extending his experiments to other
gases, he succeeded in reducing a number of
them to a liquid state. His first memoir was
read before the royal society April 10, 1823,
and the second on Dec. 19, 1844. Prof. Tynd-
dall says that while making his first series of
experiments an explosion occurred by which
18 pieces of glass were driven into his eyes.
In 1825 he published a paper in the "Philos-
ophical Transactions" on new compounds of
carbon and hydrogen, in which he announced
the discovery of benzole. But his mind contin-
ually reverted from chemistry to physics, and
in 1826 he was again engaged upon the subject
of vaporization, in which he came to the con-
clusion that a limit exists, and that our atmos-
phere does not contain the vapors of what are
usually denominated the fixed constituents of
the earth's crust. During the year he had ten
papers in the "Quarterly Journal," one of the
principal being on pure casca
tchouc, his analy-
sis of which is given in the article on that
substance in this work. In 1825 Faraday was
appointed with Sir John Herschel and Mr.
Dolland on a committee to examine the manu-
facture of glass for optical purposes. Their
experiments continued for four years, when
Faraday delivered his first Bakerian lecture
"On the Manufacture of Glass for Optical
Purposes." This paper required three succes-
sive sittings of the royal society, and although
the investigation had not much immediate
practical use, it led to other and very impor-
tant discoveries. In 1831 he published a paper
on vibrating surfaces, in which he solved the
problem of the cause of the collection of leopodium seeds and other light bodies upon the vibrating parts of sounding plates, instead of upon the nodal lines where sand is collected, by showing that the light bodies are prevented from settling on the nodal lines by minute whirlwinds formed in the air over the vibrating parts. In 1827 he published his "Chemical Manipulations" (1 vol. 8vo; 2d ed., 1830; 3d ed., 1842). In April of this year he gave his first course of six lectures before the royal institution upon the atmosphere, gases, vapor, chemical affinity, definite proportions, flame, galvanism, and magnetism as evolved by electricity. Between February and May he delivered twelve lectures at the London institution on the subject of chemical manipulation. In December he commenced a course of lectures on chemistry to juvenile audiences. His power of imparting the elementary principles of science to youthful minds was wonderful, owing not only to the logical simplicity of his mind, but to his happy choice of and manner of making experiments. These courses of lectures succeeded each other from year to year, and it was also his habit to deliver popular lectures on Friday evenings at the royal institution throughout nearly his whole scientific career. In 1829 he was appointed lecturer on chemistry in the royal academy at Woolwich. In 1831 he commenced his celebrated series of electrical researches, which were continued through a great number of years. He investigated the induction of electric currents and the evolution of electricity from magnetism; and although Oersted was the discoverer of electromagnetism, and Ampère its expositor, Faraday made the science of magneto-electricity substantially what it is at the present day. In this year he also began to develop his theory of lines of magnetic force. In 1833 he was appointed the first Fullerian professor of chemistry at the royal institution, and during the same and the succeeding year he studied the laws of electro-chemical decomposition, and applied the word electrode in place of pole to the conductors connected with a decomposing cell, the fluid in which he called an electrolyte, and the act of its decomposition electrolysis. The positive electrode he called the anode, and the negative the cathode, and also applied the terms anions and cations to the chemical elements of the electrolytes which pass respectively to the anode and cathode. He now applied himself to the determination of electric quantity, and for this purpose devised his voltmeter, by which he showed that the amount of electricity generated in a voltaic battery depends upon the amount of chemical decomposition, thus establishing the doctrine of "complement of action" or "contraction". He investigated the contact theory of Volta, and in doing so developed the ideas which he always afterward entertained on the conservation of force, illustrating the fallacy of the contact theory of galvanism by showing that if true a force could be produced without drawing its supply from any consuming source. His first great paper on frictional electricity was sent to the royal society Nov. 90, 1837. In his investigation of this subject he developed his inductive theory of electricity, and by numerous memorable experiments illustrated the "specific inductive capacity" of dielectrics, in which he supposed the molecules of the dielectric to form a chain of communication between the inducing and the induced body. He also, during the years 1838-8, made experiments for the Trinity house on electric light for lighthouses, a subject which again in the latter part of his life engaged much of his attention. In 1840 he was elected an elder in the Sandemanian church, but held the office only for 54 years, during which period, when in London, he preached on alternate Sundays. His great labors had impaired his health, and in 1841 he went with his wife to Switzerland, spending much of the time at Interlaken and at the falls of Giessbach, returning at the end of September in the same year. In 1842 he made experiments upon the generation of electricity by steam, prompted thereto by the invention of the celebrated hydro-electric machine of Sir William Armstrong, and showed that it was caused by friction, and not by vaporization, as had been supposed. He performed very little laboratory work till the end of 1844, indulging in the mean time in needful rest. In the beginning of 1845 he made a second series of experiments on the condensation of gases, and about the first of September began the investigation of the magnetic relations of light, which led him to the discovery of the peculiar phenomena of magnetoelectric action. In November he announced his discovery of the "Magnetization of Light and the Illumination of the Lines of Magnetic Force." Whatever doubt there may be as to the soundness of his theory in every particular, his paper is full of the profoundest thought. "I have long," he says, "held an opinion almost amounting to a conviction, in common I believe with many other lovers of natural knowledge, that the various forms under which the forces of matter are made manifest have one common origin; in other words, are so directly related and mutually dependent, that they are convertible, as it were, into one another, and possess equivalents of power in their action." He always held that the theory of gravitation, not as it existed in the mind of Newton, but as commonly understood, embraced an absurdity, by supposing that when the manifestation of attraction between two bodies decreased in proportion to the square of their distance from each other, an equivalent of energy was lost; thus denying the doctrine of "suction". He was the first to consider it established. In December of the same year he published a memoir addressed to the royal society on the "Magnetic Condition of All Matter," in which he discussed the phenomena presented by diamag-
nec bodies, or such as are repelled by the poles of a magnet instead of being attracted, like iron or other paramagnetic bodies, as he termed them. Between this time and 1851 he was much occupied with the magnetic condition of gases, finding, among other facts, oxygen to be powerfully paramagnetic. Among the papers published is one on the diamagnetic condition of flame and gases in the "Philosophical Magazine" for December, 1847, and two elaborate memoirs on atmospheric magnetism sent to the royal society on Oct. 9 and Nov. 19, 1850. He applies his theory of the lines of magnetic force to the solution of the cause of the distribution of magnetism in the earth's atmosphere, and of annual and diurnal variations; and although it has been found that the variation in the declination of the magnetic needle is connected with solar spots, it can scarcely be doubted, as Tyndall remarks, "that a body so magnetic as oxygen, wafting the earth and subject to variations of temperature, diurnal and annual, must affect the manifestations of terrestrial magnetism." Faraday was opposed to the atomic theory, and it is very difficult, perhaps impossible, to comprehend his idea of the subject. In the place of an atom as a particle of matter he substituted a point or centre of force, and connected points of force with lines of force. He says: "This view of the constitution of matter would seem to involve necessarily the conclusion that matter fills all space, or at least all space to which gravitation extends; for gravitation is a property of matter dependent on a certain force, and it is this force which constitutes the matter. In that view matter is not mutually penetrable; but each atom extends, so to say, throughout the whole of the solar system, yet always retaining its own centre of force." In 1858, at the request of many friends, he was induced to investigate the phenomena of table-turning," and he prepared apparatus with which to test one of the phenomena in question. The investigations were conducted with great care, but he discovered no manifestations of any of the forces, natural or supernatural, which had been suggested as possibly concerned in the phenomena. In 1854 he made a series of experiments connected with submarine telegraphy, which were of great value. In 1855 he brought his experimental researches on electricity to a close, having followed them, along with his other investigations, during a quarter of a century. "The record of this work which he has left in his manuscripts and republished in his three volumes of 'Electrical Researches' will ever remain," says his biographer, Dr. Bence Jones, "as his noblest monument: full of genius in the conception; full of finished and most accurate work in the execution; his quantity of work made it impossible that one man could have done so much. Lastly, the circumstances under which this work was done were those of penury. During a great part of these 26 years the royal insti-

FAREWELL
handsome parish church, and Independent and Wesleyan Methodist churches, free schools, and a hall for a philosophical institution. Ship building was once actively carried on, but has declined. Earthware, bricks, and terra cotta are manufactured in large quantities, and the latter is largely exported. There is also a considerable trade in grain, canvas, rope, and timber. Fareham is a resort for sea bathing.

FAREL, Guillaume, a French reformer, born near Gap, in Dauphiny, in 1489, died in Neufchâtel, Sept. 13, 1565. While studying at Paris he embraced the new doctrines, and went with his friend Lefèvre d'Étапes to Meaux, where he began to preach. He returned to Paris in 1523, went to Basel the next year, became intimate with Zwingli, Haller, Grebel, and other reformers, quarreled with Erasmus, and was banished from Basel, all within a few weeks, and then retired to Strasburg, where he was intimate with Bucer. Preaching afterward at Montbéliard and other places, his intemperate zeal drew him into many troubles. One day he interrupted a procession in honor of St. Anthony by snatching the statue of the saint and throwing it into the river. To escape the consequences he fled, and travelled in Alsace and Switzerland. In 1527 he went to Aigle and taught school under an assumed name. In 1532, with Antoine Saunier, he represented the reformed churches in the synod convened by the Vaudois of Piedmont at Chamforans, and on his return was invited to a conference with the Catholics at Geneva, where the controversy became stormy. Blows were exchanged, and the magistrates had to interfere. He was ordered to leave the city, returned in 1533, was again banished, came back in 1534 with letters from the seigniory of Bern, and in 1536 persuaded Calvin to aid him in the organization of the reformed church at Geneva. The party of “Libertines” gaining the upper hand in the election of 1568, Farel and Calvin were banished. Farel went to Strasburg, and organized the Protestants there amid much opposition. In March, 1548, a body of troops under Claude de Guise fell upon a congregation gathered around him at Gorze in France. Farel was wounded, and narrowly escaped with his life. He then settled as pastor at Neufchâtel. In 1557 he was sent to the Protestant princes of Germany to ask their assistance for the Vaudois, and soon after he incurred the displeasure of Calvin and others by marrying a young girl. In 1561 he preached at Gap with all the violence of his youth, and was thrown into prison, from which his followers released him, letting him down from the rampart in a basket. Farel was a fine scholar and excited great admiration by the brilliancy of his oratory. His writings were numerous, but mostly of temporary interest.

FARIA Y SOUSA, Mafalda de, a Portuguese and Spanish poet, was born in Portugal, March 18, 1590, died in Madrid, June 8, 1649. He was a son of Amador Perez de Erro, and assumed the name of his mother, who belonged to the ancient Portuguese Faria family. He was incited to poetical composition by his admiration for Albania, as he called Catharina Machado, who became his wife. After his marriage he settled in Madrid, and from 1630 to 1634 he was special envoy to Rome. On his return he was placed for some time under arrest, the pagan allusions and inferences in his Comentarios sobre la Lusiada (2 vols., Madrid, 1639) having given offence to the inquisition, though he regarded himself as a devout Roman Catholic. His subsequent effusions, collected under the title of Fuentes de Aganipo (4 vols., Madrid, 1644–48), are in Spanish, excepting 200 sonnets and a few other pieces in Portuguese. His Discursos morales y politicos, published under the title of Noches claras, consist of dialogues, divided into seven nights. His principal historical works are: Epitome de las historias portuguezas (Madrid, 1623; enlarged ed., Brussels, 1730); Asia Portuguesa (8 vols., Lisbon, 1666–78); Europa Portuguesa (6 vols., Lisbon, 1667–78); and Africa Portuguesa (1681). He was among the first trustworthy writers on China, and his Império de China, edited by Father Semmedo (Madrid, 1842), has been translated into French and Italian. Lope de Vega called him the prince of critics.

FARIBAULT, a S. county of Minnesota, bordering on Iowa, and drained by Blue Earth river and its branches; area, 720 sq. m.; pop. in 1870, 9,940. The surface is mostly prairie; the soil is fertile. The Minnesota and Northern and the Southern Minnesota railroads pass through the county. The chief productions in 1870 were 552,940 bushels of wheat, 137,496 of Indian corn, 894,992 of oats, 25,786 of barley, 29,321 of potatoes, 15,988 tons of hay, and 250,645 lbs. of butter. There were 2,995 horses, 8,325 milk cows, 4,864 other cattle, 4,127 sheep, and 3,394 swine. Capital, Blue Earth City.

FARIBAULT, a town and the capital of Rice co., Minnesota, at the confluence of the Cannon and Straight rivers, and on the Iowa and Minnesota division of the Chicago, Milwaukee, and St. Paul railroad, 46 m. S. of St. Paul; pop. in 1870, 8,045. It is the seat of the state asylum for the deaf, dumb, and blind, and of an Episcopal academy, and contains several other schools, six or eight churches, two weekly newspapers, two national banks, and several flour mills, saw mills, foundries, &c.

FARINELLI (originally Broschi), Carlo, an Italian singer, born in Naples or in Andria, Jan. 24, 1705, died in Bologna, July 15, 1782. The extraordinary beauty of his soprano voice was attributed to his having been emasculated. He was a favorite pupil of Porpora, and met with brilliant success at the principal theatres of Italy. In 1754 he went to London, where he soon created an excitement. He performed three years in England, and netted every year £25,000. In France his success was equally
great. In Madrid he dissipated the melancholy of Philip V., became the king's chief favorite, and after his death was similarly honored by Ferdinand VI., receiving an annual salary of $10,000, on condition that he should sing only for the royal ears. The career prevailed upon Ferdin- and to organize a theatre in the palace, for which he engaged eminent artists from Italy, and of which he became the director. For 20 years he ruled the court of Spain, not only by the charms of his voice, but gradually by his influence in political affairs. In 1789, on the accession of Charles III., Farnielli fell into disgrace, and three years later was ordered to leave the kingdom. He then went to Bologna, and built a splendid palace in its vicinity, in which he passed the rest of his life.

FARJON, Benjamin L. See supplement.

FARNER, Hugh, an English theologian, born in Shropshire in 1714, died in London, Feb. 5, 1787. He was educated at the academy in Northampton under Dr. Doddridge, and became pastor of a dissenting congregation at Walthamstow, Essex, where he wrote several theological tracts. He removed to London in 1761, and became afterward preacher to the congregation of Salters' hall, and one of the Tuesday lecturers at the same place. He published an "Inquiry into the Nature and Design of our Lord's Temptation in the Wilderness" (1761), a "Dissertation on the Miracles" (1771), an "Essay on the Demoniac of the New Testa- ment" (1779), and a work entitled "The General Prevalence of the Worship of Human Spir- its in the ancient Heathen Nations" (1788). He considered miracles to be absolute proofs of a divine mission.

FARNER, John, an American genealogist, born in Chelmsford, Mass., June 12, 1789, died in Concord, N. H., Aug. 13, 1838. After teaching school for ten years, he studied the early settlement of New England, and his "Genealogical Register," published in 1816, is the first book to contain the names of nearly all the first European settlers in that region. A new and enlarged edition of this work, by James Sav- age of Boston, was published in 1860-62. Mr. Farmer superintended an edition of Belknap's "History of New Hampshire," to which he added many valuable notes; and he contributed various papers to historical and anti- quarian societies, and to periodicals.

FARNESI GENERAL, in France, financial and privileged associations which before the revolu- tion of 1789 took upon lease various branches of the public revenue. This system originat- ed in the 18th century, when Philip the Fair, is considered of certain sums paid to him, several times permitted Lombard bankers and Jews to collect the taxes. The consequent exactions, cruelties, imprisonments, and even executions, were considerable and painful; but they were particularly burdensome, and as they were in the reign of Louis XIII. the lessees had become a power in the state, and often trans- ferred their leases to still more unscrupulous subordinates. In 1780, under the regency, the individual leases were united in a ferme générale, which was let to a company, whose members were called fermiers généraux. Their number was originally 40, afterward increased to 60. In consideration of an annual payment of 85,- 000,000 livres, they had the privilege of levying the taxes on articles of consumption; and on the renewal of this privilege in 1726, 80,000,- 000 livres annually were paid. In 1774 the farmers paid 135,000,000 francs for this right, and in 1789, 180,000,000, and yet made im- mense fortunes. In 1789 the contracts of the farmers general were quashed by Silhouette, but the system soon revived, as it was favor- able to the court and ministers. The constitu- ent assembly in 1790 suppressed the associa- tion. In 1794 all the farmers general then living were brought before the revolutionary tri- bunal, and condemned; 28, including Lavoisier the chemist, were executed May 8, 1794, and the remaining three some days afterward.

FARNE, Fearn, or Fern Islands, several small islands and rocks in the North sea, from 2 to 5 m. from the English coast, and nearly oppo- site Bamborough. Two lighthouses have been erected on the largest. In rough weather the passage between the isles is very dangerous, and several disastrous shipwrecks, attended with great loss of life, have occurred here.

FARNESI, a family of Italian princes, who derived their name from their ancestral castle of Farneto near Orvieto, and whose genealogy is traced to the middle of the 13th century. Prominent as a soldier among the early mem- bers of the family was Pizzaro, who commanded the Florentine army in their victorious battle against the Pisans at San Piero, in May, 1365, and died of the plague within a few weeks. The historical celebrity of the house dates from 1534, when Cardinal Alessandro Farnese became pope under the name of Paul III. In 1546 he erected Parma and Piacenza into a duky for the benefit of his natural son, Pizz- rao Lurio, a dissolute and cruel ruler, against whom many nobles revolted in concert with Gonzaga, the imperial governor of Milan, at whose instigation he was assassinated Sept. 10, 1547.—His son Ottavio (1520-36) was recon- ciled with Austria through his wife, the famous Margaret of Parma, natural daughter of Charles V., and his reign of over 30 years was peace- ful and happy.—He was succeeded by his son Alessandro (1546-92). He was educated by his mother, and enlisted in the service of Spain in early youth. He fought in the naval battle of Lepanto in 1571, and was sent in 1577 to the Netherlands, where in the following year he took part in the victory of Gembloux, won by Don John of Austria over the Dutch. He suc- ceeded Don John as governor of the Low Countries, and forced the Belgian provinces into submission, subduing particularly Antwerp, Breda, Tournaï, Dunkirk, Bruges, Ypres, Ghent, and Antwerp (1579-86), the latter city after one of the most memorable sieges re- corded in history. On his father's death in
1856 he inherited the duchy, but did not even visit his dominions. In 1858 he was put in command of the armada which Philip II. of Spain sent against England; but being shut up with his army in Antwerp by the Dutch fort, he was only a spectator of its disastrous failure. In 1690 he invaded France at the head of the Spanish army and relieved Paris, which was then besieged by Henry IV. In 1692 he marched into Normandy, and obliged Biron to raise the siege of Rouen, one of the principal cities held by the leaguers; but he received here a wound which afterward proved fatal. Being attacked by Henry IV., who hemmed in his army between the Seine and the English channel, he foiled the efforts of his opponent, and succeeded in landing his troops on the opposite bank of the river, when they returned to the Netherlands. As for himself, he was unable to proceed further than Arras, where he breathed his last. He was a man of consummate military and diplomatic genius. A bronze equestrian statue of him by John of Bologna adorns the principal public square at Piacenza. — His successor was his son by the princess Mary of Portugal, Ranuzzio I. (1589-1692). He was a lover of science and art, but notorious for his ferocity against noble families, a number of whom he had executed, confiscating their property for alleged conspiracy. He married a niece of Pope Clement VIII. — His son and successor Odoardo (1612-46) was fond of magnificence and lavish in the expenditure of money, and possessed various accomplishments. But, insatiable in his ambition, he entered into an alliance with France against Spain and Austria in 1633, by which he nearly lost his duchy. In 1639 Pope Urban VIII. deprived him of the duchy of Castro, upon which Odoardo had raised money which he was unable to pay. After five years of wrangling Castro was restored to him through the intervention of France and Venice. — Ranuzio II., his son and successor, was the fattest of a family noted for obesity. He died in 1694, and was succeeded by his son Francesco, who died in 1727, and was followed on the throne by his brother Ascanio. This prince, born in 1760, was likewise exceedingly corpulent, and cared for little besides eating and sleeping. Leaving no issue, he designated as his successor Don Carlos, son of Philip V. of Spain, and of his niece Elizabeth Farnese. The Farnese family became extinct with him in 1781, and the rule of Parma and Piacenza passed into the hands of the infante of Spain, consequent upon a convention signed in Vienna in the same year. — The Farnese palace in Rome, now belonging by inheritance to the deposed king of Naples, was finished under the direction of Michel Angelo, who designed the whole upper part of the building with its imposing entablature. It is regarded as the finest piece of architecture in Rome, and was constructed of blocks of travertine which were taken by the nephews of Pope Paul III. from the theatre of Marcellus and the Colosseum. The grounds are adorned by two fountains, whose granite basins, 17 ft. long and 4 ft. wide, were taken from the baths of Caracalla. The most celebrated statuary has been removed to the museum of Naples, including the torso Farnese, or Farnese bull, and the Farnese Hercules, or the Hercules of Glycon. Among the few monuments which remain in the palace is a colossal one representing Alessandro Farnese crowned by Victory, sculptured out of a column taken from the basilica of Constantine. The most exquisite paintings are the frescoes of Annibale Carracci and his pupils in the gallery on the upper floor. — The villa Farnesina, in the Lungara of the Trustevers, opposite the Corsini palace, was designed by Baldassare Peruzzi for Agostino Chigi (1566), who gave here in 1516 an extravagant entertainment in honor of Leo X.; the plate, on being removed from the table, was thrown into the Tiber. This palace, mainly celebrated for its frescoes by Raphael and his pupils, became the property of the Farnese family, and passed with its other possessions to the Neapolitan Bourbons. The kings of Naples supported here an academy of painting, and eventually sold the palace to the Spanish duke Ripalda, who still owns it. — The Farnese gardens (Orti Farnesiani) occupy the whole northwestern summit of the Palatine hill, and contain interesting ruins of the palaces of the Caesars. Napoleon III. purchased these grounds in 1861 from the king of Naples for 250,000 francs, and spent 750,000 francs on the excavations alone, designed to aid in his work on Julius Caesar. In 1870 he sold them for 650,000 francs to the city authorities of Rome, on condition of their continuing the excavations under the direction of Pietro Rosa.
again visited California, and in 1864 published "Woman and her Era" (2 vols. 12mo, New York), a work on the position and rights of women. In 1865 appeared a posthumous work, "The Ideal Attained."

FARNHAM, Thomas Jefferson, an American traveller, husband of the preceding, born in Vermont in 1804, died in California in September, 1848. In 1889 he organized and headed a small expedition across the continent to Oregon. He went to California the same year, and took an active part in procuring the release of a large number of Americans and English who had been imprisoned by the Mexican government. In 1842 he published "Travels in Oregon Territory;" in 1845, "Travels in California and Scenes in the Pacific," and "A Memoir of the Northwest Boundary Line;" and in 1848, "Mexico, its Geography, People, and Institutions."

FARO, or Patoire, a game of chance at cards, said to derive its name from the figure of an Egyptian Pharaoh which was formerly placed on one of the cards. It may be played by any number of persons, who sit at a table generally covered with green cloth. The keeper of the table is called the banker. The player, called the punter (from Ital. puntare, to point), receives a livret or small book from which to choose his cards, upon which he may at his option set any number of stakes, which are limited in amount in accordance with the capital of the banker. The banker turns up the cards from a complete pack, one by one, laying them first to his right for the bank and then to his left for the player, till all the cards are dealt out. The first card is considered blank. The banker wins when the card equal in points to that on which the stake is set turns up on his right hand, but loses when it is dealt to the left. If any two of the cards are called a "turn." The player loses half the stake when his card comes out twice in the same turn. This is called a "split." The last card but one, the chance of which the banker claims, but which is now frequently given up, is called hooly (a certainty). The last card neither wins nor loses. Where a punter gains, he may either take his money or parole; that is to say, double his chance by venturing both his stake and gains, which he intimates by bending a corner of his card upward. If he wins again, he may play sept et le vo, which means that after having gained a parole he tries to win seven fold, bending his card a second time. Should he again be successful, he can parole for quinze et le vo, for trente et le vo, and finally for soixante et le vo, which is the highest chance in the game. Faro was formerly in vogue in France, England, and Europe generally, and still retains its popularity in various parts of the world.

The centre of the table is a suit of cards, called "the lay-out," arranged in the following order:

<table>
<thead>
<tr>
<th>King</th>
<th>Queen</th>
<th>Knave</th>
<th>10-spot</th>
<th>9-spot</th>
<th>8-spot</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ace</td>
<td>Duce</td>
<td>Trey</td>
<td>4-spot</td>
<td>3-spot</td>
<td>2-spot</td>
</tr>
</tbody>
</table>

The king, queen, and knave are called "the big figure," the ace, dence, and trey, "the little figure," and the 6, 7, and 8, "the pot." On these cards the player places the sums he wishes to bet. The dealer shuffles a pack of cards (the option of shuffling resting also with any of the players who call for it), has them cut, and then places them in a box, from which he deliberately slides them one by one. The first is called the sota card, and is set aside; the next is the banker's card, and wins for him all sums bet upon it; the next is the player's card, and so on alternately. It is in the power of the player, by placing a small copper on the amount he places on the card, to reverse the chance. This, which is called "coppering," enables the player to bet on or against whichever card he pleases. The dealer stops between each two cards while new bets are being made as checks change from one card to another, and thus the game proceeds to the close of the pack, when a fresh deal is made, and the process is repeated. The bank wins on "splits," which is supposed to be the only odds in its favor; but it possesses others in its superior amount of capital, and in the inclination of most players to stake heavier in the effort to recover than to support good luck. When but two cards are left in the box, the player has the privilege of "calling the last turn," that is, guessing in which order they will appear; if correct, he wins four times the amount of his stake. In Germany the cards are not dealt from a box, but nailed to a pine board and torn off one by one by the dealer. Here the dealer is generally assisted also by one or two croupiers, who attend to the playing and receiving, guarding against errors, and shuffling the pack.

FARO, a city of Portugal, capital of the province of Algarve, near the mouth of the Valfermoso, 62 m. E. of Cape St. Vincent, and 140 m. S. E. of Lisbon; pop. about 8,500. It was destroyed by the English in 1596, and by earthquakes in 1723 and 1755, and now presents a modern appearance, though, with the exception of the principal square and of a fortress, the houses are generally poor. The town has a cathedral, a theological seminary, and a mathematical school for the army. The cathedral, said to have been a mosque, is a time-worn building. In the E. and highest part of the city is an ancient and imposing castle surrounded by Moorish walls, and in the same direction is an arch with a statue of St. Thomas Aquinas. Blindness prevails to
a great extent, owing to the light sandy soil. Sand bars render the port, which is defended by a small citadel, almost inaccessible; but tolerable anchorage is obtained in the roadstead formed by three small islands at the mouth of the river. The coasting trade is active, especially in southern fruit. Figs and oranges are the most important products.

**FAROCHON, Jean Baptiste Eugène**, a French medallist and sculptor, born in Paris in 1807. He studied under David, early executed busts, small statues, and medallions, received a prize in 1833, studied in Italy as a pensioner of the academy, and on his return to Paris gained reputation by his medallions. Devoting himself to statuary, he produced in 1859 his masterpiece, "The Mother," which was again exhibited in 1867. Since 1868 he has been professor at the school of fine arts.

**FAROE, or Fló isles (Dan. Færøerne),** a group belonging to Denmark, in the Atlantic ocean, N. of Scotland, between lat. 61° 10' and 62° 26' N., and lon. 6° 10' and 7° 35' W.; area, 510 sq. m.; pop. in 1870, 9,992. They are 22 in number, 17 of the larger ones being inhabited. The largest of them are Strømø, the central island, 27 m. long and 7 m. broad, with about 2,600 inhabitants, and Osterø, 20 m. long and 10 m. broad, with a population of about 2,100. Next in size are Syderø, Sandø, and Vágø. The interior of the islands is generally hilly, the mountains varying in height from 1,000 to 2,800 ft. The valleys are narrow, and the rivulets flowing through them are so swollen during the rainy season as to render travelling impossible. The prevailing rocks are greenstone and claysone of various kinds. Some of the islands contain coal mines, and fine opal and traces of iron, copper, and other metals are found. The soil seldom exceeds a foot in depth, though in some places it is as deep as 6 ft.Beans, potatoes, and a few other vegetables flourish, but barley is the only cereal that matures, and even that often fails in consequence of the sudden changes of temperature. There is no timber; coal and turf are used for fuel. The pasture lands are luxuriant, and the wealth of the islanders consists chiefly in sheep, which yield a very fine wool. The horses are small, but hardy, active, and sure-footed. The cows are also small. Sea fowl valuable for their flesh and feathers abound on the coast. Ship building is carried on with success. There are cloth and stocking manufactories and a few tanneries. Fisheries of the whale, seal, cod, and herring, and the collecting of oider down, constitute a large part of the resources of the country. Bread and salt are luxuries. The population, descendants of the old Northmen, are vigorous and laborious; and of loyal and religious character. The common language is a dialect of the Norse, but the official language is Danish. The longest day of summer, including the long twilight, is 24 hours, and the shortest of winter 4 hours.—Monks from the Scottish isles first founded in the Faroe group a few hermitages.

In the 9th century fugitive Norwegian pirates established themselves under Grim Ramban. The islands became Danish when Norway was united with Denmark in 1880. During the 18th century they were notorious as the seat of smugglers. They were occupied by the English from 1807 to 1814. The administration is composed of a Danish admiral and bailiff, who is commander of the armed force, and a landdrojer, who is director of the police; and they are represented in the legislature of Denmark by a deputy appointed by the king. Commerce with the Faroe islands is a monopoly of government, and Danish ships are permitted to approach them only between May and September. Capital, Thorshavn, on the S.E. side of Strømø; pop. about 800.

**FARQUHAR, George,** a British comic dramatist, born in Londonderry, Ireland, in 1678, died in London in April, 1707. After a brief career at Trinity college, Dublin, he appeared in his 17th year as a comedian upon the Dublin stage. While performing in the "Indian Emperor" of Dryden, he accidentally inflicted a serious wound upon his antagonist in fencing, which caused him to renounce the boards for ever. He went to London in 1696, obtained a commission in the army, and applied himself to dramatic composition. He lived gayly and licentiously, and during the ten years before he sank a victim to anxiety and ill health he produced seven comedies, superior in vivacity and ease of style, and in clear and rapid development of intrigue, to any that had before appeared in England. The last and best of these was the "Beaux Stratagem" (1707), which still keeps the stage. He also left a volume of "Miscellanies," consisting of poems, essays, and letters. His works have much of the smartness and indecency fashionable in his time, but are written in better language and are less designedly vicious than the plays which preceded the revolution of 1688. He passed a troubled though merry life, and left two daughters in indigence, whom in a brief and touching note he recommended to the kindness of his friend the actor Wilks. A complete edition of his works appeared in 2 vols. 12mo in 1772.

**FARRAGUT, David Glassoe,** an American admiral, born at Campbell's station, near Knoxville, Tenn., July 5, 1801, died in Portsmouth, N. H., Aug. 14, 1870. He entered the navy as midshipman at the age of 11, and his first service was on board the famous Essex, in which he participated in the engagement that resulted in the capture of the British ship Alert, and also in the three hours' fight in the bay of Valparaiso, March 28, 1814, before the Essex surrendered to the Pehue and Chirub. In his report of the battle Commodore Porter commended "the lad Farragut," and regretted that he was too young for promotion. Under the same commodore Farragut took part in the attack on the rendezvous of pirates at Cape Cruz on the southern coast of Cuba in 1828.
The fight lasted 12 hours, and resulted in the defeat of the pirates and the destruction of their boats and village. From this time for nearly 40 years he was sailing about the world or quietly serving at naval stations, rising slowly by seniority. He was commissioned lieutenant in 1825, commander in 1841, and captain in 1855; and his most important command in all that time was that of the Mare Island navy yard, California, 1854-8. When the civil war began, Farragut was 60 years of age, and had been in the service more than 48 years. He was living at Norfolk, Va., "waiting orders," on the day when intelligence was received that Virginia had seceded. He hastily collected a few valuables, put his loaded pistols in his pocket, and within two hours was with his family on board a steamer bound north. Leaving his family at Hastings-on-the-Hudson, he reported to Washington, where he remained nine months in comparative inactivity. His first orders for active duty appointed him commander of the expedition for the capture of New Orleans and opening of the Mississippi river. These orders reached him Jan. 20, 1862, and in two weeks he was under way in his flagship the Hartford. On reaching the gulf of Mexico he first arranged the blockade of the whole coast, and then with the more formidable portion of his fleet entered the Mississippi. A mortar flotilla was attached to the expedition, but Farragut placed no reliance upon it. The bombardment of the forts a little above the mouths of the river was kept up continuously for six days and nights; but the enemy daily added to their defences, and beyond the burning of the barracks within Fort Jackson the works, mounting 120 guns, were as formidable as at the commencement of the bombardment.

Without further delay, Farragut in the night of April 24 signalled his squadron to get under way, and, delivering broadsides of grape, ran past the forts "under such a fire from them," he wrote, "as I imagine the world has never seen." Beyond the forts he encountered and destroyed a fleet of 30 armed steamers, 4 iron-clad rams (one of 4,000 tons), and a multitude of fire rafts. Next he silenced the two formidable Chalmette batteries, on either side of the river three miles below New Orleans, and at noon the second day anchored with the city beneath his guns. In the passage of the forts his fleet received 165 shots, 97 men were killed and 147 wounded, and one vessel, the Varuna, was sunk. Farragut next proceeded to Vicksburg (attacking Grand Gulf in passing), for the purpose of reducing that stronghold, and, running his vessels safely past the powerful batteries, communicated with the squadron brought down from the upper Mississippi; but notwithstanding all his exertions the attack failed from the lack of a cooperating land force. He then reloaded the batteries and withdrew his fleet to Pensacola for repairs. On July 11, on the recommendation of the president, he received the thanks of congress, and on the reorganization of the navy in the same month was placed first on the list of rear admirals. In the following autumn the capture of Corpus Christi, Sabine pass, and Galveston was effected by his squadron. In March, 1863, Farragut again advanced against Vicksburg, but encountered so tremendous a fire at Port Hudson that but two vessels, the Hartford and the Albatross, succeeded in passing the batteries. All the vessels of his squadron were terribly cut up, and the frigate Mississippi was destroyed. With his flag ship and her small consort he kept on to Vicksburg, and established communication with the upper Mississippi fleet and with the army under Gen. Grant. By this exploit he obtained control of the river between Port Hudson and Vicksburg, established a blockade of the Red river, and thus intercepted the supplies from Texas destined for the confederate armies. About the last of May he returned and engaged the batteries at Port Hudson, and from that time till July 9, when the garrison surrendered, he closely cooperated with the army in its investment of the place. The following summer Farragut summoned his squadron to the attack of Mobile, and on the morning of Aug. 5, 1864, conducted his force past Forts Morgan and Gaines guarding the entrance, and further on in the bay engaged and vanquished the confederate fleet of iron-clads, winning, after a desperate fight of several hours, a victory next in lustre and consequence only to that of New Orleans. In this battle, just as the iron-clad Tecumseh was opposite Fort Morgan, a torpedo was exploded under her, and in three minutes she had sunk, carrying down her commander, T. A. Craven, and more than 100 of her crew. The Brooklyn, the leading ship of the line, supposing it to have been the confederate ram Tennessee which had blown up, gave three hearty cheers, but, soon discovering the mistake, made signal to the admiral: "Our best monitor is sunk." Shortly afterward the Brooklyn discovered a nest of torpedoes close ahead, and stopped, to avoid running into them. Farragut, who had had himself lashed to the Hartford's rigging, seized upon this circumstance to dash forward and assume the head of the line; a position which he had reluctantly yielded to the Brooklyn at the earnest solicitation of his captains, who felt confident that the leading ship would be destroyed. Again congress expressed to Farragut the gratitude of the country, and created for him the grade of vice admiral, in which office he was confirmed Dec. 21, 1864; and on July 25, 1866, congress again created a higher office, that of admiral, and conferred it upon him. In 1867 Farragut sailed from Brooklyn in the frigate Franklin, and commanded the European squadron until 1868. Wherever he touched during that cruise he received most distinguished honors alike from sovereigns and people. While on a journey undertaken for the improvement of his failing health, he died at the Portsmouth navy yard.
A mural tablet in his honor was placed in the church of the Incarnation, New York, Nov. 10, 1873.—See his "Life and Naval Career," by P. C. Headley (New York, 1865), and his "Life," by his son Loyall Farragut (1879).

FARRAR, Frederick W. See supplement.

FARRAR. I. Johns, an American mathematician, born in Lincoln, Mass., July 1, 1779, died in Cambridge, May 8, 1833. He graduated at Harvard college in 1803, and studied divinity at Andover, but accepted the appointment of Greek tutor at Harvard in 1805. In 1807 he was chosen Hollis professor of mathematics and natural philosophy. In 1818 he published for the use of his pupils a translation of Lacroix's "Elements of Algebra," followed by selections from Legendre, Biot, Bézout, and others. These works were at once adopted as text books by Harvard college, and by the United States military academy. He also contributed to the scientific periodicals, to the "North American Review," and to the "Memoranda" of the American academy. In 1836 he resigned his chair in consequence of a painful illness which eventually caused his death. II. Eliza Betch, an American authoress, second wife of the preceding, born at New Bedford, Mass., in 1792, died at Springfield, April 22, 1870. She married Prof. Farrar in 1828. Among her earliest publications are "The Children's Robinson Crusoe," "Life of Lafayette," "Howard," and "Youth's Letter Writer." Her most popular work, "Young Lady's Friend" (1837), passed through many editions in the United States and in England. In 1865 she published "Recollections of Seventy Years."

FARREN, Eliza, countess of Derby, an English actress, born in Liverpool in 1759, died April 28, 1829. Her father, a native of Cork, who was successively a surgeon, an apothecary, and an actor, left his family in great indigence. Eliza made her début in Liverpool in 1773, and in London in 1777, where she played successively at the Haymarket, Covent Garden, and Drury Lane. Although a very graceful and lively actress, she owed her reputation chiefly to her remarkable beauty, which received the homage of the most illustrious men of the time. She was esteemed as much for her virtues as her beauty, and on May 1, 1797, became the wife of the 12th earl of Derby, then a widower.

FARS, or Farsistan (Pers., land of the Persians; anc. Persia), a S. W. province of Persia, bounded N. W. by Khuzeistan, N. by Irak-Ajemi and Kohrosan, E. by Kerman, S. by Laristan and the Persian gulf, and W. by the Persian gulf; area estimated at about 80,000 sq. m.; pop. between 1,000,000 and 1,500,000, including Turkomans, Banians, and a small number of Jews. It is divided into the Germ-e, the Shiraz, or desert province, and the plains province. The former extends inland from the coast, its surface being a sandy plain, wholly dependent for vegetation on the periodical rains. The latter comprises the more elevated region belonging to the great range of mountains which extend from the Caucasus to the gulf, and which in this part are exceedingly steep toward the sea. This portion of the province consists of fertile valleys. A few of them, as Shiraz, Kazern, and Mirdasht, are cultivated, but many are wooded and uninhabited. The southern part of the coast E. of Ras Berdistan is occupied by Arabs, who acknowledge the authority of the sultan of Muscat, and in the northern districts there are some tribes of Kurds. Eastward the country is more open, sandy, and ill supplied with water. The chief rivers are the Sitaregan, flowing into the Persian gulf, and the Benemir, falling into the salt lake Bakhtegan. Another salt lake, near Shiraz, supplies the province with salt. The general products of the country are tobacco in large quantity, wine, rice, dates, opium, linen, cotton, silk, cochineal, and roses for the manufacture of attar. Iron and lead mines exist, as also quarries of marble and alabaster. Borax and naphtha are among the chemical products. Attention is given to the raising of horses, camels, and asses, for export. The inhabitants of this province are considered the most industrious in Persia. They manufacture woolen, silk, and cotton stuffs, and carry on an extensive trade with India. The government is vested in a prince of the sovereign's family, under whom are the governors of districts. There are many interesting remains of antiquity. The tomb of Cyrus is at Murgab, the ancient Pasargada; the ruins of Persepolis are between that town and Shiraz. Inoculation is said to have been known among the tribes of Fars for centuries. Among the principal towns are Shiraz, the capital; Kazern, with excellent opium produced in the vicinity; Darab or Dara, famous for its date trees; and Bushire, the chief port in the Persian gulf. (See PZxms.)

FARTHINGALE (Fr. tertugadine, h. gardin, Fr. tertugad, guardian of virtue), a petticoat spread to a wide circumference by hoops of willow, whalebone, or iron, introduced into England under this name in the reign of Elizab. In the reign of Anne it was called a tub petticoat. It appeared in France early in the reign of Louis XV. under the name of tertugadin and pantier, or basket petticoat, its greatest diameter being made equal to the height of the lady. Its abandonment was effected near the close of the same reign by Mlle. Clai, who appeared on the stage without it; but it again became fashionable under Marie Antoinette. In England the hoop, the successor of the farthingale, went out of fashion in the reign of George IV., who forbade it at court.

FAST (Sax. festan, to keep), abstinence from food, especially as a religious observance; applied also to the period of such abstinence. Festing is a very old religious custom, known to history, with the single exception of that of Zoroaster. It appears to have been also in use among the semi-civilized and savage tribes in both hemispheres. The Mohomme
dans observe strictly the fast of the month of
FASTI, abstinence from all food daily from sunrise until sunset. On the Hebrews the law of Moses enjoined one annual fast on the day of atonement; others were observed by the nation in course of time in memory of great calamities. The modern Hebrews observe six fasts of obligation; the most fervent keep many more. The fast consists in abstaining from all food and drink from sunrise till nightfall, the fast of atonement alone from sunset until nightfall the next day. Both the eastern and western churches from the earliest times observed the Lenten fast of 40 days in memory of Christ's fasting. The Greek church enjoins fasts on all Wednesdays and Fridays, on the 40 days before Christmas, and the 40 days before Easter, the period extending from the week after Pentecost until June 29, and from Aug. 1 to Aug. 14, besides numerous other fasts as a preparation to ecclesiastical festivals; in all 180 fast days in the year. There is a legal distinction made by both the Latin and eastern churches between "fasting," which implies the refraining from all food, and "abstinence," which is the refraining from flesh meat, eggs, milk, butter, and cheese. Thus, Roman Catholics abstain from flesh meat on all Fridays except Christmas day, and on the rogation days, or three days before Ascension Thursday. The fasts universally observed in the Catholic church are those of Lent, of the ember days, and of the vigils of Christmas, Pentecost, the Assumption (Aug. 15), and All Saints (Nov. 1).—Protestants generally admit the utility of fasting, while denying its necessity. They do not admit the legal distinction between fasting and abstinence. The English church and the Protestant Episcopal church of America maintain their ecclesiastical calendar, under the name of fasts, both the "days of abstinence" and the "fast days" of the Catholic church. The Presbyterian church in the United States follows the doctrine of the Westminster Confession, that "solemn fastings" are "in their times and seasons" to be used in a holy and religious manner. The Methodist Episcopal church enjoins fasting or abstinence on the people, and advises weekly fasts to be kept by her clergy. The New England Puritans, while rejecting ecclesiastical fasts, observed themselves "seasons of fasting and prayer," and admitted both the right and duty of the civil ruler to set apart days for such purpose. In New England it is still customary for the governors of states to appoint in the spring "a day of fasting, humiliation, and prayer," which is generally observed in the churches. During the civil war the president of the United States recommended by proclamation such days to be observed by the nation.

FASTI, in Roman antiquity, registers of the days on which the civil divisions of the year correspond to modern calendars. The term is variously derived from fas, divine law, and fori, to speak, as it properly designated those days of the year on which legal business could without impolicy be transacted, or legal judgment be given by the magistrates. The fasti calendares or sacri, the chief division of these registers, contained the enumeration of all the days, divided into months and weeks of eight days according to the mundina (the days of each of the latter being designated by the first eight letters of the alphabet), the calends, none, and ides. Days on which legal business could be transacted were marked by F. as fasti; those from which judicial transactions were excluded by N. as nefasti; the days on which justice could only be administered at certain hours were called ex parte fasti, also interici, and were marked in the calendar, when justice could be demanded during the early part of the day, by F. P. fasto primo; and days on which the assemblies of the comitia were held by C. Primarily these registers are said to have been intrusted by Numa as sacred books to the care of the pontifex maxinus, and for nearly four centuries the knowledge of the calendar continued to be in exclusive possession of the priests, one of whom regularly announced the new moon, and the period intervening between the calends and the nones. On the nones the rex sacrorum proclaimed the various festivals to be observed in the course of the month, and the days on which they would fall. This knowledge, previously jealously kept to themselves by the priests and patricians, was first made public in 304 B. C. by Cneius Flavius, by some believed to have been a scribe to Claudius Cemenus. Besides the above mentioned divisions of time, with their notation, they generally contained the enumeration of festivals and games, which were fixed on certain days, astronomical observations on the rising and setting of the stars and on the seasons, and sometimes brief notices about religious rites, as well as of remarkable events. In later times flattering inserted the exploits and honors of the rulers of Rome and their families. The rural fasti (rustici, distinguished from the urbani) also contained several directions for rustic labors to be performed each month. A different kind of fasti were those called annales or historici, also magistrales or consularia, a sort of chronicles, containing the names of the chief magistrates for each year, and short accounts of remarkable events noted opposite to the days on which they occurred. Hence the meaning of historical records in general attached to the term fasti in poets, while it is used in prose writers of the registers of consuls, dictators, censors, and other magistrates, belonging to the public archives. Several specimens of fasti of different kinds have been discovered in the last three centuries, none of which, however, are older than the age of Augustus. The Fasti Maffiani, the complete catalogue of which contains the long Maffei palace at Rome, but finally disappeared, are now known by a copy prepared by Pighius; the Verriani, known as the Prenestine calendar, comprising only five months, are histor-
tically no less remarkable. The latter appear to have contained ample information about festivals, and details of the honors bestowed upon and the triumphs achieved by Caesar, Octavianus, and Tiberius. A most remarkable specimen of the second class was discovered in 1548 in the Forum Romanum, in large fragments, giving the list of consuls from the 250th to the 785th year of Rome, and is known under the name of Fasti Capitolini. New fragments were found in 1817 and in 1818. Originally they contained the records of Rome from the expulsion of the kings to the death of Augustus. Labbe has given Fasti consulares out of a MS. of the college of Clermont in his Bibliotheca Nova. Several modern writers, as Sigonius, Reland, and Baiter, have published chronological tables of Roman magistrates under the title of Fasti.

FAUCHER

See supplement.

FAT. See ADIPSE SUBSTANCES, ALIMENT, and EXPULSION.

FATA MORGANA, or castles of the fairy Morgana, a mirage occasionally seen from eminences on the Calabrian shore, looking westward upon the strand of Messina. It occurs in still mornings, when the waters are unruffled by breeze or current, and the sun, rising above the mountains of Calabria, strikes down upon the smooth surface at an angle of 45°. The heat then acts rapidly upon the stagnant air, the strata of which, but slowly intermixing, present a series of mirrors which variously reflect the objects upon the surface. The tides must have operated to raise the surface into a convex form, as sometimes occurs at this locality. Objects on the Sicilian shore opposite, beneath the dark background of the mountains of Messina, are refracted and reflected upon the water in mid channel, presenting enlarged and duplicated images. Gigantic figures of men and horses move over the picture, as similar images in miniature are seen flitting across the white sheet of the camera obscura. Sometimes the sky above the water is so impregnated with vapor that it surrounds these objects with a colored hue. The wonderful exhibition is but of short duration. The phenomenon is not peculiar to this locality, though the configuration of the coast and the meteorological conditions of the region concur to render its exhibition more frequent and more beautiful here than elsewhere.

FATES. See PARCE.

FATIMITES, or Fatimides, the descendants of Fatima, the daughter of Mohammed, a powerful Arab dynasty which for two centuries ruled Egypt and Syria, while the Abbasside caliphs reigned at Bagdad. They claimed as their founder Ismael, the 6th of the 12 imams who were descended from Ali and Fatima; but this claim was disputed, and they were variously said to have first appeared in Persia, in Egypt, and at Fez, and to have been descendants of a Jew, a locksmith, and an eastern saxe. They first attained to empire under Abu Obeidallah, who in A.D. 909 announced himself in Syria as the mahdi, or director of the faithful, foretold by the Koran, and expected as the Messiah by a class of heterodox Musalmans. Denounced by the caliph, he fled to Egypt, was imprisoned for a time in North Africa, but was afterward recognized as a messenger from heaven, and made himself caliph of the whole country from the straits of Gibraltar to the border of Egypt. His successor conquered the island of Sicily. Moez, the 4th caliph, wrested Egypt from the Abbassides in 970, founded Cairo, fixing his residence in its present suburb of Fostat, and conquered Palestine and a large part of Syria. Aziz, his successor (975–996), consolidated and extended his conquests, and embellished Cairo with many monuments. His son Hakem (996–1021) was preeminently distinguished for fanaticism and cruelty, persecuting alike Christians, Jews, and orthodox Mohammedans. Declaring himself a manifestation of God, he became near the close of his reign the founder of a new religion, now represented by the Druses of Syria, who expect his reappearance as their Messiah. From his time the power of the Fatimites declined. On the death of Ashd, the 14th caliph, in 1171, the dynasty was extinguished, and a new one established by Saladin. (See CAILPH.)

FAUCHER, Hippolyte, a French orientalist, born at Angouleme in 1797, died at Jully, department of Seine-et-Marne, in 1869. His fortune enabled him to devote his whole life to Hindoo literature, and he translated into French many celebrated Sanskrit poems and other works. His labors were rewarded by two academical prizes. His most extensive translations are the Ramayana (9 vols., 1854–8) and the Mahabharata (7 vols., 1868–77), which latter was interrupted by his death. He also published poetry and a novel.

FAUCHER, Leon, a French political economist, born in Limoges, Sept. 8, 1803, died in Marseilles, Dec. 14, 1854. When a boy he supported himself and his mother by making designs for embroidery, and afterward became a teacher in Paris. After the revolution of 1830 he was successively editor of the Temps, the Constitutionnel, and the Courrier Français. He was chosen to the chamber of deputies for Rheims in 1846, and, joining the opposition party, was prominent in the debates on questions touching political economy. He was elected by the department of Marne to the constituent assembly of 1848. In December of that year, and again in April, 1861, he was appointed by Louis Napoleon minister of the interior, serving each time but a few months. He was instrumental in preparing the law of May 31, 1860, restricting the limits of suffrage; but he declined to accept office under Louis Napoleon after the coup d'état. He now devoted himself chiefly to the interests of the crédit foncier, having previously become known by his advocacy of a gradual reduction of duties, and of a commercial league between France, Belgium, Spain, and Switzerland, as a coun-
terpoise to the German Zollverein. Among his remarkable earlier efforts were an essay in the Revue des Deux Mondes on the relations of property in France, and a pamphlet in 1838 on prison reform. His principal work, Études sur l'Angleterre, a description of the social, industrial, and political institutions of England, appeared in 1846.

FAULK, a S.E. central county of Dakota territory, recently formed, and not included in the census of 1870; area, about 900 sq. m. It is drained by the North fork of Dakota or James river, and consists largely of table land.

FAUNS, in Roman mythology, rural divinities, descended from Fauna, king of Latium, who introduced into that country the worship of the gods and the labors of agriculture. The poets ascribed to them horns, and the figure of a goat below their waist, but made them gayer and less hideous than the satyrs. Fauna, like satyrs, were introduced upon the ancient stage in comic scenes. The cabalistic mythology also admits the existence of fauns, whom it regards as imperfect creatures. It supposes that God had created their souls, but, surprised by the sabbath, had not time to finish their bodies. Hence these unfinished beings seek to sham the sabbath, on which day they retire to the deepest solitudes of the forests.

FAUNTLEROY, Henry, an English forger, born in London about 1784, executed there, Nov. 30, 1824. He early joined the London banking house of Marsh, Stracey, and co.; and about 1814 began a system of forgeries involving about £40,000, though the bank of England prosecuted him only for £170,000. Among his papers was a most business-like statement, drawn up by his own hand as a private memorandum, containing a list of transactions to the amount of £120,000, with the names of the persons whom he had defrauded by selling the stocks they had deposited with him, through forged powers of attorney; and the conclusive plainness of this statement led to his conviction. The interval of ten years between the beginning and the detection of his crime has been ascribed to his presumed integrity, and to the fact of his forgeries having been committed upon funded property and not upon bills of exchange, including an amount of £300,000 that belonged to his own wards, which he drew by means of forged documents. Besides, he had no accomplices, and all the transactions were confined to England, and chiefly to London. Fauntleroy was the last forger hanged in England, capital punishment for forgery having been finally abolished in 1822.

FAQUIER, a N.E. county of Virginia, bounded N. W. by the Blue Ridge, and S. W. by the Rappahannock river and one of its branches; area, 680 sq. m.; pop. in 1870, 19,960, of whom 7,856 were colored. It has a diversified surface, a productive soil, and is rich in minerals. There are several gold mines which have been worked with profit, and beds of magnesia and mica stone have been discovered. It is traversed by the Orange, Alexandria, and Manassas railroad and branches. The chief productions in 1870 were 269,952 bushels of wheat, 924,947 of Indian corn, 180,591 of oats, 37,010 of potatoes, 6,611 tons of hay, 194,988 lbs. of butter, and 38,493 of wool. There were 5,811 horses, 5,825 milk cows, 15,208 other cattle, 12,127 sheep, and 14,259 swine; 19 flour and 2 saw mills, 8 tanneries, and 5 currying establishments. Capital, Warrenton.

FAURE, Jean Baptiste, a French vocalist, born at Moulins, Jan. 15, 1830. He first appeared at the Opéra Comique in 1852, and in 1857 became professor at the conservatory, where he had been educated. In 1861 he made his first appearance at the Grand Opéra, and he has since acquired great reputation as a baritone singer, his voice being both powerful and sweet. He is most admired in Mozart's Don Juan, Meyerbeer's Africaine, Thomas's Hamlet, and as Mephistopheles in Gounod's Faust, in which he excels as a basso. He married in 1860 Constance Caroline Lepesvre, born in Paris, Dec. 21, 1828. Having at an early age become acquainted with Aubier, she was induced by him to cultivate her voice at the conservatory, where she gained a prize in 1842. She first performed at the Opéra Comique in 1852, gradually rising to distinction by her pleasant and well trained voice and sprightly acting. Her best parts were in the Val d'Andorre, the Étoile du Nord, and kindred operas. In 1868 she performed in Mendelssohn's liébeth at the Théâtre Lyrique, but has since retired from the stage.

FAURIEL, Claude Charles, a French historian and critic, born in St. Étienne, Oct. 21, 1772, died in Paris, July 15, 1844. After receiving a good education he entered the army in 1796, served under La Tour d'Auvergne, and became secretary to Gen. Dugommier; but after a year's service he returned to St. Étienne, where he received a civil appointment. Subsequently he was private secretary to Fouche, minister of police, but resigned in 1802 when he saw Napoleon about to be made consul for life. He had in the mean while contracted literary tastes and friendships. He studied Arabic with De Sacy, and was one of the first Europeans to learn Sanskrit; gathered a multitude of facts as to the less known tongues, as the Basque, Gallic, and Old German; wrote translations from the Danish poet Baggesen, and the Italian poets Manzoni and Berchet; collected materials for a history of stoicism, which he never finished; and translated many Greek songs. From 1824 to 1826 he resided in Italy, studying oriental languages, and soon afterward founded, in connection with other orientalists, the Asiatic society. In 1880 he was appointed professor of foreign literature in the faculty of letters at Paris. This chair, which was created for him by the duke de Broglie, he filled for nearly 15 years, lecturing on comparative philology, the origin of the French and Italian languages, ancient and medieval poetry,
and the drama. His principal works are: Chants populaires de la Grèce moderne, with translations and notes (1824-5); Histoire de la Gaulle méridionale sous la domination des conquérants germains (4 vols., 1836); Histoire de la croisade contre les héritiques albigeois, translated from the Provençal verse of a contemporary (1837); Histoire de la poésie provençale (8 vols., 1848); and Dante et les origines de la langue et de la littérature italiennes (3 vols., 1854); besides some literary collections, and important articles in the Revue des Deux Mondes (1829-48), and in the Bibliothèque de l'École des Chartes. A portion of the "History of Provençal Poetry" was translated into English by G. J. Adler (New York, 1880).

FAUST, or Faustus, Dr. Johann, a prominent character of the national and popular poetry of Germany. According to tradition, he was a celebrated necromancer, born about 1480 at Knittlingen in Württemberg, or, as others have it, at Roža, near Weimar, or Anhalt. He is said to have studied magic at Cracow. Having mastered all the secret sciences, and being dissatisfied at the shallowness of human knowledge, he made an agreement with the Evil One, according to which the devil was to serve Faust for full 24 years, after which Faust's soul was to be delivered to eternal damnation. The contract, signed by Faust with his own blood, contained the following conditions: "1, he shall renounce God and all celestial hosts; 2, he shall be an enemy of all mankind; 3, he shall not obey priests; 4, he shall not go to church nor partake of the holy sacraments; 5, he shall hate and shun wedlock." Faust having signed these conditions, Satan sent him as a familiar spirit Mephistopheles, a devil "who likes to live among men." Faust now began a brilliant worldly career. He revelled in all manner of sensual enjoyment, of which his attentive devil servant, with an inexhaustible fertility of imagination, was always inventing new and more attractive forms. When remorse tormented Faust and surfeited him to sober reflection, Mephistopheles diverted him with all kinds of curious diversions. Disgusted at last with his life of dissipation, Faust yearned for marriage; but Satan appeared in all the terrors of fire and brimstone, frightened him out of this purpose, and then sent him from the lower regions the beautiful Greek Helen, as a concubine, who bore him a son, Justus Faustus. As the term of 24 years draws to its close, he seeks relief and salvation from priests, but nothing avails him. All flee from the doomed man. Midnight approaches; an unearthly noise is heard from Faust's room, the howling of a storm which shakes the house to its very foundation, demoniacal laughter, cries of pain and anguish, a piercing, heart rending call for help, followed by the stillness of death. Next morning they find Faust's room empty, but on the floor and walls evidence of a violent struggle, pools of blood and shattered brains; the corpse, mangled in a most horrible manner, they find upon a dunghill. The beautiful Helena and her son have disappeared for ever.—That some such person as Faust has existed is asserted in the most direct manner by writers who profess to have conversed with him. Among these eye witnesses are Philip Melanchthon, the great reformer, and Conrad Gesner; and even in Luther's "Table Talk" mention is made of Dr. Faustus as a man irretrievably lost. But it is not certain that the real name of this man was Faust. Joseph Görres maintains that a certain George Sabellius is the only historical person in whom the original of Faust can be recognized. Faust's death is presumed to have taken place in 1588. Tradition has connected with his name a great number of biographical traits and magical feats formerly ascribed to other reputed conjurers. The tragic fate of Faust is represented as resulting from an irreconcilable conflict of faith and knowledge. Goethe, in his grand drama, has attempted a poetical solution of the legend. The moral of his Faust is, that man's longing after knowledge may lead him into extraordinary errors and failings, but cannot destroy his better nature. —The first printed biography of Faust appeared in 1587, at Frankfort: Historia von D. Johann Fausten, den weltbeschremten Zauberer und Schwärzkünstler. In 1588 appeared a rhythmized edition and a translation into low German; in 1689, a translation into French, Histoire prodigieuse et lamentable de Jean Faust; about the same time an English version, "A Ballad of the Life and Death of Doctor Faustus, the great Conjurer;" and shortly after, "The History of the Damnable Life and Deserved Death of Dr. John Faustus." The latter version seems to have been the basis of Christopher Marlowe's drama, "Life and Death of Dr. Faustus," which in its turn was transformed into a German puppet play, from which Goethe drew the first conception of his tragedy. In 1599 G. R. Widmann published Wahrhaftige Historien von den gewöhnlichen und abscheulichen Sünden und Lastern, auch von vielen wunderbaren und seltsamen abenteuern so D. Johannes Faustus hat getrieben (3 vols., Hamburg). A new version appeared in 1674, which was often republished, but replaced at last by an abridged edition of Widmann's work (1728). A great number of books on necromancy also pretend to give, from original manuscripts of Faust, his cabalistic formulas, charms, talismans, &c. All of these publications, and also all important monographs bearing upon this subject, have been reprinted in the valuable collection of J. Scheible, Kloster weisselich und geistlich (Stuttgart, 1847). More than 250 different works on the legend of Faust are enumerated in Peter's Literatur der Faustsage (2 vols., Halle, 1849).

FAUST, or Fust, Johannes, an associate of Gutenberg and Schöffer in the first development of the art of printing, born in Münster, died in Paris about 1466. He was a wealthy gold-
FAVART, Jean Baptiste, a French painter, born in Bordeaux in 1822. He is a disciple of Meissonier's style of genre painting. His earliest pictures, "A Young Man Reading" (1845), "The Two Roses," and "The Concert" (1847), were succeeded in 1848-9 by "Nonchalance" and "The Carver." The government purchased in 1885 his "Two Musicians" for the Luxembourg. Among his later paintings is "The Prodigal Son" (1869).

FAVARA, a town of Sicily, in the province and 8 m. S. E. of the city of Girgenti, on an eminence; pop. about 13,500. It has a beautiful castle, built in the 14th century, and in the neighborhood are many sulphur pits.

FAVART, Marie Justine (Beaute), a French actress, born in Avignon in 1727, died in 1772. She was a daughter of M. du Ronceray, a musician, and first appeared as a vocalist at the Opéra Comique, Paris, in 1744, under the name of Mlle. de Chantilly. Next year she married the dramatist and inventor of the vaudeville, Charles Simon Favart, who, by following soon after the camp of Marshal Saxe with a dramatic troupe, subjected himself and his wife to severe persecutions on account of her rejecting the marshal's addresses. After the marshal's death in 1750 she resumed acting in Paris, chiefly in her husband's plays. She excelled equally as actress, singer, and dancer, and introduced many excellent innovations in costume and other accessories. The plays of her husband, who survived her for ten years, fill 10 volumes, and some of her own are included in Œuvres choisies de M. et Mme. Favart (Paris,
1860.—Their son, Charles Nicolas Joseph Justin (1749–1800), became also an actor and playwright.

FAVART, Pierre-François, popularly known as Marie Favart, a French actress, born at Beaune, Feb. 16, 1833. Her family name was Pingaud, but she assumed the name of M. Favart, who adopted her as a daughter. She was educated at the conservatory, and became a most popular actress and a member of the Théâtre Francais. She belongs to the classical school, and is singularly elegant and impressive in her appearance and most exquisite in her elocution. She was greatly admired in 1864 as Esther, and among her most brilliant impersonations is Dora Sol in Hernani.

FAVRE, or Faversham, a market town, borough, and parish of Kent, England, and a member of the cinque port of Dover, on a branch of the Swale, 46 m. E.S.E. of London; pop. in 1871, 7,139. It contains a handsome church, several chapels, schools, and assembly rooms, a theatre, and the remains of an abbey founded by King Stephen. The town has long been famous for the manufacture of gunpowder, and has also some factories of Roman cement. Its chief trade is in oysters. It is accessible to vessels of 160 tons.

FAVIGNANA (anc. Egina or Athus), an important Roman naval station, an island of the Aegadian group in the Mediterranean, 8 m. from the N.W. coast of Sicily; pop. 4,000. It is about 5 m. long and from 2 to 3 m. broad. The surface is low, with the exception of a range of hills running through the centre, on the culminating summit of which is the castle of Santa Catarina. There is a good harbor on the E. side, on which stand the town and fortress of San Leonardo. San Giacomo, the principal place, is on the N. coast. The island produces good wine and fruits, and has several quarries and extensive tunny and anchovy fisheries, in the produce of which, and in sheep, goats, poultry, &c., it has a flourishing export trade.

FAVOTES, a family of fossil corals belonging to the hydroid scalepens. Their cells are divided by horizontal partitions, like those of the millepores, which, according to Agassiz, are true scalepens; but the species are so polyp-like that until recently they were classed with the polypa. According to Dana, they are a comprehensive type, intermediate between the polypa and the higher scalepens, and having some of the characters of both. They are all palæozoic, especially Devonian and upper Silurian.

FAVRIAS, Thomas Mahi, marquis de, a French conspirator, born in Blois in 1745, hanged in Paris, Feb. 19, 1790. Having entered the army and served in several campaigns, he was made first lieutenant in the Swiss guard of the count de Provence (afterward Louis XVIII.), and in 1792 commanded a legion in Holland during the insurrection against the stadtholder. In December, 1789, he was apprehended as the ringleader of a plot to introduce an army of 80,000 men, Swiss and Germans, into Paris by night, which was to murder Bailly, Lafayette, and Necker, and to carry off the royal family and the seals of state to Péronne. He was supposed to be a secret agent of the highest personages, and suspicion was directed to the count de Provence, who exculpated himself by a speech at the hôtel de ville. Favrías was summoned before the Châtelet, where he defended himself with great calmness. His witnesses were refused a hearing, and the whole trial was conducted in the most irregular manner. The populace shouted "Favrías to the lamp post," and he was condemned to be hanged. He met his fate with unshaken fortitude. When told that no resolutions would save his own life, he answered, "Then my secret shall die with me." His execution took place at night, by the light of torches, amid the jeers of the crowd.

FAVRE, Jules Claudé Gabriél, a French statesman and advocate, born in Lyons, March 21, 1809. His ancestors came from Piedmont, and his father was a merchant. He studied law in Paris, early acquired eminence by defending (1844–5) persons implicated in socialistic and revolutionary proceedings, and after the revolution of Feb. 24, 1848, was successively chief secretary in the ministry of the interior, member of the constituent assembly, and under-secretary for foreign affairs. Elected to the legislative assembly, he was one of the leaders of the opposition during the presidency of Louis Napoleon, and after the coup d'état of Dec. 2, 1851, declined to recognize the new constitution. Defeated as a candidate for the corps législatif in Lyons in 1867, he was returned in 1868 by a district of Paris, and won additional fame by his brilliant though unavailing defence of Orsini, who had attempted to assassinate the emperor. He was the most eloquent of the five so-called irreconcilable opponents of the second empire. Being chosen in 1868 as representative both in Paris and Lyons, he took his seat for the latter city, and made powerful speeches against the Mexican expedition and against the imperial policy in regard to the Roman question, and denounced the convention of Gastein as favoring the unity of Germany at the expense of France. Though persevering in his hostility to Napoleon III., he was defeated by the socialist Rapail at the election of 1869, and only secured his re-election in Paris, where he was opposed by Rochefort and Cantagrel, by the latter's withdrawal. His vehement opposition to the policy of the emperor, continued during the Ollivier ministry and the plébiscite movement in the earlier part of 1870, contributed much to increase public excitement; and he also joined Thierry in con-

FAWKEs 99

denning the warlike preparations against Prus-
sia, which ended in the declaration of war on
July 19. But from the moment he saw the
country irretrievably committed to the contest,
he accepted the situation and insisted upon im-
imediately arming the national guard. In the
session of the corps législatif held the day
after the surrender of Sedan, Favre denounced
Napoleon and his régime as responsible for
the national disasters, and the next day (Sept.
4) urged his deposition and that of his dynasty,
and proposed the appointment of an executive
committee for resisting to the last the invasion
of French territory. The republic being pro-
claimed, he became vice president of the prov-
isonal government of national defence, and
minister of foreign affairs. In his diplomatie
practical he declared that France would not
eed an inch of her soil nor a stone of her
fortresses, and held Prussia responsible for the
continuation of the war, since the ruler who
had begun it was supplanted by a new gov-
ernment which had nothing to do with the
opening of hostilities. He met Bismarck at
the castle of Ferrières, Sept. 19, and under-
took to pay any amount of indemnity, but re-
jected any cession of territory as humiliating
and dishonorable. The conditions imposed by
Bismarck in a subsequent interview for an ar-
mitice pending the elections were not accept-
ed. A state paper issued by Favre on the sub-
ject of these negotiations led to a counter-
statement from Bismarck, Sept. 27, and the
war went on. In October, after Gambetta's
departure for Toulon, Favre became ad interim
minister of the interior, and attempted to put
down the seditious movements in the besieged
capital. On Oct. 31 he shared the captivity of
Gen. Trochu in the invasion of the hôtel de
ville. After the conclusion of a three weeks'
truce with the Germans on Jan. 28, he in-
sisted upon respecting it, and Gambetta's con-
trary decrees were declared null and void.
Favre was sent to Prague to discuss the aff airs
after the election of Thiers as prov-
issional president in February, 1871, and he
gave to Frankfort with the minister of finance,
Pouyer-Quertier, to sign with Bismarck the
definitive treaty of peace (May 10). He re-
signed his post at the end of July, the ostensi-
sible cause being his disagreement with Thiers
and the majority of the assembly in regard to
the petitions in favor of the restoration of
the temporal power of the pope; but the in-
creasing influence of the conservative party
had rendered his position untenable for some
time, although his personal relations with Thiers
never ceased to be cordial. His reputed wife
had died June 12, 1870; and one Laluyé hav-
ing asserted that she had been only his mis-
tress, Favre prosecuted him and others for de-
famation, and though Laluyé was convicted and
imprisoned for one year, the mortifying pub-
llicity given to the affair confirmed him in his
desire to withdraw from politics for a time,
and devote himself exclusively to the law. He
has published Rome et la république française
(Paris, 1871), and Le gouvernement du 4 sep-
tembre (3 vols., 1871—2), which have been trans-
lated into English.

FAWCErr, Henry, an English political writer
and statesman, born in Salisbury in 1838. He
graduated at Trinity hall, Cambridge, in 1858,
and was elected a fellow in the same year. In
1857 he unsuccessfully contested Southwark, on
liberal principles, for parliament. In Septem-
ber, 1858, while out shooting, he met with an
accident by which he lost the sight of both eyes;
but he nevertheless became an extensive con-
tributor to the reviews of articles on political
science and economy, and has published sev-
eral works, among which are "A Manual of Po-
etical Economy" (1868) and "The Economic
Position of the British Laborer" (1866). He
contested the borough of Cambridge unsuc-
cessfully in 1868, and in 1868 was elected professor
of political economy in the university of Cam-
bridge. In 1864 he ran for Brighton, and was
again defeated, but was returned for that place
in 1865, and relected in 1868. In parliament
he has distinguished himself as an advocate
of republican principles, in conjunction with
Sir Charles Dilke and Auberon Herbert. In
1889 he published a revised edition of his
"Manual of Political Economy," with two new
chapters on "National Education" and "The
Poor Laws and their Influence on Pauperism,"
and in 1871 a work entitled "Panemism, its
Causes and Remedies." A collection of his
"Speeches" was published in 1878.—Prof.
Fawcett was married, April 28, 1887, to Millicent
Garrett, who published in 1879 a "Political
Economy for Beginners;" and in 1879 appeared
a joint work entitled "Essays and Lectures, by
Henry and Millicent Garrett Fawcett."

FAWKEs, Guy, an English conspirator, born
in Yorkshire, executed in London, Jan. 80,
1606. He was a soldier of fortune in the Span-
ish army in the Netherlands, when in 1604 the
scheme of blowing up the parliament house,
with the king, lords, and commons, was con-
ceived by Robert Catesby, in revenge for the
penal laws against Roman Catholics. Fawkes
was admitted into the conspiracy, and returned
to England in May of that year. Thomas
Percy, one of the confederates, rented a house
adjoining that in which parliament was to as-
ssemble, of which Fawkes, who was unknown
in London, took possession as his servant, un-
der the assumed name of Johnson. Parliament
was soon after adjourned till Feb. 7, 1605, and
on Dec. 11 preceding the conspirators met in
the hired house of Percy, and began to exca-
vate a mine. Seven men were thus occupied
until Christmas eve, never appearing in the
upper part of the house, while Fawkes kept
constant watch above. Parliament was again
prorogued from Feb. 7 to Oct. 29, and the con-
spirators therefore dispersed for a time, but
completed their arrangements between Febru-
ary and May. They hired a vault immedi-
ately below the house of lords, which had
just been vacated by a dealer in coal, into which they conveyed by night 88 barrels of powder, and covered them with fagots. They again dispersed, Fawkes proceeding to Flanders to secure foreign co-operation. As money was needed, three wealthy gentlemen, Sir Everard Digby, Ambrose Rookwood, and Francis Tresham, were made privy to the plot. The meeting of parliament was again deferred to Nov. 5, and Fawkes was appointed to fire the mine. The conspiracy was detected by an anonymous letter entreating Lord Montague, a Roman Catholic peer, to absent himself from the parliament, and intimating a terrible danger. The letter resulted in a search on the night of Nov. 4, when Fawkes was seized just after issuing from the cellar, in which the powder was discovered. Matches and touchwood were found in his pockets. Brought before the king and council, he boldly avowed his purpose, but not even the threat of torture could extort the names of his associates till they had appeared in arms. The failure of the plot was complete. Fawkes was arraigned, condemned, and executed, as were seven of his confederates, while others were tried separately. This conspiracy led to additional penal statutes against the Roman Catholics. The anniversary of the plot, Nov. 5, was long celebrated in England and New England by the days carrying about an effigy of Guy Fawkes, which was finally burned. It was till recently a legal holiday in England.

FAXARDO, Diego Saxadra, a Spanish author and statesman, born in Algezares, in the province of Murcia, in 1584, died in Madrid, Aug. 24, 1648. Having graduated as a doctor of law at the university of Salamanca, he accompanied as secretary Cardinal Borja, appointed ambassador to Rome, and afterward succeeded him. His talents and ability in his negotiations gained for him the favor of his sovereign, and during 36 years he was constantly employed on important diplomatic missions in Italy, Switzerland, and Germany. His last mission was at the congress of Münster from 1648 to 1648, as representative of Philip IV. The first edition of his most successful work, 

Empresas políticas, & idea de un príncipe político cristiano, &c., intended to instruct the infant of Spain, to whom it was dedicated, in the duties of government, appeared at Münster in 1648. He wrote the first two volumes of the "History of the Goths in Spain." His complete works were published at Antwerp in 1688, and a new edition at Madrid in 1789–90.

FAY, Andrés, a Hungarian poet, born at Kohany, in the county of Zemplén, May 30, 1760, died July 30, 1844. He studied law, became an advocate, and subsequently officiated as an administrative officer of the county of Pesth, and in 1835 as its deputy at the diet. His feeble health obliged him to retire, and he thenceforth devoted himself to literature. He was one of the founders of the national theatre of Buda, and was an active member of the industrial society, of the society of arts, of the academy, &c. Among his poetical writings the most noted is his >Misk ("Fables," Vienna, 1820; 2d ed., 1824; German translation by Petz, Vienna, 1821). He wrote two works treating on foreign education and the social and economical development of Hungary, Nő- nevelés, &c. (Pesth, 1840), and Kelet népe nyugodon (Pesth, 1841). A collection of his works appeared at Pesth in 1848–49 (8 vols.).

FAYET, Theodor Bedford, an American author, born in New York, Feb. 10, 1807. He received a liberal education, and was admitted to the bar in 1828, but became soon after one of the editors of the "New York Mirror," and devoted himself to literature. He has published the following works: "Dreams and Reveries of a Quiet Man" (1882); "The Minute Book," a journal of foreign travel; "Norman Leslie," a romance (1835); "Sydney Clifton" (1839); "The Countess Ida" (1840); "Howard of Vaux," a romance of New York" (1845); "Robert Rufiel" (1844); "Ulric, or the Voices," a poem (1851); "Views of Christianly" (1856); "Great Outlines of Geography" (1867); "First Steps in Geography" (1873); and a series of papers on Shakespeare. He was secretary of the American legation in Berlin from 1857 to 1858, and minister resident in Bern, Switzerland, from 1858 to 1861. FAYAL, one of the Azores or Western Islands, belonging to Portugal, in lat. 38° 38' N., lon. 28° 40' W.; area about 40 sq. m.; pop. about 27,000. The surface is rugged, and in some parts mountainous. The climate is mild and healthful. The soil is in general very fertile. The principal vegetable productions are flax, palms, vines, pineapples, oranges, potatoes, cabbages, maize, and wheat. The chief object of commerce is wine, of which the annual produce is about 200 pipes; and in good seasons from 8,000 to 10,000 pipes, the product of all the islands, have been exported from Fayal. The other most important exports are fruit, especially oranges, and corn. The imports are manufactured goods, cotton twist, flour, coffee, sugar, tea, tobacco, and soap. In 1869 the island was visited by a severe famine, occasioned by the failure of three successive crops. Fayal has the best harbor of all the Azorean group, and a considerable transit trade. Many American whalers touch here and land the oil of such fish as they have caught in their outward voyage, whence it is shipped for its destination. Capital, Horta, or Villa Orta (sometimes improperly called Fayal), a handsome town on the S. E. side of the island, adjoining the harbor before mentioned; pop. 5,000 or 6,000. The steam packets of the British West India mail company regularly call at Horta.

FAYETTE, the name of 11 counties in the United States. I. A S. W. county of Pennsylvania, bordering on Maryland and West Virginia, and bounded W. by the Monongahela river; area, about 800 sq. m.; pop. in 1870, 45,384. There are two mountain ridges: one called Laurel hill, stretching along the E.
boundary, and the other known as Chestnut ridge, a branch of the Alleghanies, traversing the central part. The rest of the surface is mostly undulating. The soil is fertile in the N. W. part, but elsewhere is better adapted to pasture than to tillage. Iron and bituminous coal are abundant. It is intersected by the national road, and accessible by steamboats on the Monongahela. The Pittsburgh and Connellsville railroad passes through it. The chief productions in 1870 were 302,536 bushels of wheat, 23,768 of rye, 924,268 of Indian corn, 633,897 of oats, 79,855 of potatoes, 55,725 tons of hay, 491,993 lbs. of butter, and 287,792 of wool. There were 8,516 horses, 8,404 milk cows, 15,799 other cattle, 65,261 sheep, and 18,852 swine; 20 manufactories of carriages and wagons, 1 of cars, 1 of cement, 4 of bricks, 18 of clothing, 7 of oke, 18 of barrels and casks, 4 of window glass, 9 of iron and products of the same, 3 of machinery, 12 of saddlery and harness, 4 of woollen goods, 1 ship building and repairing establishment, 8 planing mills, 18 saw mills, 7 distilleries, 19 tanneries, 4 currying establishments, and 21 flour mills. Capital, Uniontown. II. A S. central county of West Virginia, bounded N. by the Kanawha or New river, which intersects the county, is a remarkable cliff, 1,000 ft. high, called Marshall’s pillar. The scenery of the county is exceedingly picturesque; the soil is generally good, and among the highlands particularly there are many open tracts of remarkable fertility. Iron ore is the principal mineral. The chief productions in 1870 were 18,317 bushels of wheat, 123,229 of Indian corn, 41,991 of oats, 72,188 lbs. of butter, 16,381 of wool, and 188,915 of tobacco. There were 1,317 of hemp, 19,767 of lightning, 10,148 of wheat, 13,715 of other cattle, 8,709 sheep, and 6,898 swine. Capital, Fayetteville. III. A W. county of Georgia, bounded S. and E. by Flint river; area, 800 sq. m.; pop. in 1870, 7,983, of whom 1,121 were colored. The surface is mostly level, and the soil, formed by the disintegration of primary rocks, is unproductive. Granite and iron are the principal minerals. The Atlanta and West Point and the Savannah, Griffin, and North Carolina railroads traverse it. The chief productions in 1870 were 25,646 bushels of wheat, 104,486 of Indian corn, 11,916 of oats, and 2,951 bales of cotton. There were 8,537 cattle, 2,241 sheep, and 5,779 swine. Capital, Fayetteville. IV. A N. W. county of Alabama; area, about 550 sq. m.; pop. in 1870, 7,136, of whom 1,077 were colored. It has a moderately undulating surface, drained by numerous streams, and a productive soil. The chief productions in 1870 were 14,566 bushels of wheat, 201,228 of Indian corn, 13,288 of oats, 27,702 of sweet potatoes, 18,194 lbs. of wool, 97,850 of butter, and 1,909 bales of cotton. There were 1,450 horses, 2,534 milk cows, 5,107 other cattle, 6,334 sheep, and 10,988 swine. Capital, Fayette Court House. V. A S. E. county of Texas, intersected by the Colorado river, which is navigable during half the year to this point; area, 1,025 sq. m.; pop. in 1870, 16,683, of whom 5,901 were colored. The surface is undulating, and the soil, consisting of a black sandy loam, is highly productive. Coal is the most important mineral production. The chief productions in 1870 were 459,392 bushels of Indian corn, 84,206 of sweet potatoes, 144,196 lbs. of butter, 16,380 of wool, and 10,658 bales of cotton. There were 6,650 horses, 10,886 milk cows, 44,698 other cattle, 10,006 sheep, and 17,293 swine; 12 saw mills and 4 manufactories of saddlery and harness. Capital, La Grange. VI. A S. W. county of Tennessee, bordering on Mississippi, and watered by Loudon and Wolf rivers; area, about 566 sq. m.; pop. in 1870, 26,145, of whom 16,987 were colored. It has a fertile, well cultivated soil. It is traversed by the Memphis and Charleston, and its Somerville branch, and the Memphis and Louisville railroads. The chief productions in 1870 were 11,736 bushels of wheat, 697,371 of Indian corn, 26,077 of sweet potatoes, and 20,181 bales of cotton. There were 2,839 horses, 4,078 mules and asses, 4,584 milk cows, 5,277 other cattle, 3,828 sheep, and 80,762 swine; 1 saw mill and 4 flour mills, and 5 manufactories of carriages and wagons. Capital, Somerville. VII. A central county of Kentucky, bounded S. by Kentucky river, and drained by some of its affluents; area, about 800 sq. m.; pop. in 1870, 28,656, of whom 12,513 were colored. It has a rolling surface, and a fertile and well tilled soil, underlying which is an excellent species of building stone called blue or Trenton limestone. The Kentucky Central and the Louisville, Cincinnati, and Lexington railroads pass through it. The chief productions in 1870 were 28,922 bushels of wheat, 49,628 of rye, 1,117,190 of Indian corn, 176,876 of oats, 25,267 of barley, 49,439 of potatoes, 4,899 tons of hay, 177,745 lbs. of butter, and 26,491 of wool. There were 5,552 horses, 2,354 mules and asses, 8,753 milk cows, 12,501 other cattle, 7,477 sheep, and 20,676 swine; 4 manufactories of agricultural implements, 8 of bagging, 3 of boots and shoes, 20 of carriages and wagons, 8 of confectionery, 1 of cotton goods, 2 of furniture, 1 of gas, 1 of malt, 5 of saddlery and harness, 5 of tin, copper, and sheet-iron ware, 2 planing mills, 8 distilleries, and 7 flour mills. Capital, Lexington. VIII. A S. W. county of Ohio; area, 414 sq. m.; pop. in 1870, 17,170. It has a level or undulating surface, and a fertile soil, consisting of deep black loam. It is intersected by the Cincinnati and Marietta railroad. The chief productions in 1870 were 180,510 bushels of wheat, 2,055,926 of Indian corn, 66,841 of oats, 50,829 of potatoes, 12,015 tons of hay, 861,725 lbs. of butter, and 154,739 of
wool. There were 7,285 horses, 4,889 milch cows, 12,277 other cattle, 84,394 sheep, and 51,955 swine; 3 manufactories of boots and shoes, 10 of bricks, 7 of carriages and wagons, 5 of saddlery and harness, 1 of sashes, doors, and blinds, 1 of woollen goods, 2 flour mills, and 4 saw mills. Capital, Washington. IX. A S. E. county of Indiana; area, about 200 sq. m.; pop. in 1870, 10,476. The surface is level or undulating, and the soil fertile. Lime- stone is the principal rock. The Fort Wayne, Muncie, and Cincinnati, the Cincinnati and Indianapolis Junction, the White Water Valley, and the Columbus, Shelby, and Cambridge City branch of the Jeffersonville, Madison, and Indianapolis railroads intersect it. The chief productions in 1870 were 271,150 bushels of wheat, 685,454 of Indian corn, 56,348 of oats, 26,118 of potatoes, 5,554 tons of hay, 98,874 lbs. of butter, and 81,320 of wool. There were 3,801 horses, 2,631 milch cows, 5,167 other cattle, 8,106 sheep, and 20,879 swine; 2 manufactories of boots and shoes, 11 of carriages and wagons, 8 of furniture, 1 of iron castings, 1 of machinery, 1 of printing paper, 7 of saddlery and harness, 1 of woollen goods, 4 flour mills, and 3 saw mills. Capital, Connersville. X. A S. central county of Illinois, intersected by Kaskaskia river; area, 640 sq. m.; pop. in 1870, 19,688. The surface is level, and occupied by alternate tracts of fertile prairie and good timber land. A number of small streams supply it with water power. The Illinois Central and the St. Louis, Vandalia, Terre Haute, and Indianapolis railroads pass through it. The chief productions in 1870 were 851,310 bushels of wheat, 962,625 of Indian corn, 497,895 of oats, 73,845 of potatoes, 20,844 tons of hay, 928,710 lbs. of butter, 54,446 of wool, and 88,156 of tobacco. There were 8,898 horses, 6,261 milch cows, 7,928 other cattle, 21,284 sheep, and 25,817 swine; 11 manufactories of carriages and wagons, 10 flour mills, and 20 saw mills. Capital, Vandalia. XI. A N. W. county of Iowa; area, 730 sq. m.; pop. in 1870, 16,975. It is drained by the head branches of Turkey river, is well supplied with water power, and has a healthy climate. The surface is undulating, and occupied partly by fertile prairies and partly by forests. The chief productions in 1870 were 478,588 bushels of wheat, 448,028 of Indian corn, 836,076 of oats, 28,563 of barley, 58,953 of potatoes, 27,927 tons of hay, 424,868 lbs. of butter, and 88,290 of wool. There were 4,901 horses, 5,937 milch cows, 7,646 other cattle, 11,771 swine, and 14,160 swine; 4 manufactories of carriages and wagons, 2 of barrels and casks, 5 of saddlery and harness, 1 brewery, 10 flour mills, and 18 saw mills. Capital, West Union.

FAYETTEVILLE, a city and the capital of Cumberland County, North Carolina, on the W. bank of Cape Fear river, at the head of natural navigation, 100 m. above Wilmington, and at the terminus of the Western railroad of North Carolina, 55 m. S. of Raleigh; pop. in 1870, 4,660, of whom 2,818 were colored. It is the centre of an active trade, and the seat of manufactories of some importance. The Cape Fear river has been rendered navigable by means of locks and dams as far as the coal mines of Chatham co., and plank roads have been constructed leading to various parts of the interior. The neighboring pine forests furnish large quantities of lumber, tar, and turpentine for exportation. The city contains 10 turpentine distilleries, two manufactories of cotton sheetings, and two national banks. It is governed by a mayor and a board of seven commissioners. It has an academy, a female high school, a colored primary school, two private schools, a semi-weekly and two weekly newspapers, and 25 churches, viz.: 5 Baptist, 3 Episcopal, 8 Methodist, 8 Presbyterian, and 1 Roman Catholic.—Fayetteville was settled in 1762, and before receiving its present name in 1784 was known successively as Campbelltown and Cross Creek. In 1881 it was partly destroyed by fire. The United States arsenal at this point, containing 86,000 small arms besides a number of cannon and a considerable quantity of ammunition, was taken possession of by the Confederates, April 22, 1861. The city was occupied by Gen. Sherman, March 11-14, 1865, when the arsenal with the machinery which had been brought from Harper's Ferry was destroyed.

FAYUM, or Fayum (Copt. Ptoium, the waters), a valley of central Egypt, anciently the Arsinoite nome, about 40 m. S. W. of Cairo, on the W. side of the Nile at length from E. to W. about 40 m., breadth about 80 m.; pop. nearly 150,000. It is of an almost oval form, enclosed by a chain of the Libyan hills, which here bend round to the west and north. It forms in fact a basin with only one opening toward the Nile on the east, and gradually sloping toward the north and south, the northern depression being occupied by the Birket-el-Keroum, long supposed to be identical with the lake known to the ancients as the lake of the Bahar Yusef (canal of Joseph), which is divided into numerous branches to irrigate the country. The parts thus watered are remarkably fertile, producing grain, cotton, olives, figs, apricots, and other tropical fruits. Roses are abundant, and the natives produce large quantities of rose water, which is sold all over Egypt. The principal town is Medinet el-Fayoum (anc. Crocodilopolis and Arsinoe), near which are several broken columns of red granite, carved in old Egyptian style with lotus-bud capitals, supposed to mark the site of the famous labyrinth described by Herodotus. N. of the town Belzoni found two immense stone pedestals, called by the natives Pharao'h's feet, various granite statues, some wrought iron, and a quantity of half melted glass. At a some distance stands a syenite obelisk, 48 ft. high and covered with hieroglyphics. About 3 m. from the lake stands a temple known as Kasr Keroon, 94 ft. long, 68 ft. broad, and 40 ft. high, with 14 chambers,
which appears to be of the Roman period. On the S. W. bank of the lake are what are supposed to be the remains of Bacchis. The direction of the principal streets and the ground plans of houses may still be traced.

Fazy, Jean Jacques, a Swiss politician, born in Geneva, May 12, 1796, died Nov. 5, 1878. He completed his education in France, wrote several treatises on political economy, and was connected with journalism in Paris (where his radical opinions involved him in difficulties with the government) and in Switzerland. After his return to Geneva he took an active part in the establishment of a new constitution, and distinguished himself as the principal champion of the introduction of trial by jury, which institution was adopted, Jan. 12, 1844. In 1846 the radicals became exasperated at the neutrality observed by the Genevese government in the conflict between the Catholic and Protestant cantons. A revolution broke out on Oct. 5, a provisional government was established on the 9th, and Fazy, who placed himself at its head, became the ruling spirit of the new grand council of Geneva. The city was embellished under his direction, and he also gave a powerful impulse to the construction of railroads and telegraphs. As a delegate of Geneva in 1847 he exerted himself in behalf of the new federal constitution, which was adopted Sept. 19, 1848. From February to December, 1848, he was out of office, owing to disagreement with some of his colleagues; but with this exception he was uninterrupted in his office at the head of the Genevese government until Nov. 14, 1853. In 1858 he was vice president of the federal council of states, and in 1854 president; and in 1855 he was reinstated in his former position of president of the government of Geneva, but had to resign in November, 1864. Having been indicted as the leader of the riots which took place in August, he fled to France, but returned when the case was abandoned, and was appointed to a seat in the grand council, which he gave up again in 1866, and accepted anew in 1868. He has written Essai d'un précis de l'histoire de la république de Genève (Geneva, 1838).

FEATHER GRASS (stipa pennata, Willd.), a grass readily distinguishable by its elegant and feather-like awns. It grows in close, matted tufts, having very long, fine, wiry, dark green leaves, numerous tall flower stalks with small flows, succeeded by an abundance of sharply pointed elliptical grains, each of which is surmounted by the feathered awn or bristle, a foot or more in length. This is of a rich bird-of-paradise color, and gives a remarkable beauty to the plant. Gerarde, a famous herbalist in 1597, informs us that these awned seeds were worn in his time by "sundry ladies instead of feathers." It is this species which is the principal grass in the portions of the steppes of Asia called the truse or pasturing grounds, growing in immense quantities, and developing its woody root stocks above the soil, much to the annoyance of the mower. The seeds of this beautiful grass are frequently imported from abroad and sold in our seed shops, but they seldom vegetate.

FEATHER RIVER, a stream rising in the N. E. part of Plumas co., California, which flows S. W. and S. through a rich gold region, and empties into the Sacramento, 80 m. above Sacramento City; length about 180 m. It is navigable as far as Marysville, to which point steamboats ascend from San Francisco. The North and Middle forks, and Yuba river, are its principal tributaries.

FEATHERS, a complicated modification of the tegumentary system, forming the external covering or plumage of birds. Though chemically similar to and homologous with the hair of mammals, their anatomical structure is in some respects different. An ordinary feather is composed of a quill or barrel, a shaft, and a vane or beard consisting of hairs and barbules. The quill, the part attached to the skin, is a hollow cylinder, semi-transparent, composed of coagulated albumen, resembling horn both in appearance and chemical constitution. It is light, but strong, terminated below by an obtuse extremity pierced by an opening, the lower umbilicus, through which the primary nutritive vessels enter; above, it is continuous with the shaft, with which it communicates internally by an opening, the upper umbilicus; the cavity contains a series of conical shrivelled membranes, fitting one upon the other, that have formerly been subserient to the growth of the feather. The shaft is more or less quadrilateral, gradually diminishing in size to the tip; it is always slightly curved, convex above, and the concave lower surface, divided longitudinally by a groove, presents two inclined planes meeting at an obtuse angle; it is covered by a thin horny layer, and contains in its interior a white, soft, elastic substance,
called the pith, which supplies strength and nourishment to the feather. The vane consists of two webs, one on each side of the shaft, each web being formed of a series of laminae or bars, of varying thickness, width, and length, arranged obliquely on the shaft, and composed of the same material; their flat sides are placed close to each other, enabling them to resist any ordinary force acting in the direction of their plane, as the impulse of the air in the act of flight, though yielding readily to any force applied in the line of the shaft. The bars taper to a point, but are broad near the shaft, and in the large wing feathers the convexity of one is received into a concavity of another; but the bars are kept in place chiefly by barbules, minute curved filaments arising from the upper edge of the barb, as the latter does from the shaft; there are two sets, one curved upward and the other downward, those of one barb hooking so firmly into those of the next as to form a close and compact surface; in the ostrich the barbules are well developed, but are long, loose, and separate, giving that soft character conveyed by the term plumæ. The barbules are sometimes provided with a similar apparatus on their sides called barbicels, as in the quills of the golden eagle and albatross; these serve to keep the barbules in position, but are less numerous than the latter. In most feathers there is an appendage near the upper umbilicus of a barb character, called the accessorie plume; small in the quills of the wings and tail, in some body feathers of hawks, ducks, and gulls it is of large size, in some species as large as the feather which supports it; in the emu two plumy feathers arise from one quill, and sometimes three in the cassowary, the additional plumæ being these accessory feathers; in the ostrich there is no such additional tuft. There is, therefore, every gradation from a simple barrel and shaft, as in the cassowary’s quills, to the feather with barbs, barbules, and barbicels. Some feathers are all downy, like the abdominal ones of the eagle-owl; others have very little down, as the harsh plumage of the penguin; in the eider duck, and other Arctic species, there is at the base of the common feathers a soft downy coating, securing warmth and light, like the soft fur at the base of the hair of Arctic mammals; young birds are covered with down before the development of feathers, the latter being guided through the skin by the former. In the chick the formation of down begins on the eighth day of incubation, and is continued until the hatching; 10 to 12 radiating filaments are formed at the same time in an epidermic sheath, which soon after birth dries and sets free the plumes, allowing them to spread out as a pencil of down; a stem is developed, and the downy filaments become the primary web of the feather. Feathers in some cases resemble stiff bristly hairs, as about the bill in most birds, and the tuft on the breast of the wild turkey. In the genus *Anseriformes*, peculiar to the Philippine islands, we have remarkable instances of the modifications of the epidermic covering of birds. In *D. Cumingii* (Fras.), the feathers of the crest, breast, and throat are changed at their extremities into ovoid horny lamellae, looking like shining black spangles, expansions of the true horny structure of the shaft; something of the kind is seen in the Bohemian chatterer or wax-wing (*Anisoptera garrulus*, Linn.), in which some of the secondary and tertiary quill feathers end in small, oblong, flat appendages, in color and consistency resembling red sealing wax, which are also expanded horny prolongations of the shafts of the ordinary feathers. In *D. superciliosus* (Cuv.), the only other species of the genus, the feathers over each eye are changed for three fourths of their length into red silky hairs or bristles, the base of the feather having the usual appearance; each shaft seems to divide into several of these hair-like filaments, which are finer and more silky than the appendage on the breast of the turkey, and directly continuous with ordinary feather structure, while in the turkey there is a complete transformation of feathers into hairs in the whole extent. In most birds there will be found a number of simple hair-like feathers scattered over the skin after they have been plucked; they arise from short bulbs or slender rounded shafts. Feathers are developed in depressions in the skin lined by an inversion of the epidermis which surrounds the bulb; they grow by the addition of new cells from the bulb, which become modified into the horny and fibrous stem, and by the elongation and extension of previously formed cells; like the hair, they originate in follicles provided without a true root-cell, though when fully formed the cellular structure is widely departed from except in the medullary portion. They are, when first formed, living organized parts, developed from a matrix connected with the vascular layer.
of the skin, and growing by nutritious vessels; when fully developed, the vessels become atrophied, and the feathers dry and gradually die from the summit to the base, so that at last they become dead foreign bodies, as completely incapable of vital modifications as the perfect horns of the deer. The matrix which produces the feather, according to Owen, has the form of an elongated cylindrical cone, and consists of a capsule, a bulb, and intermediate membranes which give proper form to the secretion of the bulb; as the conical matrix sinks into and becomes more intimately connected with the true skin, its apex protrudes above the surface, and the investing capsule drops off to give passage to the feather which has been growing during this period; the capsule is made up of several layers, the outermost consisting of epidermic cells, and its centre is occupied by a soft fibrous bulb freely supplied with blood vessels from below and a nerve; between the bulb and the capsule are two parallel membranes, in whose oblique septa or partitions the barbs and barbules are developed, nearly in the same way that the enamel of the teeth is formed between the membrane of the pulp and that of the capsule. The part to which the barbs are attached and the pith of the shaft are formed respectively from the outer and inner surfaces of the membranes of the compound capsule; the shaft and barbs at the apex of the cylinder become hardened first, and are softer the nearer the base of the matrix; the first formed parts are pushed forward by the cell growth at the base, the products of the bulb being moulded into shape by the membranes exterior to it; the successive stages of the growth of the medullary matter are indicated by a series of membranous cones or caps, the last formed of which cannot escape from the hardened and closed shaft, and constitute the light dry pith seen in the interior of the quill; these cones are originally connected together by a central tube, and the last remains of the bulb are seen in the ligament which passes from the pith through the lower umbilicus, attaching the quill to the skin. Feathers grow with great rapidity, and in some birds to a length of more than two feet; they are almost always renewed annually, and in many species twice a year; this amount of formative power demands a considerable increase of the cutaneous circulation, making the season of molting always a critical period in the life of a bird. The plumage is generally changed several times before the bird is adult; but some of the falcons are said to assume the mature plumage after the first moult, as the Greenland and Iceland falcons.—Feathers serve to protect birds from injurious external influences, such as extremes of cold and heat, rain, &c., for which their texture and imbricated arrangement admirably adapt them; and they also furnish their principal means of locomotion, in the latter case being stronger, more compact, and longer than those which cover the body. They generally increase in size from the head backward, and have received special names according to the region of the body, which are important aids in describing and recognizing species. Some of these names, constantly used in the ornithological articles of this Cyclopædia, not readily understood from the words themselves, are as follows: the scapulars, above the shoulder blade and humerus, apparently on the back when the wing is closed; axillaries, long and straight feathers at the upper end of the humerus, under the wing; tibias, covering the leg; lesser wing coverts, the small feathers in rows upon the forearm; under coverts, lining the lower side of the wings; the longest quill feathers, arising from the bones of the hand, are the primaries; the secondaries arise from the outer portion of the ulna, and the tertaries from its inner portion and the humerus; the bastard wing consists of the quills growing from the rudimentary thumb; greater wing coverts, the feathers over the arm and under, those above and below the base of the tail feathers. The relative size of the quills on the hand and forearm, and the consequent form of the wings, are characteristic of
the families of birds, and modify essentially their powers of flight. The breadth of the wing depends principally on the length of the second to fourth, and its length on that of the primaries. Leaving out of view the proportions of the bones and the force of the muscles of the wings, when the primaries are longest at the extremity of the pinion, as in the falcons and swallows, causing an acuminate form of wing, we may know that the powers of flight are great, requiring comparatively little exertion in the bird; but when the longest primaries are in the middle of the series, giving rise to a short, broad wing, as in the partridge and grouse, the bird can fly only a short distance at a time, with great effort, and a whir well known to the sportsman. Not only the shape of the wing, but the close texture of its feathers, must be taken into account in the rapid strong flight of the falcon; the loose soft feathers of the wings in the owls, and the serrated outer edge of the primaries, while they prevent rapid flight, enable them to pounce noiselessly upon their vigilant prey.—Most birds, and especially the aquatic families, are provided with an oil gland at the base of the tail, whose unctuous secretion is distributed over the feathers by means of the bill, protecting their surface against moisture; the shedding of the water is not owing entirely to the oily covering, but also to a thin plate of air entangled by the feathers, and probably also to an actual repulsion of the particles of water by the feathers, as is seen in the leaves of many aquatic plants; the arranging of the plumes by the bill of the bird being rather to enable them to take down a large quantity of air, than to apply any repellent oily covering.—The plumage of birds has an infinite variety of colors, from the sombre tints of the raven to the pure white of the egret, and the gorgeous hues of the lory, toucan, trogon, and humming birds; the females have generally less lively colors, and the summer livery of both sexes is often different from that of winter. One of the most curious phenomena connected with feathers is the annual moult, and the change of color during that and the breeding season; moult often takes place after the young have been hatched, the whole plumage becoming dull and rough, and the bird more or less indisposed, with a temporary loss of voice in the singing species. According to Mr. Yarrell, the plumage of birds is changed by the mere alteration of the color of the feathers; by the growth of new feathers without the loss of any old ones; by the production of new feathers in the place of old ones thrown off, wholly or in part; and by the wearing off of the light tips as the breeding season approaches, exposing the brighter tints underneath. The first two of these changes occur in adults at the end of spring, the third being partial in spring and complete in autumn. Though the perfect plumage is non-vascular and epidermic, the colors change, probably by some vital process, without the loss of a feather; when the winter livery succeeding the autumnal moult begins to assume its bright characters, the new color generally commences at the part of the web nearest the body, and gradually extends to the tip. Until within the last few years the changes of color in the fur of mammals (as in the ermine in winter), and in the plumage of birds in the season of reproduction, were supposed to be effected by the simple reproduction of the hairs and feathers; but this cannot be the case, as many facts go to prove that these changes occur at other times than the period of moulting, and without the loss of a hair or feather. It is well known that vivid emotions of fear or grief may turn the human hair gray or white in so short a period that there could be no change in the hair itself to account for it; and a case is on record of a startling which became white after being rescued from a cat. It has been maintained by Schlegel and Martin that many birds always get their wedding plumage without moulting. The fact being admitted, how can the change of color be explained in the mature feather, which has no vascular or nervous communication with the skin? The wearing away of the light tips, mentioned by Mr. Yarrell, is not only unphysiological, but in most cases does not happen. Dr. Weiland, from the examination of bleached specimens in museums, and of recent birds, expresses the belief that the brightness and fading of the colors are owing to the increase or diminution of an oily matter in the feathers; the microscopic examination of the web of feathers from the breast of a fresh merganser (mergus serrator, Linn.) showed numerous lacuna of a reddish oil-like fluid; some weeks after, the same feathers, having become nearly white from exposure to light, disclosed air bubbles instead of the reddish fluid; from this he concludes that the evaporation of the oily fluid, and the filling of the spaces with air as in the case of the white water lily, produces the changes of color. If this fluid be oily, as there is good reason to believe, mere physical impulsion would be sufficient to introduce it into the dead feathers, as it is well known that fat passes through all tissues very readily, even through compact horn. In the season of reproduction, the nutritive and organic functions are performed with their utmost vigor, and the supply of fatty coloring matter would flow freely to the feathers; under the opposite conditions of debility, cold, or insufficient food, the oily matter would be withdrawn and the feathers would fade.—In regard to the value of feathers to man, it will be sufficient to enumerate the ornamental employment of the plumes of the ostrich, egret, crane, and peacock; the economical uses of the down of the elder duck and the plumage of the goose; the importance of the goose quill before the introduction of steel and gold pens, and the adherence of many at the present day to the more perishable, less convenient, but softer-moving quill; not to more than allude to the consumption of the plumage of the gorgeous tropical birds in the
FEBRUARY

manfacture of feather flowers, and the utility of the downy arctic skins as articles of dress in the regions of perpetual snow.

FEBRUARY (Lat. Februarius, from febura, to purify; so called from februa, the festival of expiation and lustration, which was held on the 15th of this month), the second month in our present calendar, containing 28 days ordinarily, and 29 days in leap year. It was not in the calendar of Romulus. Numa added two months to the year, January at the beginning and February at the end. It was first placed after January by the decemviars about 450 B. C.

FÉCAMP (formerly Facon or Fecamp; Lat. Fecacum or Fiscicum), a seaport town of France, in the department of Seine-Inférieure, 22 m. N. N. E. of Havre, on a branch railway from Rouen, and at the entrance of the river Fécamp into the channel; pop. in 1866, 12,953. The town has two remarkable churches, a hydrographical museum, a theatre, a commercial court, a chamber of commerce, and extensive sea-bathing establishments. The chief occupations of the inhabitants are fishing, ship building, and commerce, but its manufactures are also becoming important. The town is believed to owe its origin to a celebrated female convent which was founded about 563. It has repeatedly been destroyed in times of war. As early as the 15th century it was famous for its herring fisheries.

FEDERER, Gustav Theodor, a German naturalist, born at Gross-Sährchen, Lustat, April 19, 1801. He studied at the university of Leipsic, and was professor of physics there from 1834 to 1839, when a disease of the eyes disabled him from teaching, and he devoted himself especially to anthroplogy and natural philosophy. He had early attracted attention by researches in geology and botany, and translations of French scientific works, by papers relating to chemistry and pharmacy, and by humorous writings. Stapeliae mixta, which he published in 1824 under the name of Dr. Miesa. In his Beweis, dass der Mond aus Jodine besteht (3d ed., 1883) he deals with scientific problems in a humorous vein. His Büchlein vom Leben nach dem Tode (1860), Gedichte (1842), and Reiseblickein (3d ed., 1865) contain admirable specimens of poetry. His other principal works are: Nanna, oder über das Seelenleben der Pflanzen (1848); Zent-Aevata, oder über die Dinge des Himmels und des Jenseits (3 vols., 1851); Elemente der Psychophysik, his most important scientific work (2 vols., 1860); and Physikalische und philosophische Atomirenlehr (3d ed., 1864).

FEDERICO, Charles Albert, a French actor, born in London, Oct. 23, 1854. The son of a German father and a French mother, he was reared principally in England and France, and after a good education he began in Paris the study of sculpture. Manifesting a strong inclination for the stage, he made his first appearance while still very young at the Salle Mollière in Le mari de la coque. After some weeks at the conservatory, he joined a company of French comedians for a year's tour through Italy. Returning to Paris, he again applied himself to sculpture, at the same time playing minor characters in the Théâtre Français. His first great success was in 1846 in the French theatre at Berlin, where he appeared as the original Duval in La dame aux camélias of Dumas the younger. In 1847 he played for a few weeks with a French company in London, and afterward till 1858 at different times he was prominent on the boards of the theatres Ambigu, Variétés, historiques, Porte Saint-Martin, and Vanves in Paris. From March, 1857, to the end of 1858, he was joint manager with M. de la Roumatt of the Odéon. Two years afterward he was induced to undertake characters in English on the London stage, and on Oct. 27, 1860, he opened at the Prince's theatre as Ruy Blas in his own version of Victor Hugo's play. On March 19, 1861, he appeared as Hamlet, playing the part in a flaxen wig and making other marked innovations upon the costume and conventionalities of the character. He played the part 70 successive nights, and excited an animated discussion among the London critics. He followed with Othello, Iago, Macbeth, Coriolanus, the "Corseican Brothers," Claude Melnotte, and other characters, in nearly all of which he achieved a remarkable success, in spite of his disregard of the traditions and conventionalities of the English stage. He leased the Lyceum, Jan. 1, 1863, opening as Legadere in "The Duke's Motto," and continued his management of that theatre for some years. He made his first appearance in America as Ruy Blas, in Niblo's theatre in New York, Jan. 10, 1870. In October following he opened the Globe theatre in Boston as manager, but soon returned to New York, and after a brief engagement at the French theatre, where he played several characters in English, he went back to London. Returning to New York in 1873, he leased the French theatre, and remodelled it; but failing to secure possession of the property, he made his first reappearance in New York, April 28, 1878, at the Grand Opera House, as Edmond Dantes in his own version of "Monte Cristo."

FEDCHENKO, Alexei, a Russian naturalist, born about 1830, died near the summit of the Col du Géant, Switzerland, Aug. 14, 1878. He resided at Moscow, and was a high authority on the geography of central Asia. He went to Switzerland to compare the glaciers of Mont Blanc and the Col du Géant with those which he had discovered in the mountains of Khokan. He left Montreux on foot for Chamouni Aug. 12, and on the 14th proceeded to the Col du Géant with two guides. He had gone within about two hours' walk of the summit when a violent storm and avalanches of snow forced him to retrace his steps, and he fell from exhaustion and perished. He left unfinished an important work, which his wife, who...
companied him in all his journeys, though not in this ascent, designs publishing.

FEDERALISTS, a political party in the United States who claimed to be the peculiar friends of the constitution and of the federal government. Their opponents, the republicans, they called anti-federalists, and charged them to a certain extent with hostility to or distrust of the United States constitution and the general government. The republicans, however, strenuously denied the truth of these charges. The federalist party was formed in 1788. Its most distinguished leaders were Washington, Adams, Hamilton, Jay, and Marshall; and the leading federalist states were Massachusetts and Connecticut, supported generally, though not uniformly, by the rest of New England; while Jefferson, Madison, Monroe, Burr, George Clinton, and Gallatin led the opposition. In the contests of the French revolution the federalists leaned to the side of England, the republicans to that of France. The former were defeated in the presidential election of 1800, when the republican candidates were elected, Jefferson president, and Burr vice president. Their opposition to the war of 1812, and above all the calling of the Hartford convention, completed their destruction as a national party. In 1816 Monroe, the republican candidate for president, received the electoral votes of all the states with the exception of Massachusetts, Connecticut, and Delaware, which gave 34 votes against him, while from the other states he received 182. At the next election in 1820 the federalist party was disbanded, Monroe receiving every electoral vote except one.

FEE. See Fiduciary.

FEE, a law term, derived probably from Sax. feoh, or more accurately feodum, compensation or payment. As landed estates were given by the northern conquerors of the Roman provinces to their nobles and soldiers as compensation or wages for military service, fee came to mean the estate itself. It was Latinized into feudum or feodum, from which the word feudal arose, because it was this tenure of land which characterized what is called the feudal system. The derivation and original meaning of this word are not certainly known, but what we have given is, we think, supported by the best reasons. In law, estate does not mean the land, but the title which a man has in the land; so the word fee is now used to signify, not the land, but the kind of estate or tenure by which it is held. The word fee alone means an estate without qualification or limitation; hence the phrase fee simple means the highest estate held of any superior or lord, or by any tenure or service, or strictly speaking, by any tenure whatever; and the word simple means only that nothing is added to limit or condition the word fee. Hence an estate in fee and an estate in fee simple are the same thing. This is an absolute estate of inheritance; or an estate which a man holds, descendscible to his heirs for ever. There is no event by which it must be terminated or defeated, and no limitation or restriction by force of which it must descend to a certain heir or heirs, in exclusion of the rest. A fee simple may be acquired by descent or by purchase. In law, purchase means every mode of acquiring land except descent; hence if land be given to a man, or devised to him, and he takes by gift or by devise, still he remains the owner to take by purchase. The essential words in any instrument by which a man should take land in fee, whether by will or deed, are, to the grantee, or devisee, and "his heirs." For if land be given to a man without the word "heirs," he takes only an estate for his own life, and at his death (if there be no remainder over) it reverts to the grantor or his heirs; and at common law there are no words which could supply the want of these "words of inheritance," as they are called, where there could be heirs. Thus, if land were conveyed or devised to a man "and his successors," he took only an estate for life; but if these words were used in a deed or devise to a corporation, they were the proper words to create a fee simple, because a corporation should have perpetual succession, but cannot have heirs. If land be granted or devised to A, B, and C, as trustees, then also the word successors would in general carry a fee. The ancient severity of the rule requiring words of inheritance is now relaxed somewhat in England, and more in the United States (in some of the states by statute), especially in respect to wills and trusts. In wills, any words distinctly indicating the purpose of the testator to devise all his estate and interest in a piece of land, are always held now to carry a fee simple; and in trusts, if one has land given to him with power to sell, this is held to be a power to convey in fee simple. In deeds it is always better to add the words of inheritance, but the word "assigns" is not necessary to give the power of transfer, although usually added. There may be a fee simple not only in lands, but in franchises and liberties; and in England, in dignities and the rights and privileges attached to them; and even in personal property, as in an annuity.—Fees may be less than fee simple, and they are so whenever not simple; that is, whenever the fee is in any way restrained or diminished. A qualified fee, technically so called, is one in which, by an original limitation, the land goes to a man and his heirs general, and yet is not confined to the issue of his own body; as if it be given him and to his heirs on the part of his father or a certain ancestor. A determinable fee is a fee which may continue for ever, but which may be determined by the happening of some event which is uncertain. Instances usually given of this are lands conveyed or devised to a man and his heirs until an infant shall attain a certain age, or until such a person shall be married, or shall have children. A conditional fee means either a fee to which at its origin some condition was annexed, which being
performed will defeat the estate, or the performance of which is necessary to preserve the estate, or the performance or occurrence of which is necessary to vest estate. But these three phrases are not definable with exact accuracy, and are sometimes used one for the other. Fee tail is a legal term of more precise meaning. It is derived from the Norman French word "taillé," to cut, because it is a lesser estate of inheritance cut or carved out of the fee simple; and it exists where a conveyance or devise is made to a person named and the heirs of his body or some specified class of the heirs of his body, as for instance the heirs male or heirs female of his body, or the heirs of his body begotten of his then wife. The difference between this and a fee simple is at once perceived, for while the latter on the owner’s death will pass by descent to the heirs general, who may be collateral relatives, the former will descend only in the line indicated by the instrument creating the estate. Formerly the understanding was that the grantee of an estate tail had only a life interest, and could convey no more; but afterward means were devised by which he might convey a fee, and this in the hands of his grantee would necessarily be a fee simple. The usual mode of doing this was the process of suffering a common recovery, but by statute 8 and 4 William IV., c. 74, the same result may be accomplished by an ordinary deed of conveyance duly enrolled. Legislation of a similar nature has also been adopted for Ireland and Scotland. In the United States estates tail have had no practical existence since the revolution. In some of the states they are wholly unknown. In others they become at once, by force of statutory provisions, estates in fee simple. In others a tenant in fee tail bars the entail by a simple conveyance in fee simple. In yet others, and they are numerous, they are simply aboliished by statute, without any reservation whatever.

FEJEJEE (FJ.), or Viti, ISLANDS, a group in the South Pacific ocean, between lat. 15° 30′ and 20° 30′ S., and lon. 176° 30′ E. and 178° 20′ W. Fejejee is the name in the windward, and Viti in the leeward part of the group. There are some 220 islands, of which about 140 are inhabited. The population is estimated at 30,000, of whom 4,000 are whites. Viti Levu, or Naviti Levu, is the largest and most populous of the group; it is about 64 m. from N. to S. and 97 from E. to W. Suva harbor is free from shoals, well sheltered, and of easy ingress and egress. The best known towns on this island are Namena, Ndwassamula, Tova, Nakorotubu, Rakiraki, Tavua, Mba, Namoli, Nandy, Vundu, Vitogo or Veitiri, Mbetaravu, Nabreka, Ndeumba, and Suva. Vana Levu (Gaduro island, generally called Vatu Levu) is inhabited, ranks next to Viti Levu, and is 69 m. N. of Bau, a small island on the E. side of the latter, from which distances in the group are reckoned; it is 118 m. long from E. N. E. to W. S. W., and an average 25 m. broad.

The principal towns of Vuna Levu are Mbau, Ndama, Navava, Solevi, Navatu, Navaussau, Undu, Namuka, Mathusa, Raviravi, and Wailea. The bay of Navaussau, 10 m. long by 5 broad, is surrounded by very high and broken land, rising in many places into lofty needle-shaped peaks; behind them several other high peaks reach to about 4,000 ft. A considerable stream of fresh water enters the bay, and a mile below on the beach are hot springs, which are continually steaming. The rock in the neighborhood is compact coral and volcanic breccia. The water has a faint smell of sulphur and a strong saline taste. The natives use the springs to boil their food, which is done by covering them with leaves and grass, when rapid ebullition ensues in the previously quiescent water. Taviuni, commonly but erroneously called by the white residents Vuna or Somosomo, is the third island in size and importance; it is about 24 m. long and 9 m. broad, and 5 m. S. E. of Vana Levu. The whole island is one vast mountain, 2,063 ft. high, and very fertile. On the top is a lake containing an abundance of large eels. The principal towns on it are Somosomo, Vuna, Weilangi, Wainikeli, and Mbonua. Kadavu or Kandavu is a large, populous, and well wooded island, 69 m. S. W. of Bau and 48 m. from the nearest point of Viti Levu; it is 22 m. long, and averages 4 m. in breadth. On the west is a small bay, Malatpa, which offers temporary anchorage, but it is difficult to enter on account of reefs. Westward of Malatpa is Tavutha bay, frequented by whalers. E. of Kadavu, and between it and the island of Ono, is a well protected harbor. The Mubikeleru mountain is very high. Another populous island is Gan or Ngau, 18 m. long and 4 broad, 38 m. E. of Bau. The reef extends a mile and a half off the N. E. point, and several miles off the S. side, but is closed to the island on the east, where there are several openings, but none fit for anchorage. There is good holding ground in the bay opposite the town of Lakemba. Other towns on this island are Sawayake (the chief town), Nakumbuna, Na-waikma (at which there are hot springs), Nakorowaro, Levuka, Ourata, Nathavandni, Lekanai, Nggarani, and Vioni. Koro (meaning "a town") is a very fine island, 94 m. long by 4 wide, 59 m. N. E. of Bau, with an anchorage on the N. W. side. The chief towns are Wailevu or Sithila, Tangandrenga, Thawala, Nusa, Waitaya, and Korolalai. Moaia, a high volcanic island, about 4 m. wide by 8 long, 88 m. E. S. E. of Bau, has several towns, among them Navathunimasi and Thava-kova. The reef on the N. side of Moaia is a collection of sunken and detached patches; that on the N. E. extends in the form of a bay; in the center there are several passages through the reef, quite safe with a favorable wind. Ovalau, a mountainous island about 20 m. from Bau, 8 m. long N. and S., and 7 m. broad, is of volcanic formation, and its rocks are composed of a conglo-
erato or pudding stone. The valleys extend only a short distance into the interior and have little level ground; they are exceedingly fertile, with a deep, rich soil, and well cultivated. Its harbors are all formed by the reefs. Levuka, a town on the E. side of the island, is chiefly inhabited by foreigners. It is the seat of the Feejeean government, the residence of foreign consuls, the principal shipping port, and has several hotels, churches, and stores. The metropolis of Feejee, containing upward of 1,000 inhabitants, is Bau, or Mban, on the small island of the same name, which is connected with the large island Viti Levu by a long flat of coral, fordable at high water, and in places bare at low water. Lakeba, or Lakea, is the principal island on the windward side of the group, 160 m. E. S. E. of Bau; the chief town is Tumon. Other inhabited islands are Beiti or Mhakiki, Beqa or Mban, Cakaudrove-i-wai or Thakauandrove, Cikobia or Thikombia, Kabora or Kambara, Komo, Macuata or Mathuata, Malolo, Nairai, Nayau, Ogea or Ongea, Onaeta, Rewa, Vannu Balavu or Mbalavu, Vulaga or Vulanga, often called Fulanga, and Yacata or Yathata.—From the meteorological register kept at Levuka by Col. W. J. Smythe, from January to the end of April, it appears that the maximum heat amounted on the 1st of January to 91° 9', and that the minimum temperature on the 8th of April was 72°. The average rain during these four months was 17.29 in.; thunder was heard almost daily, while the wind was generally very light. Thomas Williams places the mean temperature of the group at 80°. There is a large number of rainy days, but uninter rupted dry weather often continues for two or three months. Among the botanical productions are numerous varieties of the discoceras or yam, called seki; the balabala, a kind of palm or tree fern, of which the heart is eaten in times of scarcity; the bau, with an edible fruit and a beautiful brown or red wood, used for canoes and boxes; the bele, of which the leaves are cooked and eaten; the bokol, which has a fruit scarcely distinguishable from the kavika, a kind of Malay apple tree with a quince-like fruit; the bovu-dama, which furnishes a heavy timber of a light color; and the bulou, with a root resembling in taste an old potato. There is an elegant variety of fern called conini. The dali leaves spike-shaped flowers, and yields a hard and useful timber; but the most useful tree for canoe building, masts, and all kinds of carpentry, is the damanu. A fruit somewhat like a plum is borne by the dawa and the dawamol. Bread is made from the fruit of the dogo and the dogokana. The wood of the duva, pounded into fibres and fastened to a line, poisons or stupefies fish, which turn on their back as if they were dead, but soon recover when left to themselves. The fruit of the ivi is either baked or boiled, or grated and made into bread or pudding. The leaves of the dandani and the kusa are used medicinally. The smaller branches of the loselose are used by the natives as torches. But the most important of all the botanical productions is the cocoon tree, here called niu, almost every part of which is put to some use. Drums are made of the wood of the tavola; fans and umbrellas from the leaves of the viu, a kind of palm. A fruit very much like the raspberry is obtained from the wagadrogado. The root of the lagona (piper mythisticum) is chewed and mixed with water and drunk as a beverage. The bitu and the bituatu are kinds of bamboo which grow extensively. Cotton has succeeded admirably, and can be harvested within six months. Many of the colonists are planting coffee. Fishes are plentiful, including the porpoise, sole, mullet, and many other edible kinds; also a large shark, called mogo, and a still more dangerous fish called ogo. A kind of sea worm called babolo, found on some reefs toward the latter part of the year, is much esteemed by the natives as food. A maggot called yacato, which bores into wood, is much eaten on the poor islands. There are several kinds of oyster (cica), of which the large pearl shell is ground and used for ornaments. The coqu, a sacred bird, has a singular cry, much like a dog's or the human voice. There is a small bird somewhat like a corn-crake, called birds; a vampire bat, called brosa; a large sea gull, called kanaga; the kitn, a bird destructive to the sugar cane; the kulu, a species of red parrot, whose feathers are much valued for fringes of mats and personal ornaments; the sacred lawedu, a sea bird with two long feathers in its tail; owls, hawks, pigeons, &c. From a pair of horses introduced in 1861 all the mission stations have been supplied. Some islands of the group are much troubled with mosquitoes. The natives are above the middle height, sleek and portly, with stout limbs and short necks. They are of darker complexion than the copper-colored and lighter than the black races. Their hair is black, long, frizzled, and bushy, sometimes encroaching on the forehead and joined by whiskers to a thick round or pointed beard, to which moustaches are often added. They are almost free from tattooing; only the women are tattooed, and that on the parts of the body which are covered. The men dress in a sort of saah of white, brown, or figured mazi, using generally about six yards, though a wealthy man will wear one sometimes nearly 300 ft. long. The women wear a liku or fringed band, made of the bark of a tree, the fibre of a wild root, and some kinds of grass; the fringe is from 3 to 10 inches deep. The turban, worn only by the men of the respectable classes, is a fine masi of one thickness, and has a gauze-like appearance. They bore the lobe of the ear and distend the hole, and wear enormous ear ornaments. Both sexes paint their bodies, and seem to prefer red; they also besmear themselves with oil. The hair is the most important part of the toilet, and is dressed in gro-
FEEJEE ISLANDS

tese forms, sometimes attaining a diameter of 5 ft. The chief's barber is held in high respect, and his hands are not allowed to touch food. The hair is colored sometimes with two or more dyes. They are fond of music, and have invented the nose flute, the conch shell, the pandean pipes, a jew's harp made of a strip of bamboo, and several sorts of drums. The singing is invariably in a major key. The musicians perform on one note, the base alternating with the air; they then sound one of the common chords in the base clef without the alternation. The natives love to dance and are fond of poetry. Their verses occasionally rhyme, but seldom preserve a uniform measure. In chanting the chorus is repeated at the end of each line. Girls are betrothed at a very early age, and often to old men. Brothers and sisters, first cousins, fathers and sons-in-law, the supreme chief touches. He works sometimes at agricultural labor or plait sinnet. He has always several attendants about his person, who feed him and perform the most servile offices. He has no throne, but squats on the ground like his subjects. A peculiar language is used when speaking of the chief. All his actions and the members of his body are hyperbolized. Respect is indicated by the utterance of a peculiar shout or chant called tama; this is uttered by inferiors on approaching a chief or chief town. It is necessary to crouch when a chief passes by. Standing in the presence of the chief is not allowed, and all who move about the house in which he is creep, or, if on their feet, advance bent, as in act of obeisance. No one may cross a chief behind his back; the inferior must pass in front of the superior, and when at sea must not pass the canoe of a chief on the outrigger side. If a chief stumbles or falls, his subjects must do the same. The best produce of the gardens, the best animals, and the best fish are presented to the chiefs. Day of taxes is regarded as a high festival. Whale's teeth, women, and canoes are prominent articles of tribute. The criminality of an act is in inverse proportion to the rank of the offender. Murder by a chief is less heinous than petty larceny by a man of low rank. The most serious offences are theft, adultery, abduction, witchcraft, infringement of a taboo, disrespect to a chief, incendiaryism, and treason. Theft is punished by a fine, re-payment in kind, loss of a finger, or clubbing. The contumaciously are punished by a fine, or loss of a finger, ear, or nose. The other crimes are punished by death, the instrument being the club, noose, or musket. Adultery is the crime most severely visited. The adulterer may be put to death, or he may be compelled to give up his own wife to the aggrieved man, or his property may be destroyed or taken away from him. The principle of vicarious atonement is acknowledged. A man sentenced to death will often surrender his father to suffer in his stead. There is also a species of pecuniary atonement called soro, of which there are five varieties; the soro with a whale's tooth, a mat, club, musket, or other valuable, is the most common. Society is divided into six recognized classes: 1. kings and queens; 2. chiefs of large districts or islands; 3. chiefs of towns, priests, and ambassadors; 4. distinguished warriors of low birth, chiefs of the carpenters, and chiefs of the turtle catchers; 5. common people; 6. slaves by war. Rank is hereditary through the female line. The dignity of a pagan chief is estimated by the number of his wives. The rights of the eau, or sister's son, constitute one of the peculiar institutions of Feejee. A vas of rank can claim anything in his mother's land, excepting the wives, home, and land of a chief. In the moral and intellectual state of the Feejeeans there is a wide distinction between the pagan and Christian natives. As the majority are pagans, their customs, laws, and religion may
still be regarded as the national standards of Feejee. Capt. Wilkes says of them: "They are truly wretches in the strongest sense of the term, and degraded beyond the conception of civilized people." Strangulation of women, especially widows, infanticide, and other enormities prevail to a frightful extent. Foremost among their describable vices stands cannibalism; not only are prisoners taken in war consumed, but persons of the same tribe and village fall victims to the greed of their neighbors. The cooked human body is termed in the Feejee language bakolo or "long pig." As an English gentleman may send a choices hunch of venison as a present to another, so one Feejee chief will send a stalwart subject roasted entire like an ox, carefully trussed, and escorted by a procession to the residence of an ally. The epicures of Feejee prefer the flesh of women to that of men, and deem the thick of the arm and the thigh the tit-bits of the bakolo. The women are seldom allowed to taste it. The flesh of white men is held in low repute; it is said to be comparatively insipid or tainted with tobacco. A Feejeean is always armed, and war is the normal condition. The mountain fastnesses are well fortified with strong palisades and stone breastworks, pierced with loopholes. The arms chiefly used are clubs, spears, battle axes, the bow, the sling, and the musket. A peculiar weapon is the missile club, which is worn in the girdle, sometimes in pairs. It is a short stick, with a knob at one end, is hurled with great precision, and is a favorite weapon with assassins. The sick and aged request their sons to strangle them, or, if they are too slow to make this request, their sons suggest to them that they have lived long enough. To be strangled or buried alive by one's children is considered a most honorable death. They expect to be in the next world exactly as they were here, and affectionate children are unwilling to have their parents pass into the next world in an infirm state, and therefore strangle or bury them alive out of kindness. The relatives hold a wake over the intended victim while living, and anointed for the sepulchre, and go into mourning after the entombment. The signs of mourning are the cropping of the hair and the joints of the small toe or little finger. Another remarkable custom is the loloku or strangling of the wives and next friends of the deceased. Abortion is practised to a great extent by medicated waters or mechanical means. Boys are circumcised when from seven to twelve years old. The native religions are local; each island has its own gods, traditions, and superstitions. All the systems belong to the lowest types of polytheism, and all are impregnated with the filth and savageness which characterize the actual existence of the people. The mythologies have some features in common; they retain the distinction between divinares and divinares, between gods and demons. The latter class is made up chiefly of deceased animists and respected ancestors. Monsters and other objects of wonder are admissible to this class. Most of the gods are supposed to have jurisdiction only over the tribes, islands, or districts where they are worshipped. Each trade has its tutelary deities. The Feejeeans have no idols, but reverence certain stones as shrines of the god, and hold certain birds and fishes as sacred. Every Feejeean considers himself under the protection of some special god, and refrains from eating the animal which is his symbol. Each chief has his ambati, or priest, who acts in concert with him, and helps him govern his clansmen. The priests are known by an oval frontlet of scarlet feathers, and a long-toothed comb made of several pieces of wood fastened together with much ingenuity. There are priestesses, but few of sufficient importance to have a temple. The priests are consulted as oracles; the responses are given after convulsions, supposed to be caused by the presence of the god. There are various modes of divination, all of the most childish character, such as by biting a leaf or pouring water down the arm. They have a strong belief in all sorts of apparitions, witches, ghosts, wizards, and the evil eye. They believe in a sort of fairies who dance on the hills by moonlight and sing songs. The future world in their opinion is much the same as the present. But concerning the doctrines of the Feejeean religion it is scarcely possible to learn anything. The people know nothing, and the priests dislike to communicate their knowledge. Buroto is the name of their place of departed spirits, and is said to be a most delightful abode; but the Feejeeans believe that, except for great chiefs, it is very difficult to pass into it. The only way by which an inferior man can hope to gain admission is by telling a lie to the god, and proclaiming himself a chief with so much apparent truthfulness that he is allowed to enter. In a large number of the islands, a particular town in Vanua Levu is thought to be the entrance to the spirit world. The houses in this town are built with their doors opposite to each other, so that the shade may pass through without interruption. The inhabitants speak in low tones, and if at a little distance communicate their thoughts by signs. Sneezing is ominous, and varies in its luck, according as it proceeds from the right or left nostril. The temples, bure, or fully bure kaloo (anything wonderful, whether good or bad, is denoted by kaloo), are built on a mound of earth, and found in every village, and some of the villages have many of them. No labor is thought too great for the decoration of a bure. Their marvellous skill in palating sinnet is best shown in such a building; every beam, post, and pillar is entirely covered with the most beautiful patterns, chiefly in black and red; even large cords are made of sinnet and hung in festoons from the eaves. But these bures, though considered temples, are mostly used for secular purposes. Visitors are generally quartered in
them, and the principal men of the village often make the bure their sleeping place. When a chief wishes to propitiate a deity he offers a great quantity of food in his temple, and inviting his friends consumes it in a general feast. The Feejeean language belongs to the Oceanic or Malay-Polynesian type. The letters may be easily represented with the English alphabet, omitting ṭ, z, and ą. It has the same nine parts of speech as the English. The articles are ko or o, koi or oi, a or na, and ai or nai. All adjectives are used as abstract nouns, as vina, good, and also goodness; but the verbs are the most fruitful source of nouns. All nouns used without tagane, a male, or alesa, a female, are of common gender; also nouns of relationship, as tuena, a son or daughter, watina, a husband or wife. The number of nouns is shown by prefixing numerals, or by the personal pronoun used in relation to them. There are some nouns to express certain things by tens, hundreds, and thousands only. Case is shown by particles preceding the noun. Vako is a particle much used; it changes nouns into adjectives, as vaeva, the world, vaekavera, like the world; it changes adjectives into verbs, as vina, good, vaevina, well; with nouns it expresses the possession of the thing, as vale, a house, vaekavale, having a house; and it changes adjectives into verbs, and intransitive into transitive verbs. Some verbs have different terminations when affecting different objects, as vaevata na vaena, to sail to land, vaevata na vaega, to sail the canoe. There are many reduplicated forms of verbs. Repetition of words is used to a great extent, and implies either frequency or intensity: va vosa vosa vosa, talk, talk, talk, means always talking. Prepositions and conjunctions are few, but interjections are very numerous. Expletives, or ornamental particles, abound. Feejeean syntax is extremely simple. A profound confusion is also very easily obtained. The accent is invariably on the last syllable, or last but one. A different quantity often alters the sense of a Feejeean word. The Feejee group, which now contains, exclusive of coral islets, an area of about 6,500 square miles of dry land, is believed to have spread at the period when the correlagens began to grow over at least 15,000 square miles. Viti Levu and Vanua Levu are supposed to have formed a single island, which subsidence has separated by inundating the low intermediate area. The natives present a mixture of Papuan and Polynesian characters. Ethnology offers nothing of importance concerning them, for the Papuan race is one of the least known sections of mankind. The natives know nothing of former immigrations; they had no intercourse with other nations, excepting the Maoris. The belief is strong that they never occupied any country but the one where they now dwell. Even among the many independent states in the group there is little social and commercial communication, and no political connection. Intense quarrels and wars make up the history of the Feejees. The Dutch navigator Tasman saw the group on Feb. 6, 1643, and called it Prince William's islands, but effected no landing. On May 4, 1789, they were seen by Lient. William Bligh, in his long and perilous boat voyage after being turned adrift from the Bounty, who gave them his own name. The first settlement by Europeans was made by a party of escaped convicts from New South Wales in 1804. The American exploring expedition under Lieut. Wilkes, 1859-62, first excited the interest of civilized nations in the Feejee islands. The first British consul was appointed in 1868, and since then negotiations have been pending to put the group under the English government, on the suggestion of King Thakombau. But he was never king of Feejee, and he has long since lost the hold he formerly had upon the people and land. His reason for desiring to place the islands under British rule seems to have been merely to escape a claim on the part of an American citizen named Williams, whose house was accidentally burned, and who demanded an enormous sum for "destruction and spoliation of property." In 1869, 70 white residents petitioned the United States government to assume the dominion or protectorate of the islands. The white population having increased, a regular government was established in 1871, and a constitution adopted. This was subsequently abolished, and the government relapsed into barbarism. In 1874, partly owing to the wretched state of the finances, the sovereignty of Feejee was accepted by Great Britain. In 1885 two Wesleyan missionaries made the first attempt to introduce Christianity in Feejee; missionaries of other sects followed; and after the usual history of massacres and persecutions, the churches report a most wonderful success. There are said to be more than 900 church and preaching places, 1,500 day schools, a theological institute, and more than 100,000 attendants on public worship. See Wilkes's "United States Exploring Expedition around the World" (New York, 1856); Williams and Calvert's "Fiji and the Fijians" (London, 1858; revised ed., 1870); Mrs. Smythe's "Ten Months in the Fiji Islands" (London, 1864); the Rev. J. E. Wood's "Uncivilized Races of the World" (Hartford, 1870); and David Hazlewood's "Fijian and English Dictionary," containing brief hints on native customs, &c. (London, 1872).

FEETH. See FEITH.
One of his finest tragedies is *Ines de Castro* (1798), and his most finished prose writings are *Brieven over verschillen onderwerpen* (6 vols., 1784-94). A complete edition of his works was published soon after his death (11 vols., Rotterdam, 1824).

**FELANITX**, or *Felaniche*, a town of Spain, on the island of Majorca, 25 m. E. S. E. of Palma; pop. about 8,000. It is in a fertile valley surrounded by mountains, and contains spacious streets and six squares. There is an ancient Moorish castle, with a subterranean vault, on the adjoining mountain of San Salvador de Felanitx. An active trade is carried on in cattle, wine, fruit, and colonial produce. Linen and woollen goods and other articles are manufactured. The place is of great antiquity. The neighboring mountains abound with Moorish remains.

**FELDKIRCH**, a town of Austria, in Vorarlberg, on the Ill, and on the railway leading from the Tyrol into Switzerland, 20 m. S. S. W. of Bregenz; pop. 3,000. It is the seat of a vicar general who has jurisdiction over all the churches of Vorarlberg, and of a Jesuit college which has a large number of pupils from Austria, Germany, and other countries. It has cotton mills, machine and fire engine factories, a bell foundry, tile works, manufactories of articles of wood, distilleries of *Kirschewasser*, and an extensive trade.

**FELDSPAR** (Ger. *Feldspath*, from *Feld* field, and *Spat* spar), a species of aluminous minerals very abundantly distributed, principally in plutonic and volcanic rocks, as granite, gneiss, greenstone, and trachyte. The different species were formerly confounded, but they are now distinctly classified, not only by the different crystalline forms which they present, but, when these are the same, by distinct chemical composition. The feldspars are in all cases anhydrous double silicates, consisting of a silicate of alumina combined with a silicate of some one or more of the protoxides of potash, soda, lithia, baryta, or lime. The proportion between the aluminous or sesquioxide base and the protoxide bases is constant, being one equivalent of each, making the oxygen ratio 1 to 3; but the proportion of silica varies, causing considerable variation in the density and hardness. The amount of silica corresponds much to that in the rock in which the feldspar is found, and to the minerals associated with it, the more highly silicatized kinds occurring in granite, and the less silicatized in basalts. When a granite has large crystals of feldspar disseminated through it, it is called porphyritic granite, and sometimes porphyry, particularly when the proportion of feldspar is large. The various species of feldspar are given in the following table, as classified by Prof. Dana, with their systems of crystallization, and also their composition as indicated by the oxygen ratios of constituents; the first column of figures showing the protoxide, and the second the aluminous base, while the last column gives the proportion of silica according to the same ratio:

All the feldspars may be fused before the blow-pipe, with more or less difficulty, to a vitreous enamel, and this property causes them to be extensively used for glazing porcelain. The crystals of the several varieties range in hardness from 6 to 7 upon a scale of 10, being harder than glass, but less so than quartz. Their specific gravity varies from 2.6 in orthoclase to 2.7 in labradorite. The crystals of some species exhibit a beautiful play of colors; labradorite, the lime-soda feldspar, first discovered by the Moravian missionaries on the shores of St. Paul's i.e. off the coast of Labrador, being the most beautiful. The splendid opalescent and chatoyant reflections of this mineral have made it much prized as an article of jewelry. The cause of the play of colors has been satisfactorily explained by Reusch, who finds a cleavage structure of extreme delicacy transverse to the median section. He therefore regards the color as that of thin plates, produced by the interference of the rays of light. The more common feldspars are orthoclase, or common potash feldspar, and albite, or soda feldspar. The potash species is the one most frequently met with, and is the usual associate of mica and quartz in ordinary granite, and of hornblende and quartz in syenitic granite. Fine crystals of orthoclase are found at Carlsbad and Elmogen in Bohemia; at St. Agnes in Cornwall; in the Mounts mountains in Ireland, associated with beryl and topaz; in great abundance in trachyte at Drachenfels, on the Rhine; and also in the lavas of Vesuvius, in the valley called Fossa Grande. In the United States, it is found at Mt. Desert on the coast of Maine, of a fine green; in Massachusetts, at South Royalton and Barre, in large crystals; in Connecticut, in the gneiss quarries at Haddam, and the feldspar quarries at Middletown, in crystals a foot long and from 6 to 8 in. thick; in New York, at Potsdam, St. Lawrence co., in crystals a foot thick, at Warwick, Orange co., associated with tourmaline and zircon, and in many other places. The formula of orthoclase is *K₂O, Al₂O₃, 8SiO₂*. The old formula, regarding silica as *SiO₂*, and using the small atomic weight of oxygen, is *K₂O₈, Al₂O₈, SiO₂*. Albite, or cleavelandite, the soda feldspar, often replaces orthoclase as a constituent of granite, and in some instances is associated with it, as in Pompey's pillar, when it generally has a whiter color. Veins of albite
granite often contain the rarer granite minerals, such as beryl and tourmaline. In its compact state as felsite, it is the base of albite porphyry. It is found in Maine, at Paris, with red and blue tourmaline; in Massachusetts, at Chesterfield; in Connecticut, at Hadham, with beryl, columbite, and black tourmaline, and in other localities; in New York, at Granville, Washington co., in white transparent crystals; in Pennsylvania, at Unionville, Delaware co., where a granular variety is a matrix for corundum; and in Calaveras co., California, with native gold and auriferous pyrites. Albite has the same composition as that of orthoclase or potash feldspar, substituting soda in place of potash. Soda feldspars yield more rapidly than potash feldspars to the decomposing action of water and carbonic acid; and accordingly Prof. T. Sterry Hunt finds in the more recent crystalline rocks of Canada a less development of soda feldspar than of any other kind, and conceives the carbonate of sodium resulting from the decomposition of the albite and similar minerals of the older rocks to have reacted with the chloride of calcium of the paleozoic ocean, producing deposits of carbonate of calcium and the chloride of sodium which is held in solution. In general, the decomposition of the feldspathic rocks has furnished the principal mass of the various clays, those containing the largest proportion of feldspar affording the finest deposits, such as kaolin, of which porcelain is made. The soil derived from them, particularly the common potash species, is noted for its fertility when under good cultivation, on account of their furnishing a large supply of potash, an important constituent of plants. The application of caustic lime to such soils, when they are worn, has the effect of liberating a portion of the potash, with the formation of silicate of lime; this accounts for the great difference often noticed in the fertilizing effects of the application of lime, depending upon the mineral character of the soil and upon the condition of the lime.

**FLEGHYÁZA**

or **Flegyáza**, a town of Hungary, in the district of Little Cumania, 65 m. S.E. of Pesth; pop. in 1870, 21,313. It is situated in an exceedingly fertile region, and contains a large Roman Catholic parish church, a gymnasion, and a fine town hall. The principal products of the vicinity are grain, fruit, tobacco, and wine, which is made in great quantities. There are four annual cattle fairs, which are much frequented.

**FELICIE, Fortunato Bartolomeo**, an Italian author, born in Rome about 1736, died at Yverdun, Switzerland, Feb. 7, 1789. He studied under the direction of the Jesuits, and became a teacher of various sciences in Rome and in Naples. His abduction of a nun from a convent in the latter country obtained his banishment from society, and about 1756 he settled in Brussels and became a Protestant. At a later period he founded a printing establishment and a boarding school at Yverdun. He translated into Italian the works of Descartes, D'Alembert, and Newton, and edited with Tscharner the *Principe du droit naturel et des gens*, and published an abridgment of the same under the title of *Leges du droit de la nature et des gens* (4 vols., Yverdun, 1769), and many other works. His most extensive production is the *Encyclopédie, ou Dictionnaire universel des connaissances humaines* (48 vols. 4to, and 10 vols. of illustrations, 1770-'80). It was based on Diderot's cyclopedia, and he was assisted by Euler, Haller, and other eminent scholars. From this he compiled a *Dictionnaire de la justice naturelle et civile* (18 vols., 1778).

**FELIX**, called **Felix of Valois**, a saint of the Roman Catholic church, and founder (with John of Matha) of the order of Trinitarians, born in the district of Valois, France, April 19, 1127, died in the monastery of Cerrfoi, Nov. 4, 1212. He was a man of considerable wealth, which he renounced to become a hermit in the forest of Galeresse, diocese of Meaux, where he dwelt until his 60th year. About that time John of Matha became his disciple, and inspired him with the idea of devoting his remaining years to the labor of redeeming the Christians held in bondage by the Mohammedans. For this purpose they both went to Rome in 1197 and submitted their design to Pope Innocent III. He approved it, and in furtherance of it a new religious order was established, styled the "order of the Trinity," or "for the redemption of captives," John of Matha being appointed its "minister general." Returning to France, they established a monastery in Cerrfoi, which became the cradle of the order of Trinitarians. While John of Matha journeyed to Italy and Africa, Felix governed and propagated the new order. He obtained for it an establishment in Paris, near a chapel dedicated to St. Mathurin, and from this circumstance his monsigners were there called les Mathurines. The order established by him is called indiscriminately Trinitarians or Redemptionists.—See for his biography Beillet, *Vies des saints*, under date of Nov. 20, and Richard and Giraud, *Bibliothèque sacrée*.

**FÉLIX, Clément Joseph**, a French preacher, born at Neuville-sur-l'Escuas, near Valenciennes, June 28, 1810. He studied at Cambrai, and after his ordination was employed there in pastoral duties. He entered the novitiate of the Jesuits in 1837, and was appointed professor of rhetoric in the college of Bruges. While there a discourse delivered by him at an academic celebration caused his superiors to employ him exclusively in the ministry of preaching. He went to Paris, heard the best speakers of the bar, the pulpit, and the legislature, preached his first course of Advent sermons in the church of St. Thomas d'Aquin in 1851, and the Lenten course in St. Germain des Prés in 1852. In 1853, he succeeded Lacordaire and Ravigan in the pulpit.
of Notre Dame; and from that year until 1869 he held that post. He was superior of his order in Nancy, when in June, 1871, he was appointed superior of the Jesuit residence in the rue de Sèvres, Paris, in place of Père Ollivaint, killed during the commune. His sermons have been published under the title of *Le progrès par le Christianisme: Conférences de Notre-Dame* (13 vols. 8vo, Paris, 1856-69).

**FELLAHS** (Arab. *fallah*, a cultivator), a term applied without distinction to all the peasantry in Syria, Arabia, and Egypt. Of the various races which exist in Egypt the Fellahs are the most ancient, and are probably mainly the descendants of the old Egyptians. They still present a physiognomy resembling that which is found upon ancient Egyptian sculptures. A patient and laborious population, they have held for ages the soil which the Nile fertilizes. They are generally of large stature, with broad chests, muscular limbs, and black and piercing eyes. The conformation of the brain indicates an intelligent race, the facial angle being usually almost a right angle, though within the Delta the Arab type of countenance predominates. The antique Egyptian type reappears most strikingly in the women, who, though slender and graceful, are remarkably strong. The dress of the Fellahs indicates misery and privation, being rarely more than a shirt, leaving bare the arms, legs, and breast. Their ordinary nourishment is coarse bread, water, and onions, to which they are sometimes able to add cheese, dates, beans, or rice. They live in huts about four feet high, the only furniture of which is a mat on which to sleep, a water jug, and a few kitchen utensils. They remain attached to the rudest agricultural methods, and use almost the same implements as their remote ancestors; yet the fruitfulness of the soil compensates for their lack of skill. Mehemet Ali failed in his efforts to introduce among them the implements of modern invention. They are able to endure the greatest fatigue, and to work through the whole day in a burning climate with very little food, accompanying their labors with songs. The women share the heaviest labors of the men. — The Fellahs in Palestine are addicted to theft and robbery, and are averse to work unless compelled by necessity. This arises partly from their natural indolence, and partly from the exactions of an arbitrary government, which views with distrust any acquisition of wealth. They are generally in debt to usurers, who lend them money at a ruinous rate of interest.

**FELLENBERG.** See Foolahs.

**FELLENBERG, Philipp Emanuel von,** a Swiss educator and philanthropist, founder of the institutions at Hofwyl, born in Bern, June 27, 1771, died there, Nov. 21, 1844. His father was a member of the government and a friend of Pestalozzi. His mother was a descendant of the Dutch admiral Van Tromp. He studied at Colmar and Tübingen, and travelled extensively with a view of familiarizing himself with the condition of the working and suffering classes. He was at Paris shortly after the fall of Robespierre, and there his early convictions became strengthened that improved systems of education alone can protect society against revolutions. Returning to Switzerland after taking part against the French, he was exiled when they had succeeded in taking Bern, and went to Germany, where he resided some time. After his return to Switzerland he was employed by the government in a mission to Paris, and in high military and political functions at home. Finding that nothing would be done by the government for the accomplishment of his favorite educational projects, he resolved to devote his large fortune to the purchase of the estate of Hofwyl near Bern, and to the establishment of model institutions in accordance with the views of Pestalozzi. Fellenberg's aim was to elevate all classes by opening an institution alike to the poor and the rich, and by not only making agriculture the basis of his instruction, but also elevating that profession to the dignity of a science. Apart from the agricultural school, he founded an establishment for the manufacture of improved agricultural implements. At the same time he laid the foundation of a scientific institution, for which the first building was erected in 1807. The agricultural institution was opened in 1808, and he established in the same year a normal school, which became popular among the teachers in Switzerland, and grew in importance as its advantages became known abroad. The institution was gradually enlarged, and comprised altogether seven distinct schools, to each of which a primary school was added in 1880,
and still another school for children at a subsequent period. By these schools, and by his writings on the subject of agriculture and education, Fellenberg exerted a remarkable influence in Europe, and although the institutions which he founded were dissolved after his death, after having been conducted for several years by one of his sons, kindreded institutions have sprung up in Switzerland and Germany, and the celebrated pauper colony of the Netherlands at Frederiksoord, province of Drenthe, was founded in 1818 by a pupil of Hofwyl. Fellenberg was assisted in his benevolent labors by his wife, and by the greater number of their nine children.—See Hamm, "Fellenberg's Leben und Wirken" (Bern, 1845). Robert Dale Owen was a pupil at Hofwyl, and in his autobiography ("Threading his Way," 1874) has given an interesting account of the school.

FELE, François Xavier de, a Belgian author, born in Brussels, Aug. 18, 1785, died in Ratisbon, May 21, 1802. He was educated in the Jesuit colleges at Luxembourg and Rheims, and after becoming a member of their order was employed as professor at Luxembourg and Liége. He went afterward to Transylvania in Hungary, and after passing some time there, he travelled extensively in Hungary, Austria, Bohemia, Poland, and Italy. He was preacher in the college of Liége when the order of Jesuits was suppressed in Belgium in 1778, and afterward devoted himself to literature. Being compelled to leave Belgium at the occupation of that country by France in 1794, he spent two years at Paderborn, and subsequently retired to Ratisbon. Among his works are Observations philosophiques sur le système de Newton (3d and enlarged ed., Liége, 1778), and Catechisme philosophique (4th ed., 1808; new ed., from the author's annotations, Lyons, 1819). He left many other writings, chiefly on religious subjects; but his principal work is his Biographie universelle, ou Dictionnaire historique, &c., which passed through many editions, and after his death was revised and continued under the direction of M. Charles Weis and the abbé Busson, and brought down to 1848 (9 vols. Svo, Paris, 1847–56).

FELO, Robert, an English author, born in Norfolk in 1770, died in 1847. He graduated at St. Mary's hall, Oxford, and in 1795 took holy orders, but subsequently rejected the doctrines of the established church, and adopted the opinions which are given at length in his "Religion of the Universe," published in London in 1886. He had previously published "A Picture of Christian Philosophy" (Svo, London, 1800); "Religion without Cant" (1801); "The Guide to Immortality" (3 vols., 1806); "A Manual of Piety, adapted to the Wants and Distresses of All Sects of Christians" (1807); "A Body of Theology, principally practical, in a Series of Lectures" (2 vols., 1807), &c. Mr. Fellows was an intimate friend of Dr. Parr and Baron Masères, the latter of whom left him the greater part of his large fortune, to be dispensed in literary and benevolent enterprises. He was one of the earliest advocates of the establishment of the university of London, of which he was a frequent and liberal benefactor.

FELOWES, Sir Charles, an English traveller and archaeologist, born in Nottingham in 1799, died Nov. 8, 1860. He published a "Journal written during an Excursion in Asia Minor" (Svo, London, 1839), in which he gave descriptions of the superb architectural and sculptural remains of the cities of Xanthus and Tlos. The interest excited by the work induced the government to apply to the Porte for a firman, authorizing the removal of specimens of the ancient works of art described by Mr. Fellows, who departed on a second tour through Lycia, in the course of which he discovered 13 other ruined cities. Having learned that the Porte declined to grant the firman, he returned to England, and published "An Account of Discoveries in Lycia, being a Journal kept during a Second Excursion in Asia Minor" (Svo, 1841). The government were at last successful in procuring the desired firman, and a new expedition succeeded in transporting to England a number of cases of sculptures, which are now deposited in the "Lycian Saloon" of the British museum. Another expedition, also under the direction of Mr. Fellows, brought a number of additional marbles to England in 1844. For these services he received in 1845 the honor of knighthood. His remaining publications are: "Account of the Xanthian Marbles in the British Museum" (1843), a pamphlet written to correct some misstatements; "Account of the Trophy Monument at Xanthus" (1844); and "Coins of Ancient Lycia" (1855).

FELO DE SE, one who commits felony against or upon himself. As felony is, in common law language, any capital offence, a murderer is the only capital offence which a man can commit against himself, a felo de se is a self-murderer, or one who kills himself with malice aforethought. Indeed, the legal definition of a felo de se (or suicide) is said to include the doing of any unlawful and malicious act, although aimed primarily against another, whereby death ensues to the guilty person. In England this crime was punished not only with forfeiture of goods and chattels, like other felonies, but, to mark the detestation of the law, and to deter others from a similar crime, the body was treated ignominiously, and buried in the open highway with a stake thrust through it. This very ancient rule fell into general if not entire disuse in England many years ago, but it was not repealed until the statute 3 George IV., c. 51; and even then, to manifest the horror of the act, it was ordered that the body (which might be placed in a churchyard or other consecrated ground) should be buried at night, and without the performance of religious rites. (See
FELONY

Blackstone's Commentaries, vol. iv., p. 190.) Suicide does not seem ever to have been made punishable as a crime by any statutory provisions of the United States; nor are we aware that the barbarous usages of England in relation to the burial of the corpse were ever practised here. It is held at the common law that if one encourage and assist another in the commission of suicide, he is guilty of murder as a principal.

FELONY. The origin and the exact meaning of this common-law term are both uncertain. There is about equally good authority for deriving it from the Saxon words feol, fee, and iol, price or pay, when its primary sense would be forfeiture or loss of fee; or from a single word feolen, to fail or fall, when its meaning might be the failing of the guilty party into crime, or the falling of his land into the hands of his lord by forfeiture. It seems quite certain that in England, from the earliest times, felony was always attended by absolute forfeiture of land or of goods, or of both; and the definition of Blackstone (4 Bl. Com. 85) is, in accordance with this principle: “An offence which occasions a total forfeiture of lands or goods, or both, at the common law, and to which capital or other punishment may be superadded, according to the degree of guilt.” But we understand Blackstone to mean, generally, by felony, all capital crimes below treason (p. 89); and Coke says (1 Inst. 15) that treason itself was anciently included within the meaning of felony. In those distant ages a felon was to be punished: 1. by loss of life; 2. by loss of land; 3. by loss of goods; 4. by loss of blood, or attainder, under which he could have no heir, and none could ever claim through him. In more recent times felony meant in practice any crime punishable with death; and therefore when a statute declared any offence to be felony, it became at once punishable with death; and vice versa, a crime which is made punishable with death becomes thereby a felony. Even in early times felony was sometimes defined as any capital crime; although it is said that before the reign of Henry I. felonies were punished only by pecuniary mulct or fine, and that sovereign having about 1108 ordered those guilty of felony to be hanged, this has since been the law of England. (Tomlin’s “Law Dictionary,” word “Felony.”) It cannot be doubted, however, that at common law the forfeiture incurred by the crime was the essence and the test of felony. In the United States there is little or no forfeiture for crime (see FORFEITURE); and in England capital offences are far less numerous than formerly. It may be said that in the United States the word, so far as it has any definite meaning, signifies a crime punishable with death or imprisonment. The statutes of some of the states define it as any offence punishable to a certain extent, as by death or confinement in the state prison or penitentiary.

FELT. A fabric of wool or fur, separate or mixed, manufactured by matting the fibres together without spinning or weaving. The fur of the beaver, hare, rabbit, and seal, camel's and goat's hair, and the wool of the sheep, are well adapted for this process. Felt is an ancient manufacture, supposed by Pliny to have been produced before woven cloth. It is probably the same as the lana coaca anciently used for the cloaks of soldiers, and by the Cæsærianians for hats. Early in the present century a piece of ancient felt was discovered with some other stuffs in a tomb at St. Germain des Prés, and a paper relating to them was presented by Desmarest in 1806 to the academy of sciences.—The production of a fabric from the loose fibres results from the tendency these have from their barbed structure to work together when rubbed, each fibre moving forward in the direction of its larger end without a possibility of moving in the other direction. This peculiar structure of the animal fibre, so different from that of the vegetable fibres, is readily perceived on drawing a filament of wool through the fingers, holding it first by one end and then by the other. Examined through a powerful microscope, the short fibre exhibits the appearance of a continuous vegetable growth with numerous sprouts, all pointing toward the smaller end. In a filament of merino wool as many as 2,400 of these projections or teeth have been found in a single inch; and in one of Saxony wool of superior felted quality there were 2,700 serrations in the same space. Southdown wool, which is not so much esteemed for this use, contained only 2,080 serrations in one inch; and Leicester wool, which is not at all adapted for felting, only 1,860. The short curly fibres of wool, freed from grease and brought together, intertwine at once very closely and form a compact mass. By rubbing this with the hands, and moistening it with some soapy liquid, the matter is made more dense according to the pressure with which it is rubbed. At last the fibres can go no further without danger of fracture, and the fabric becomes hard and stiff. It may, however, be made thicker to any desired extent by adding more fibres and rubbing these in by separate
layers. Drugget is a variety of felt in which machinery is made to agitate and work the fibres of wool together. A coarse variety of felt cloth has of late years been introduced, in the manufacture of which improvements have been made greatly facilitating the process.—The method of making felt will be more particularly noticed in the article Hat.

FELTHAM, or Feltham, Owen, an English author, died about 1860. No event of his life is known except that he resided for many years in the house of the earl of Thomond. He wrote "Resolves, Divine, Political, and Moral" (3d, and 1st complete ed., 1693; 10th ed., 1677), which has been highly admired for its exuberance of wit and fancy, fervent piety, and occasional subtlety of thought. Feltham is the author also of a few minor pieces in prose and verse.

FELTON, Cornelius Conway, an American scholar and writer, born at Newbury, Mass., Nov. 6, 1807, died at Chester, Pa., Feb. 26, 1882. He graduated at Harvard college in 1827. While in college he was distinguished for his literary tastes, and the wide range of his studies. He supported himself to some extent by teaching in Concord and Boston, and in the Round Hill school at Northampton, Mass. In his senior year he was one of the conductors of the "Harvard Register," a students' periodical. After leaving college he was engaged for two years, in conjunction with two of his classmates, in the charge of the Livingston high school in Geneseo, N. Y. He was appointed Latin tutor in Harvard college in 1829, Greek tutor in the following year, college professor of Greek in 1832, and Eliot professor of Greek literature in 1834. In addition to the duties of this professorship he filled for many years the office of regent of the college. In 1833 he published an edition of Homer, with English notes and Plaxman's illustrations, which has since passed through several editions, with revisions and emendations. In 1840 a translation by him of Menzel's work on "German Literature," in three volumes, was published among Ripley's "Specimens of Foreign Literature." In the same year appeared his "Greek Reader," containing selections in prose and verse from Greek authors, with English notes and a vocabulary; this has since been frequently reprinted. In 1841 he published an edition of the "Odes" of Aristophanes, with an introduction and notes; since revised and republished in England. In 1848 he aided Professors Sears and Edwards in the preparation of a work on classical studies, containing essays on classical subjects, mostly translated from the German. He assisted Longfellow in the preparation of the "Poets and Translators," which appeared in 1845. In 1847 editions of the "Panathenaius" of Isocrates and of the "Agamemnon" of Aeschylus, with introductions and English notes, were published by him; a second edition of the former appeared in 1854, and of the latter in 1859. In 1849 he translated from the French the work of Prof. Guyot on physical geography, called "The Earth and Man;" and in the same year he published an edition of the "Birds" of Aristophanes, with an introduction and English notes, which was republished in England. In 1852 he edited a selection from the writings of Prof. Popkin, his predecessor in the Eliot professorship, with an introductory biographical notice. In the same year he published a volume of selections from the Greek historians, arranged in the order of events. The period from April, 1859, to May, 1854, was spent by him in a European tour, in the course of which he visited Great Britain, France, Germany, Switzerland, Italy, and Greece; giving about five months to the last named country, visiting its most interesting localities, and carefully studying its architectural remains. In 1855 he revised for publication in the United States Smith's "History of Greece," adding a preface, notes, and a continuation from the Roman conquest to the present time. In the same year an edition of Lord Carlyle's "Diary in Turkish and Greek Waters" was prepared by him for the American press, with notes, illustrations, and a preface. In 1856 he published a collection from modern Greek writers in prose and verse. Besides the above, he compiled an elementary work on Greek and Roman metres, and wrote a life of Gen. Eaton for Sparks's "American Biography," and also various occasional addresses, and numerous contributions to the "North American Review," "Christian Examiner," and other periodical publications. He delivered four courses of lectures before the Lowell institute in Boston, on subjects connected with the history and literature of Greece. He wrote the articles on Agassiz, Athens, Attica, Demosthenes, Euripides, Greece, and Homer for the first edition of this Cyclopaedia. He was a member of the Massachusetts board of education, and one of the regents of the Smithsonian institution. In the summer of 1858 he made a second visit to Europe, partly on account of impaired health, and partly to complete some investigations into the language, topography, education, &c., of Greece. An account of this visit was given in his "Familiar Letters from Europe," published after his death (Boston, 1884). In 1860, on the resignation of President Walker, he was elected president of Harvard college. His most important work, "Greece, Ancient and Modern," was published posthumously in 1867 (2 vols. 8vo); it was made up chiefly from his lectures before the Lowell institute.
ed in the 15th century by Father Bernardini, is regarded as the oldest establishment of the kind in Europe. Wax bleaching and silk weaving are the principal branches of industry, and there is a brisk trade in wine, silk, and oil. The former sea of Feltre has been united with that of Belluno, but the town is still the seat of a vicar apostolic. Marshal Clarke, one of Napoleon's generals, derived his ducal title from this place.

**FEMERN, Fehmarn, or Fehmarn**, an island of Prussia, in the province of Schleswig-Holstein, separated from Holstein by the Fehmarn sound, and from the Danish island of Lolland by the Fehmarn belt, 37 m. E. N. of Kiel; area, about 70 sq. m.; pop. about 10,000. It is accessible only to small boats, owing to the shallowness of the sea. The principal products are grain and peas. There is an active trade in woollen hosiery, and a number of the inhabitants are also engaged in fishing. Capital, Burg or Borg.—Femern was taken in 1429 by King Eric of Denmark, who had set all the young women slain on the so-called Maiden mountain, near the village of Petersdorf. It was recovered by the duke of Holstein in 1426. The treaty of Flensburg, 1580, gave the island to the Gottorp line of dukes, with whom it passed to Denmark two centuries afterward. Femern was taken by Prussia in March, 1864, during the war with Denmark.

**FENCING**, the art of attack and defence with any weapon but such as cut or break by sheer force. The word is, however, understood to allude especially to the management of the small sword or rapier, and when any other arm, such as broadsword, bayonet, or stick, is used, the kind of weapon is specified. Fencing was cultivated by the ancients, as shown by the Roman gladiators. During the period when suits of armor were worn by combatants, battle axes and other ponderous weapons were much adopted, and fencing fell into disuse. When, however, metal casing was abandoned, it came again into vogue. The peculiar state of society existing in Italy in the 16th century made such knowledge more needed there than elsewhere; consequently the Italians became the most expert fencers of that epoch, and were the teachers of the art to other nations. The next country which found the art to be a necessity was Spain, whither it was imported from Italy. There the art was improved, and the amendments were accepted by the Italians. From Italy fencing was also imported into France, where the court and gentry favored it so much that it quickly took a fresh development, and a new school was established.—Though the principal object in studying the art of fencing is to enable men to wield arms with skill, it is a hint that has been generally by many persons, a recreation and an exercise. While it demands no violent straining of the muscles, it develops in an extraordinary degree the whole physique, and imparts the most perfect delicacy of touch, with steadiness and lightness of hand.—The fundamental principle upon which is based the defence of the person by means of the small sword is a peculiar application of the power of the lever, whereby the fencer who parries an attack causes the point of his adversary's blade to deviate from the direct course, and throws it aside from his body by pressing or striking the faible (part near the point) of his adversary's weapon by the forte (part near the handle) of his own. The surface of the front of the body is, in fencing language, divided by an imaginary line, horizontal, and just below the breast, separating the upper from the lower portion; the upper part is again subdivided by a perpendicular line, the right of which is termed the outside, the left the inside. There were in the old school eight parries, distinguished by the Italian numerals primo, secondo, terzo, quarto, &c., from which are taken the modern terms prime, second, tierce, carte, &c. The instrument adopted for exercise is called a foil; it has a handle similar to the small sword, which is intended to represent; it has a guard of metal or leather between the handle and the blade, which blade is of pliant steel, having at the end a button in place of a point. The parries are made with the weapon itself; the upper part of the body to the right is defended by the parry termed tierce, the upper part to the left by that termed carte, and the lower line by secondo. Of the old parries these are the chief; indeed the others are nearly obsolete, or used only in certain exceptional cases. When the fencer is left-handed, the left of his person instead of the right is most exposed to his adversary, and the parries of carte and tierce are reversed. The fencer is expected to depend upon his sword hand for protection, rather than upon his agility of leg; nevertheless he must be quick and active on his legs to be able to advance, retreat, or lungé. Thrusts are directed solely at the body; a hit upon a limb can only be accidental, and in a fencing school will not be counted as a hit. An attack or a riposte may be made by the mere extension of the arm, or accompanied by a lunge, that is, by advancing the body, stepping forward with the right foot without moving the left one. An engagement means the crossing of the blades. A riposte means the attack without pause by the fencer to the right or left was also called into requisition in avoiding an attack. But since the habit of wearing the dagger and mantlet has been abandoned, and the velocity of attack and riposte has become so great that the dagger is no longer used, and the mantlet no longer exists, the shifting of the position would be fatal to him who relied upon it, the instruction in defence has been confined solely to the foil. The Italian foil is long, some 38 to 40 in.; the ancient was longer than the more modern.
The Italian is also much heavier and less pliant than the French foil, which is only 34 in. in length. The handle has just over the guard a ring in which the fencer inserts his fore and middle fingers to grasp firmly the weapon, which is further secured to the hand by a bandage; whereas the French use neither the ring nor the bandage. The guard to protect the hand is of metal in the Italian foil, and very large; in the French foil it is much smaller and lighter. The pure Italian school is in vogue only in lower Italy and Sicily, and the Neapolitan masters are justly celebrated for their adroitness in this particular method. The characteristic of the Neapolitan school (which more than any other partakes of the old Italian and Spanish) is to extend the arm so constantly to present the point direct to the adversary’s breast; the hand is kept in the centre of the person at nearly the elevation of the shoulder; the large guard between the handle and the blade serves to prevent the puncture of a little shield by causing the attacking point to glance off the hand of the fencer on the defensive, slightly bearing to the left or right (carte or tierce), according as he finds himself menaced. The arm being already fully extended has the tendency to keep an adversary at a distance, and also facilitates the lunge of the attacker. The fencer can also defend himself by a circle parry, which the Neapolitan makes by describing with the point a small circle 8 to 13 in. in diameter, for the purpose of catching up an adversary’s point which may glide away from the engagement under the blade, menacing the lower line, or the upper one if it complete the disengagement. The Venetian school, of those of upper Italy, resembles most the Neapolitan; the Piedmontese is mixed, partaking of the old French and the Neapolitan. The Spanish school is a modification of the Neapolitan, in which the attack is assisted by extraordinary gymnastics of the leg, the fencer at times throwing himself nearly on the ground and attacking much in the lower line. This, like every other peculiarity, when well executed, is very embarrassing to one not accustomed to it.—When the French established a method of their own, the deviation from the Italian model consisted in the fencer having a less extended sword arm, the hand (medium guard) at the height of the breast, the elbow slightly bent, and the point of the sword at about the height of the eye. The knees were a little more bent, but the body was kept back as if to get out of reach of attack. Among the additions to the defence may be especially noted the half circle (old style), having the hand about level with the shoulder and the point depressed to the height of the waist, protecting the lower line to the left (carte), and being consequently the opposite of seconde, which bore the adversary’s blade to the right. A new mode of attack was also introduced, termed coupé, or the cutting over the point instead of disengaging under the blade. Here were also introduced the battement or sharp tap preceding an attack, the effect of which is to make the person thus attacked grasp his foil most tightly and thus render his hand for the moment rigid and unfitted to parry with rapidity. The change of engagement has much the same effect. Some disarms were introduced, but they are practically useless except when the hit is given by the same blow, for an adversary who is seen to be disarmed cannot be touched. Lafaugère introduced the couvraiment, which was made by raising the hand instantly after the parry (carte or tierce), and with the forte of one’s own blade mastering the faible of the adversary’s, then (as the latter in this situation tries to close the line of the riposte) turning or sliding the blade round it without quitting it, and delivering the riposte in the opposite line to that of the parry. The half-circle parry of Bertrand is made with the nails upward, the hand at the height and to the right of the forehead, the arm more than half extended, the point very slightly depressed and projecting leftward about as far as the line of the left shoulder, rather but not completely in the direction of the adversary. The blade in this parry catches up the attacking foil and exposes the entire body of the attacker to a riposte, which comes with incredible velocity, the point after the half-circle parry being very near to the breast of the opponent.—The instruction for the small sword is the basis of the attack and defence with every other weapon; nevertheless almost every attack and parry with the broadsword is the reverse of those with the small sword. Instead of having the point further out than the hand on the side of the guard, the blade is kept across the body; instead of the touch being the guide, the eye principally directs the movements; instead of piercing with the point, the hit consists of a cut with the blade. The cut can be given as a blow, or with a light hand, which makes it razor fashion. There are also circle parries called moulinets, whereby the man who parries swings round his sword, describing a complete circle with the point, and having his own wrist as the pivot for the movement. The use of the broadsword on horseback is but a variation of its application by a combatant on foot; the horseman is obliged to protect his horse as well as himself. Heavy cavalry are armed with long heavy swords, and hit heavily. The Turks have curved scimitars and adopt the razor cut; they also use swords weighted at the extremity, whereby they combine together the blow and the razor cut. The Germans have a long sword which they (students especially) manœuvre with an extended arm; it may be regarded as the Neapolitan school applied to the broadsword. The bayonet at the end of the musket is, when employed by a line of soldiers, a very formidable weapon; but on account of the leverage it offers it is of little use to an isolated man, unless to defend himself against a mounted dragon. The motion of the bayonets in
line (the stock of the musket grasped by the right hand and the barrel steadied by the left) should be straight forward; any attempt to parry by a corresponding right or left would only cause a point to glance from one man into another. The foot soldier isolated can parry head or body cuts and thrusts from sabre or lance, and can riposte by jerking forward or right or left the point, striking the horse if he miss the rider. Certain modern bayonets used for the rifle corps are very long, with a view to compensate in a measure for the shortness of the firearms at the end of which they are fixed. Such bayonets have besides their point an edge wherewith to cut. The lance is utterly worthless, except for cavalry, by whom it can be most efficiently employed in pursuing a routed foe; its use as a fencing weapon, therefore, requires little explanation. The knife or dagger requires quickness of hand and eye. The blow can be given by striking downward, straight forward, or upward; in the two latter cases the weapon is shifted from the ordinary grasp of the handle, so that the pommel rests in the palm of the hand and the stab is given with ease and force. The Spanish colonists employ their hats held in their left hands as shields, and also to mask the attack, concealing the knife behind the hat. The stick is a formidable weapon used to inflict blows, as with the broadsword; the ferrule end can as a point be most effectually driven into the face of an adversary. The quarterstaff is out of use; it was held in the middle and used not only in striking but in thrusting, when one end was suddenly driven forward like a bayonet.—

In 1536 Marozzo of Venice published the first work on the subject. Other works are: Thiibault, Académie de l'épée (Paris, 1628); Meyer, Kunst des Fechtens (1670); La Boissière L'Art des armes (Paris, 1815); Otto, System der Fechtsport (Olmutz 1822); Linsingen, Handbuch des Bajonetfechens (Hanover, 1854); J. Hewitt, "Ancient Armors and Weapons in Europe" (Oxford, 1866); G. B. McClellan, "Manual of Bayonet Exercise" (Philadelphia, 1866); G. Patten, "Infantry Drill and Sabre Exercise" (New York, 1861).

FÉNELON, Bertrand de Salignac, marquis de la Mothe, a French diplomatist, died in 1689. After having served with distinction in the army, he was ambassador to England at the time of the massacre of St. Bartholomew, and was charged by Charles IX. to endeavor to appease the resentment of Elizabeth. The most important of his numerous writings are: Mémoires touchant l'Angleterre et la Suisse, ou Sommaire de la négociation en 1571; Négociations de la Mothe Fénélon et de Michel, sieur de Mauvesière, en Angleterre, containing some curious statements, and of course, probably through his influence that he received in 1694 the rich abbacy of St. Valery. Toward the close of this year he drafted the famous anonymous letter to the king, setting forth the disorders and abuses of his reign, which was first published by D'Alembert, and whose au-
thenticity, after much dispute, was settled by the discovery of the original MS. in 1825. It is not probable that Louis suspected the author, for in the following February he nominated Fénélon to the archbishopric of Cambrai. The ceremony of consecration was performed in the chapel of St. Cyr, July 10, 1698, but the new prelate retained his connection with his pupils, with whom it was arranged that he should pass three months of every year. Honored by the king, beloved by the young princes, esteemed and consulted by the most influential person of the court, and holding high stations in the church and the palace, he was now at the height of his prosperity; but his disgrace was already preparing. With a natural tendency to all that is mild and spiritual in religion, he had long felt a sympathy for the doctrines of Mme. Guyon, whose system of "quietism" was attracting a large share of attention at court, and had gained proselytes in the king's household. She was charged with heresy, and a demand a commission to inquire into the matter. Bossuet, the bishop of Châlons, and Tronson were appointed. Besides the writings of Mme. Guyon, the commission was obliged to investigate what Fénélon was daily writing and preaching on the subject, perhaps with the intention of turning upon himself the condemnation that was threatening his friend. Fénélon was so humble in his intercourse with the commission, that his judges, though startled at his errors, would urge nothing against him. These conferences had lasted nearly a year, and it was necessary to put an end to them. Bossuet and his two colleagues agreed upon a series of articles which should settle the matter; and making a sort of formulary, they invited Fénélon to subscribe to it. He hesitated for a long time, but at last acceded to the demands of the prelates. During the interval of editing and signing the formulary, Fénélon was called to the archbishopric of Cambrai, and after his consecration occurred between him and Bossuet that celebrated controversy which forms almost an epoch in French literature. As Archbishop Fénélon assumed a more decided tone, Bossuet explained the articles of the formulary in an abridged report of the previous conferences, and asked Fénélon to give this book, entitled Instructions sur les états d'raison, his ecclesiastical approbation, as the other two prelates of the commission had done. Fénélon refused; he would not even read the book; and from this refusal dates the literary war between these two great prelates. Fénélon published his famous book, Maximes des saints. Bossuet denounced him to the court as a fanatic; the king struck his name from the list of preceptors to the royal family, and ordered him to retire to his diocese; Mme. de Maintenon withdrew her favor, and his friendship for Mme. Guyon was even made a theme for the interest of the church, and sent the obnoxious book to Rome, where Louis used all his influence to obtain its condemnation. After a delay of nine months Innocent XII. pronounced a mild censure of the Maximes des saints, but addressed at the same time to certain prelates who had been most severe in their attacks on the author the following caustic rebuke: Poscevi excessus amoris divini, sed vos peccasti defectu amoris proximi ("He has sinned through excess of love of God, but you have sinned through lack of love for your neighbor"). Immediately on receiving the sentence, in March, 1699, Fénélon hastened to declare his submission, and to publish the condemnation of his own book in a mandatory letter. In the following month his Aventures de Télémaque, which had hitherto remained in manuscript, was given to the world by the dishonesty of a servant who had been employed to have the work copied, but who sold it to a bookseller without disclosing the author's name. The king having been told that it was from the pen of the archbishop of Cambrai, and probably sharing a suspicion then current that the book was designed as a satire on the court, took measures to suppress it. A few copies escaped seizure, and an imperfect edition was printed in Holland in 1699, and others followed rapidly. This event destroyed all hope of restoration to royal favor, and for the rest of his life Fénélon devoted himself exclusively to the affairs of his diocese and to literary pursuits. It was now that his character was seen in its brightest light. He visited the peasants in their cottages, shared their humble fare, heard their complaints, relieved their wants, and made his palace an asylum for the unfortunate. His charities were enormous. When his diocese was traversed by hostile armies during the war of the Spanish succession, he was allowed to pass unhindered through the ranks of the enemy on his errands of benevolence. He founded the theological seminary of Cambrai, and devoted himself to the instruction of the clergy. When his pupil the duke of Burgundy became dauphin by the death of his father, he addressed to him a "Plan of Government," proposing the establishment of states general and provincial, with many reforms in public administration; and had the prince lived to reign, it is thought that Fénélon would have been his prime minister. The archbishop did not long survive his pupil. —Of the excellence of Fénélon's best work, the "Adventures of Telemachus," no better proof could be given than its general and lasting popularity. Hallam denies it the high character of an epic, but gives it the first place among classical romances. It has been translated into nearly all European languages, and has been turned into verse in English, Latin, Greek, &c. His controversial writings, which comprise works against the Jansenists and Gallicans, on quietism, &c., are distinguished by an unswerving preference of individual Christian experience to the testimony of the traditions of the church, and are, in the opinion of many, but空 them as chimerical. His spiritual works, a collection of which (Œuvres spirituelles, 5 vols.
12mo) appeared at Amsterdam in 1731, are used by persons of all denominations. His sermons (12mo, 1744), written during his youth, hold no very high place among productions of their kind, though not without eloquent passages. Among his other works are: Traité de l'éducation des filles (15mo, 1697), written at the request of the chevalier de Beaumont; Traité du ministère des pasteurs (1688); Démonstration de l'existence de Dieu (1718), after "Telemachus" his longest and most important work; and Dialogues sur l'éloquence en général, et sur celle de la chaire en particulier, with a Lettre sur la rhétorique et la poésie, addressed to the French academy (1718). An edition appeared at Paris in 1787-92 (8 vols. 4to), at the cost of the assembly of the clergy of France, but does not contain the Maximes des saints, the Mendements, nor the writings on Jansenism and quietism. The best editions of Fénélon's complete works are those by Gosselin and Caron (34 vols., Versailles and Paris, 1820-30), Adrien Leclère (38 vols., Paris, 1827-30), and the abbé Gosselin (10 vols. large 8vo, Lille, 1825). The best editions of his literary works are Didier's (Paris, 1861) and Ducrocq's (1862), of his philosophical works, Charpentier's (Paris, 1843) and Hachette's (1860); and that of his educational works, Didot's (Paris, 1850). Of the English translations of "Telemachus," the most esteemed is that of John Hawkesworth, LL. D., 4to, London, 1768, and 12mo, New York, 1859. His life has been written by the chevalier Ramsay (the Hague, 1733), his grand-nephew François Louis, marquis de la Mothe-Fénélon (1747), Y. M. de Querquenu (published with the Paris edition of 1787-92), Cardinal Bunsset (3 vols. 8vo, Paris, 1808-9); translated into English by Mudford, London, 1810, and abridged by Charles Butler, 1810), Lemaire (Paris, 1826), Cézarier (Paris, 1844), Villemain, Lamartine, etc. The Histoire littéraire de Fénélon, ou Revue historique et analytique de ses œuvres, by the abbé Gosselin, appeared in 1843. Il Françoise de Salignac de la Mothe, a French missionary, half brother of the preceding, born in 1641, died in 1679. He entered the congregation of St. Sulpice, and was sent to Canada in 1667. He was soon after missionary to some Cayuga Indians who had settled on Quinte bay, Canada, and founded an establishment for Indian children. During the collision between church and state he preached a sermon at Montreal in 1674, for which the count de Frontenac arrested him and brought him to Quebec. Fénélon refused to recognize the governor's authority or to remove his hat, on which Frontenac sent him out of the colony to France. The identity of names and profession led Hennepin to confound the two brothers, and some American writers have thus been led to believe that the author of "Telemachus" was a missionary in New York.

FÉNÉLON, Gabriel Jacques de Salignac de la Mothe, a French soldier and diplomatist, nephew of the preceding, born in 1688, killed in battle, Oct. 11, 1746. In 1724 he was appointed ambassador to Holland, and in 1728 represented France at the congress of Soissons. In 1733 he negotiated a treaty of neutrality with the states of Holland. In 1738 he was made lieutenant general, and served under Marshal Saxe. He was mortally wounded at the battle of Ramouls. He wrote Mémoires diplomatiques, and published the first complete edition of Les aventures de Télémaque, with a dedicatory epistle (2 vols., 1717).

FÉNÉLON, a political association having for its aim the independence of Ireland. The name is derived from the Fionna or Fianna, an Irish militia or home guard organized in the 8th century, and commanded by Fionn or Finn, who is said to be the Fingal of Ossian. He was slain in battle in 283, and the Fianna under his grandson Osagh were practically annihilated during a civil strife in 296. We shall here treat of the acts of the various organizations in Great Britain and the United States, designated under the local names of the "Phénix Society," "Irish Revolutionary Brotherhood" (1. R. B.), "Fénian Brotherhood," and "Nationalists," but better known as Fenians. The Fenian brotherhood was founded in New York in 1857 by Michael Doheny, John O'Mahony, and Michael Corcoran, subsequently a brigadier general in the Union army. At the same time a kindred organization already existing in Ireland, under the name of the Phénix society, was developed into large proportions by James Stephens, the funds for its maintenance being sent over from New York. Stephens came to America in 1858, reported the existence of 80,000 enrolled and disciplined followers, and solicited further aid. At a meeting of the "friends of Ireland," called in New York, a fund was raised, and the Fenian brotherhood was formally organized under John O'Mahony as president. Just then several members of Phénix clubs were arrested in Ireland; and this incident, revealing to Stephens the existence of traitors in his own ranks and the watchfulness of the British government, compelled him to adopt a course of caution and temporary inaction. But the occurrence gave a great impulse to the Fenian cause in America; one of its consequences being the organization of the first "Phénix" regiment in the United States, Col. Corcoran's 86th New York national guard, which refused to parade at the visit of the prince of Wales in 1860. Stephens, who had taken up his abode in Paris, with large funds at his disposal, was buoyed up by the certainty that his supporters in America were hourly increasing. In Ireland his subordinates covered the provinces with a network of clubs, which met secretly to drill. In 1860 O'Mahony visited Ireland, inspected the most important districts, and held a meeting of the Fenian leaders in Dublin, at which definite plans of action were agreed upon. Stephens forthwith returned to Ireland, and O'Mahony to the United States, the organization receiving from their presence a new
impulse in both countries. The Fenian brotherhood, when O'Mahony was first placed at its head, numbered 40 members, all in New York city; it now extended its ramifications all over the United States, and even into British America and Australia, while in Great Britain it established ‘circles’ wherever Irishmen were to be found. Stephens divided his followers into four classes: A, colonels, in command of battalions; B, captains, commanding companies of 100 men; C, sergeants, at the head of 20 men; D, privates. ‘Unreserved obedience to orders, absolute discretion in communicating with outsiders, and active zeal in extending the organization,’ were the main principles inculcated on all. Catholics in Ireland were prohibited by law from possessing firearms; hence one of the great difficulties of carrying out any aggressive movement. But smithies for the manufacture of pikes were stealthily established in many places. This deficiency of firearms, and the want of preconcerted action among the leaders, combined with other reasons, caused the failure of the enterprise in Ireland.—In the United States up to 1863 the Fenian organization was but little known and less understood. Americans saw men assembling by night, and quietly drilling; but they were confused with the military organizations everywhere existing, and were supposed to be made up of working men who could meet for drill at no other time. The ‘circles’ established in all American cities furnished not a few regiments at the commencement of the civil war. After the first battle of Bull Run, and the return to New York of the 9th regiment, the ‘Irish Brigade’ under Thomas Francis Meagher was formed; the movement was imitated elsewhere, even in the south, and the Fenian element was active in filling up the ranks of volunteer regiments. When in 1862 Michael Corcoran was liberated from a southern prison, his prominent position as a Fenian leader served not a little to draw the organization into the Union ranks, with the ulterior hope of using the military experience thus acquired in the cause of Ireland. This raised the hopes of Stephens and his confederates in Ireland. Early in 1868, T. O. Luby, one of the Irish leaders, came to America, and not only visited in company with O'Mahony the principal Fenian centres in the United States, but was allowed to penetrate the lines of the Union army, and to hold meetings at the headquarters of Irish regiments. This tour raised on both sides of the Atlantic expectations of speedy success. On Nov. 3, 1863, the American organization, or Fenian brotherhood, held its first ‘national congress’ in Chicago, the delegates representing 15,000 enrolled Fenians, one half of whom were in the Union army. This assembly proclaimed the Fenian brotherhood to be strictly in opposition to the government of the United States, ignored partisan politics and differences in religion, and declared the Irish people to be a distinct nationality, with James Stephens as its head, to whom, with central officers elected by an annual congress, state officers elected by state organizations, and ‘centres’ elected by circles, the direction of affairs should be intrusted. A grand fair, ostensibly for the relief of Irish sufferers, but in reality to aid the Fenian brotherhood, was held in Chicago at the close of this congress, and contributed a large amount to the treasury. The cause had hitherto had no official organ in Ireland. Immediately on his return to that country, however, was published the first number of the ‘Irish People’ in Dublin, Nov. 28, 1863. The bold utterances of this sheet caused the police to watch every movement at the various centres of Fenian activity. On Feb. 28, 1864, a riot occurred at a public meeting in the Rotunda, Dublin, in which Mr. A. M. Sullivan, who had openly attacked the ‘I. R. B.,’ was, together with his adherents, ‘the national party,’ ejected by the Fenians. The numbers of the latter, and the perfect discipline with which they acted in their attack on the opposing faction, were a revelation to the authorities, while the victory itself was to the friends of Ireland prophetic of the dimensions destined to mark every attempt at revolution. Stephens again returned to the United States in March, 1864, and visited the different corps of the Union armies, under the pseudonym of Captain Daly. The prudence and secrecy which always characterized the movements of this leader found but few imitators among his followers. The bravado with which the Irish press in America and the ‘Irish People’ in Dublin spoke of the near liberation of Ireland, and the enthusiasm expressed by the Irish masses at home and abroad, served the British government effectively. Stephens left New York at the end of July, his presence having given an extraordinary impulse to the spread of the brotherhood.—When the second Fenian congress assembled in Cincinnati, Jan. 17, 1865, the circles had increased five fold, and the financial receipts exceeded the total of the seven previous years. A report from an agent sent to Ireland stated that the masses were desirous of revolution, and that the middle classes, though hesitating, would in extremity act with the patriots. The surrender of the confederate armies and the disbandment of the Union forces left free those Irish officers and soldiers on whom were centred mainly the expectations of the revolutionists. Many of these officers now went to Great Britain; and about this time dissatisfaction began to spread among the Irish troops in the British service. It was no longer a secret that the ‘Fenian conspiracy’ had its ramifications all over Great Britain as well as Ireland. On Sept. 8 a proclamation from Stephens was circulated among the circles in Ireland, announcing that the time for action had come. ‘I speak with a knowledge of the United States, I speak with a knowledge of authority to which no other man could pretend,’ he says, in concluding; ‘the flag of Ireland, the Irish republic, must this year
be raised!" But every purpose and act of Stephens was made known to the British government. On the night of Sept. 15 a squad of the Dublin police suddenly seized the office of the "Irish People," taking into custody Jeremiah O'Donovan-Rossa, the registered proprietor, and several of the editorial staff and other employees, among whom was Pierce Nagle, who turned crown witness at the subsequent trial. Another squad arrested Thomas C. Luby, the chief editor, at his residence, capturing among other documents a letter addressed to "Miss Frazer," but which in reality was an official document signed by James Stephens appointing a committee of three to govern "the home organization," with the same supreme authority hitherto exercised by himself. There were resolutions also from the brotherhood in America, signed by O'Mahony, formally recognizing Stephens as the chief executive and head of the Irish republic. The next day appeared two proclamations from the viceroy, Lord Wodehouse. The first announced the existence of "the Fenian conspiracy," and offered a reward of £200 for the apprehension of James Stephens; the second declared military law in the city and county of Cork, and offered another reward of £200 for the apprehension of one Geary. Simultaneously with the arrests in Dublin, which continued daily for several weeks, others were made in different parts of Ireland. In England, at the same time, several leading Fenians were arrested in Liverpool, Manchester, and other cities. On an American steamer landing at Queenstown, C. U. O'Connell, an aide-de-camp of O'Mahony, was taken into custody, and upon him were found papers incriminating many persons. The utmost energy was displayed by the British authorities; vessels of war were despatched to the principal seaports, and a cordon of gunboats surrounded the Irish coasts. Stephens, under the name of James Herbert, had occupied a villa near Dublin, where on the night of Nov. 11 he with three others was arrested by the police. He was committed to prison, whence he escaped on the 24th of the same month, and finally reached France. Bills of exchange in large amounts from the Fenian treasury in New York to the Irish leaders had fallen into the hands of the government.—No sooner had tidings of this reached the United States than the "central council of the Fenian brotherhood," sitting in New York, summoned the third congress, which assembled in Philadelphia, Oct. 18. During its sitting, P. J. Meehan, editor of the "Irish American," and accredited agent to the brotherhood in Ireland, returned, and reported the state of the organization as "perfect, the management masterly, and the position solid," and this at the very moment when the Irish revolutionists were utterly helpless. To this congress 850 circles, representing 30 states, sent deputies, and among the circles those styled "army and navy" had 14,620 members. This session of the third congress authorized the establishment of a "Fenian sisterhood," which spread rapidly, and proved a successful auxiliary in raising funds. It also adopted a new constitution, creating a president, secretaries of departments, a senate and house of representatives, and authorized the issue of bonds of the Irish republic. A deputation from this "convention of Irish-American citizens" obtained from President Johnson the release from Fortress Monroe of John Mitchel, who had been confined as a prisoner of state. He was despatched to Europe as the accredited agent of the brotherhood, and bore with him a large sum of money in aid of the struggle in Ireland. After the adjournment of this congress public offices were opened in New York, and the issue and sale of bonds were actively carried on for some time. But a fatal dissension now manifested itself between O'Mahony and the newly created senate. Meanwhile events in Ireland were hurrying onward. The New York commission to try the Fenian prisoners commenced in Dublin Nov. 27. O'Donovan-Rossa was sentenced to penal servitude for life, and Luby and O'Leary for 20 years. The judges then proceeded to Cork, where similar punishments were dealt out. In the mean time the rupture in New York between O'Mahony, who had been created president of the whole brotherhood, and the majority of the senate, had been gradually widening. He and his friends wished to operate in Ireland, while the senate favored the scheme of an armed expedition into Canada, and henceforth were designated by their opponents as the Canada party. On Jan. 2, 1866, the fourth Fenian congress assembled in New York. More than 400 delegates attended from Canada, Australia, and all parts of the United States. The old constitution was restored and O'Mahony reinstated as head centre. These proceedings were accepted by a military convention held in New York, Feb. 22; but the hope of a permanent reconciliation soon ended in a worse misunderstanding. The sentences pronounced in Ireland on the prisoners did not seem to damp the courage of the Fenians. On Feb. 24 Lord Wodehouse wrote to the English home secretary that as many as 500 Irishmen from America, "thoroughly reckless, and possessed of considerable military experience," were known to be engaged in swearings in members throughout the country; adding: "The disaffection of the population is alarming, and is day by day spreading more and more through every part of the country." Parliament on Feb. 17 suspended the habeas corpus act. A large number of arrests were made in Dublin, and before the end of March 870 persons had been taken into custody, the number reaching 758 at the accession of the Derby ministry in July. The excitement of the Irish element in America became uncontrollable. Meetings were held in the chief cities, and the central office in New York was
URGED TO IMMEDIATE ACTION. O'Mahony was at length formally impeached and deposed by the senate, and Col. William R. Roberts was elected in his stead. While Roberts was preparing to move on Canada, O'Mahony was induced to consent to an attempt to occupy the island of Campo Bello, New Brunswick. A steamer was purchased in New York early in April for the purpose of carrying arms to Eastport, Maine, a few miles from Campo Bello. The command of the expedition was assumed by Major B. Duran Killian. Five hundred men quietly gathered at Eastport, and awaited the arrival of the steamer with the arms. But O'Mahony, who was still recognized as president by a portion of the Fenians, had countermanded the sailing of the steamer, and ordered the New York Fenians at Boston to return home. From Portland was now sent a schooner with 750 stand of arms, the offering of Fenian sympathizers; but the arms were seized by the United States authorities, and Gen. Meade having arrived and telegraphed for troops, the Fenians dispersed and made their way home as best they could. On May 10 Stephens arrived in New York, apparently confident that both parties would yield to his leadership. O'Mahony, in order to facilitate a reunion, gave his resignation, which was accepted, and Major Killian was removed from his command. The Roberts party immediately came to an issue with Stephens on the proposed invasion of Canada. This Stephens decidedly opposed, urging that all present efforts should be to raise money for the purpose of helping "the men in the gap" in Ireland. These men, he said, numbering hundreds of thousands, needed only money to win their independence. All this while both factions continued bitterly to assail each other's motives and acts. Under the military direction of Gen. Thomas W. Sweeny, an officer of the American army, the Roberts party began to act about the middle of May. On the 19th 1,200 stand of arms were seized at Ronse's Point, near the Canadian frontier, by the United States custom-house officers. From the 29th to the 31st bodies of Fenians from various points of the west and southwest moved toward Canada, and a new seizure of arms was made at St. Albans on the 30th by the United States authorities. The Canadian government put the entire militia of the western provinces under arms, and they took the field under Sir John Mitchell, while companies of volunteers and regulars were sent to the various threatened points. On June 1, 1,800 or 1,500 Fenians under Col. O'Neill crossed the Niagara river at Buffalo and took possession of an unoccupied work called Port Erie. On the 2d they were attacked at a place called Limestone Ridge, and held their position, losing several killed and wounded and many prisoners. They withdrew the same night, and 700 were intercepted by the United States gunboat Michigan. Subsequently Gen. Barry, in command of the frontier, paroled 1,500 upon their promising to return to their homes, and to desist in future from any violation of the neutrality laws; the officers being required to give bail to appear and answer when required for an injunction of the laws. The Fenians continued to pour into Buffalo, but were ordered back by their commanding officers. Along the frontier of Vermont Gen. Meade concentrated a large force of United States troops. The president issued a proclamation of neutrality, and gave orders for the arrest of the Fenian leaders. On June 7 Gen. Sweeney and his staff were arrested in St. Albans, Roberts in New York, and several others in Buffalo. Roberts having refused to give parole or bail, was detained in jail for several days, and then released. During this period large sums of money were contributed; and the proposed rising in Ireland was made the occasion of a "final call" for funds, issued Aug. 25, 1865. From that date up to April, 1866, the sum of $250,000 was contributed by the Fenian brotherhood, of which the British government intercepted $42,000, and $3,500 were lost by an agent in Ireland. To counteract the effect of these disasters Stephens pledged his word that there should be a fight in Ireland within the coming year. In September Roberts summoned a congress in Troy, which was numerously attended. The case of Col. R. B. Lynch and a priest named McMahon, who had been taken prisoners at Limestone Ridge, tried, and condemned to death, served for a time to keep alive public attention in the United States; but through the good offices of the American government, these sentences were commuted. In December Stephens called a meeting of Fenian centres in New York, in which future plans of action in Ireland were discussed. He was opposed to any overt attempt under present circumstances; and to convince his followers that his advice was not the result of personal fear, he professed his readiness to go at once to England and allow the British authorities to do their worst upon him. But while rejecting this offer, the party of action would not accede to their chief's prudent counsels. About 50 persons were sent, in conformity with the promise of another rising wrung from Stephens, as "commissaries" to Great Britain; among them were the two "centres" Kelly and Denby, and Godfrey Massey.—The invasion of Canada, the publicity given in America to the designs of the Fenian leaders, the agitation fostered on both sides of the Atlantic on the occasion of the condemnation to death of Lynch and McMahon, and above all the exact information obtained by the British authorities from agents in the Fenian ranks, caused a seconal suspension of the habeas corpus act, Aug. 10. A reward of £2,000 was offered in Newfoundland for the apprehension of Stephens, said to be on his way to Ireland; fresh regiments were sent to the latter country; and 97 leading emissaries of the brotherhood were arrested and imprisoned under the viceroy's warrant. It there-
fore behooved Massey and his confederates to be wary. Having resolved to make England the principal field of action, they established a "central directory" of 15 members in London, while subordinate directories were formed in Liverpool, Manchester, Birmingham, Leeds, and Glasgow. Massey, after making a tour of inspection in Ireland, reported the organization there to be so numerous and well appointed that a rising was forthwith resolved upon, and a plan of campaign adopted. The castle of Chester was garrisoned by a company belonging to an Irish regiment, and in it was stored a considerable quantity of arms and ammunition. A plan was formed to seize these, and the 11th of February was fixed upon for its execution. On the 10th the directory met in Liverpool to arrange the last details for the morrow's operations. At midnight the magistrates of Liverpool were fully informed of everything by one Congdon, who exhibited a commission in the Union army and another in the Fenian service. In less than half an hour the mayor of Chester was warned of his danger, and he hastened to post a strong body of men in the castle. From 2¾ A.M. every train arriving in Chester brought many Fenians, until their number reached some 1,200 at 4 P.M. At that hour a company of regular troops arrived from Manchester, and a regiment of the guards was promised from London. Numbers of special constables had meanwhile been sworn in and armed. The Fenians saw they had been betrayed, and after some futile demonstrations dispersed under cover of night. It was now impossible for the directory to countermand in time the simultaneous rising in Ireland, where the government had also been informed of everything, and had taken precautionary measures. Killarney had been chosen as the centre of Fenian operations in the south, and O'Connor was intrusted with the command. But at noon on Feb. 12 the frigate Gladiator, at anchor in Valentia bay, landed her marines to protect and assist the coast guard. At the same hour Capt. Moriarty was taken prisoner, and a body of 800 Fenians were dispersed without any serious resistance. Another large body withdrew into the Toomies mountains, but fled before the advance of the military. The attack on Chester castle and this rising in the south of Ireland were, in the conception of the directory, only preliminaries to a general insurrectionary movement throughout Ireland, which was to take place on March 5. This, it was commonly believed, was the day fixed in Canada for the execution of Fenian prisoners. But on March 8 Godfrey Massey, who had come over from England with final instructions, was taken prisoner at Limerick station. He divulged to the British government everything pertaining to the present plans and organization of the Fenian body, and its history. However, on the 5th the rising took place in Dublin, in accordance with the orders issued by the leaders. After dark, along every road which led from the capital and the neighboring towns to Tullagh light, numerous bodies of men were seen advancing in silence and arming themselves at convenient places on their way. A band of mounted policemen attacked and drove back a column of several hundred Fenians, who in the darkness, unaware of the extent of the attacking force, were stricken with a panic which became general. About the same hour a body of 1,000 partly armed men took possession of the police barracks and the city hall of Drogheda, and held them throughout the 6th; but finding no sympathy among the citizens, they disappeared during the night. In Munster the insurrection was pretty general; but beyond tearing up railway tracks, destroying telegraphic lines, and attacking isolated posts of constabulary and coast guards, nothing came of the movement in the south of Ireland. A considerable force of insurgents took refuge in the Galtee hills, whence they were soon driven by a heavy fall of rain. The special commission appointed to try the Fenian prisoners began its session in Dublin on April 8. In the subsequent trials T. F. Burke was condemned to death in Dublin, and John McCafferty in Cork, but their sentences were afterward commuted to penal servitude for life.—Stephens had meanwhile been relieved of the management of the Fenian organization, and the direction was vested in a committee until the fifth congress met in New York, Feb. 27, 1867. It elected as central executive A. A. Griffin; much money was raised and many measures were projected to aid "the men in the gap." The president of the United States was vainly appealed to for the purpose of obtaining belligerent rights for the Fenians. Toward the end of May a second invasion of Canada began to be talked of. Large bodies of men were seen drilling in Detroit and Buffalo, and recruiting offices were kept open by the Fenians; and St. Albans and Ogdensburgh were spoken of as depots of military stores and points of departure for a new expedition. But the United States authorities exerted the utmost vigilance, and orders were issued on July 80 for the arrest of all who should attempt any violation of the neutrality laws. The parent organization of the Fenian brotherhood had, however, dispersed in April an expedition to Ireland. On April 18 the brig Erin's Hope sailed from New York with 5,500 stand of arms, 3 batteries of artillery, 1,000 sabres, 6,000,000 rounds of small ammunition, a large supply of artillery ammunition, equipments for a brigade, and 39 officers of every grade of infantry, cavalry, artillery, and engineers. On May 18 she made Black Rock, 13 miles from the mouth of Donegal bay, and in a week got into communication with parties on shore. She remained 20 days on the coast of Ireland and four on that of England, and made three landings on the former and one on the latter. Several of the officers set afloat were captured; but the military stores were brought back to New
York. The return of the Erin's Hope prevented the sailing of a second vessel already half fitted up. Meanwhile a "provisional government" had been directing the movements of the home organization. In June, 1867, three of the directors brought against the fourth charges which compelled the dissolution of that body in July. Toward the end of that month a convention of delegates in Manchester elected Thomas J. Kelly central executive of the Irish republic. This did not meet the approval of the revolutionists, and another convention in the following winter appointed a supreme council of the I. R. B., consisting of seven members. Thus arose in the home organization a division similar to that which paralyzed the Fenian brotherhood in America. The sixth national congress of the Fenian brotherhood, embracing delegates from 18 states and the British provinces, assembled in New York Aug. 21. The object of this convocation was to reconstruct the brotherhood to meet the altered aspect of affairs in Ireland. The constitution was slightly amended, and John Savage was made chief executive. He found the treasury not only empty but several thousand dollars in debt, and saw that neither the time nor the means warranted armed collision. He therefore proclaimed a new era, to be based on discipline, obedience, and intelligence.—The directory in England now set about "organizing militarily" the Irish population throughout Great Britain, in order to keep the government in constant alarm. During the night of Sept. 13-14 the police of Manchester attempted to arrest four men of suspicious appearance; two of them escaped, and the others proved to be Col. T. J. Kelly and his aid, Capt. Deasy. On the 18th the van in which they were conducted to prison was attacked, the prisoners were rescued, and Sergeant Brett, in charge of the van, was killed. Subsequently five persons, Allen, O'Brien, Larkin, Maguire, and Cordon, were arrested, tried in Manchester, and condemned to death (Nov. 18), though protesting their innocence. From the moment of Brett's assassination every city in Great Britain was kept in a state of excitement and alarm, and several depots of arms and ammunition belonging to volunteer regiments were seized by the Fenians. This excitement culminated with the condemnation of the Manchester prisoners. Efforts were made to obtain a commutation of the sentence of the chief offenders; but neither the home secretary nor the queen would receive the deputations sent to them, nor were the attempts made to carry an appeal to a higher court more successful. Allen, O'Brien, and Larkin were executed Nov. 33, Maguire and Cordon having been reprieved. On Nov. 24 the Irish population of Manchester and London turned out en masse to march in funeral procession in honor of the dead. A week later Dublin witnessed a similar, and more imposing pageant. The 3d of December had been appointed for like demonstrations in Liverpool, Leeds, Glasgow, Cork, and Waterford; but the authorities forbade them. On Nov. 28 Col. Burke, a well known Fenian leader, was arrested by the London police, and with him one Casey, who had made a most determined effort to rescue him. They were both lodged in Clerkenwell bridewell. On Dec. 13, between 2 and 3 o'clock P. M., a barrel of powder which had been brought through the narrow and populous Corporation lane to the foot of the high wall enclosing the prison exploded, blowing down the wall, shattering all the neighboring houses, killing 6 persons on the spot, and wounding 130 others, 11 of whom subsequently died; but the escape of Burke, the supposed object of the explosion, was not effected. Amid the universal alarm and indignation, incendiary fires broke out in various parts of London. Thousands of special constables were sworn in daily in London for several weeks, until the number amounted to 50,000. The other cities containing any considerable Irish population followed this example. Five men and one woman were subsequently arrested for complicity in this outrage, one of whom, Michael Barrett, was found guilty of murder. The Fenians did not abate their activity in Ireland after the executions in Manchester and the Clerkenwell explosion. A large number of revolutionists had found their way into the hands of the initiated. On Feb. 7, 1868, Capt. Mackay (Lomasney), who had been the foremost leader in the March insurrection of the last year, was arrested in Cork with several others. The arrest led to riotous assemblages, in which firearms were used, and which were speedily suppressed. The Irish residents of London on Feb. 11 presented an address to the queen expressive of their loyalty, and repudiating the acts of the Fenians; it was signed by nearly 23,000 persons. Two events also occurred in the following months which alienated much sympathy from the Fenian cause. On March 11 the duke of Edinburgh was dangerously wounded by a man named O'Farrell in Port-Jackson, Australia. The assassin, though accused of being a Fenian, protested with his dying breath that he was not. On April 7 Thomas Darcy McGee, a member of the Canadian ministry, was killed on the steps of his own door; his opposition to Fenianism was alleged as the motive for the deed. These events so wrought on the public mind in England, that every effort made to obtain a commutation of the death penalty in the case of Michael Barrett utterly failed, and he was executed, May 26. They had also an effect on the trials of Burke and Mackay, who were sentenced to 15 and 12 years' penal servitude. The conviction had now become general that Fenianism was crushed. On July 81 the queen in closing the session of parliament declared that "the cessation of the long continued efforts to promote rebellion in Ireland has for some time rendered unnecessary the
exercised by the executive of exceptional powers. I rejoice to learn that no person is now detained under the provisions of the act for the suspension of the habeas corpus, and that no prisoner awaits trial in Ireland for an offence connected with the Fenian conspiracy."—The seventh Fenian congress assembled in New York, Aug. 24, 1868, and on the next day a "union convention of independent circles and clubs" met in the same city to devise means of ending the division in the Fenian ranks. Both bodies agreed in creating a commission to proceed to Europe, and endeavor to harmonize the conflicting claims for the control of the "home organization," and to secure a governing body on the American elective principle, which would represent officially all the "nationalists" in Great Britain and Ireland. Mr. Savage was chosen for this mission, and proceeded at once to Paris, where in a conference held in January, 1869, the project was successfully carried out. It now became the purpose of the Fenian leaders in America and Ireland to obtain the release of their imprisoned friends, and to induce the United States government to interfere in favor of several of them who were naturalized citizens. The corporation of Dublin proceeded to London in a body, and appeared, with the lord mayor at its head, at the bar of the house of commons, with a petition of amnesty for the prisoners. The English government, yielding to these solicitations, granted a free pardon to several. The combined and persistent efforts made in favor of amnesty for the prisoners were coupled everywhere with a demand for tenant right. This double agitation assumed such proportions that in the autumn the government sent additional regiments to Ireland. In the United States the Fenian brotherhood was legally chartered in August, under the act incorporating benevolent societies. The eighth congress assembled in New York, Aug. 25, 1869. The resolutions reported the release of their imprisoned friends; between the branches of the brotherhood in Great Britain and Ireland, and the progress both in numbers and character made by it in the United States. He also denied officially a report that Fenianism had entered into a league with European socialism. This year 1869 was rendered memorable by the disestablishment of the Irish church, and this measure was followed up by the passage in 1870 of an Irish land bill. The Fenians claim both these measures as the legitimate offspring of their efforts; and some English statesmen avowed that they were the necessary consequences of the Fenian agitation. The rigors to which the Fenian prisoners were subjected furnished a fertile topic for continued agitation. The subject had been brought before congress in December, 1868, and Feb. 10, 1870, and the house of representatives by resolutions condemned such cruelty, and urged the president to interfere in behalf of the victims. In Ireland J. O'Donovan-Ross, while a prisoner, had been elected to parliament for the county of Tipperary; the election was declared void, and Mr. O. J. Kickham, a recently released Fenian convict, was proposed for the vacancy, but failed of election. Thus was the popular sentiment kept in continual effervescence among the Irish in Great Britain, while in the United States the senate party on May 24 assembled another expedition on the Canadian frontier. President Grant lost no time in issuing a proclamation against the raiders, and Gen. Meade hastened to the border to enforce it. Col. O'Neill and several of his officers were imprisoned, and the men and arms were seized by the United States authorities. The ninth congress of the Fenian brotherhood assembled in New York on Aug. 30. O'Neill, in his prison in Windsor, N.Y., signed an agreement on Sept. 7, in the name of his adherents, by which they were reunited to the parent society. The British government, after witnessing this last impotent effort at invasion, and passing the Irish land bill, granted in December a partial amnesty to the political prisoners, on condition that they should quit British soil forever. In February, 1871, Mr. Savage insisted on laying down his charge in the brotherhood; his resignation was accepted by the tenth congress on March 21, and the office was abolished, and the direction vested in an executive council. A committee appointed to investigate the past financial affairs of the brotherhood reported that the total amount received in a little more than 12 years was $826,046, of which $425,224 were "expended for Irish revolutionary purposes direct," and $399,592 were "expended in America." The report states that of the amount expended in America, at least two thirds were not for organizing purposes and office salaries, but "for objects indirectly connected with the cause of the revolution in the British islands, such as the purchase of arms and vessels, the pay of armormen, the rent of armories, the support of men sent here on duty from Ireland, the relief of refugees (a vast sum), and the support of the families of some of the officers and men sent on duty to Ireland and England." The 11th Fenian congress, which met Aug. 20, 1872, reduced the number of the executive council to 10, to be elected by congress, including a chief secretary who is the executive officer of the organization, a position at present (November, 1878) held by John O'Mahony. FENNEC, an African canine animal, resembling a diminutive fox, belonging to the genus megalotis (Illiger). So vulpine is its look, that Mr. Gray, in his catalogue of the British museum, calls it vulpes Zaraenina (Skiodl.). When first described by Bruce the traveller, its zoological position was so ill determined that Buffon, who gives a good figure of the animal, called it Fennecus, because the ears and the tail and quadrumna by others; Zimmermann, from the examination of the teeth, seems first to have detected its dog-like affinities, and placed it in the genus canis; but whoever dis-
covered its true position, there can be no doubt that it belongs at the end of the canine family of digitigrade carnivora. From the enormous comparative size of the ears Illiger established the genus *megalotis*, which does not appear to differ much from *vulpes*; taking this well selected name of the genus, and the name of its first scientific describer for the species, it may properly be called *M. Brucei* (Griff.). According to Bruce, the animal is 9 or 10 in. long, with a foxy snout, ears half as long as the body and broad in proportion; the color white, mixed with gray and fawn color; the tail yellow, dark at the end, long, with soft and bushy hair like that of a fox; the ears thin, and margined with white hairs. The dentition, general appearance, and habits are canine; the feet are four-toed, with the rudiment of a fifth, and the nails are not retractile as Desmarest at first supposed. It inhabits northern Africa, particularly Abyssinia, Nubia, and Egypt. There seems to be a second species, nearly allied to but different from Bruce's fennec, the *M. Lalandii* (H. Smith); this is gray, with the hairs of the dorsal line longer and blacker than the rest, and the tufted tail black with a gray base. Rüppell gives the discovery of the first species to Skiddebrandt, a Swede, whom Bruce accuses of supplanting him by an unworthy artifice; he calls the fennec *canis zorba* (Zimm.), and makes it 23 in. long, including the tail, which is 8 in. It lives in holes which it digs in the sands of the desert, and not in trees as is supposed by Bruce; it is shy, very quick in its motions, and solitary; its food consists mainly of insects, especially locusts, eggs, dates, and other sweet fruits, and probably small animals; its bark resembles that of a dog, but is more shrill; the internal orifice of the ear is said to be very small. It is sometimes called zerda.

**Fennel** (*Foeniculum*, Koel.), a genus of umbelliferous plants, to which the British species (*F. vulgare*, Willd.), found on chalky cliffs in the southern parts of England, belongs. It is cultivated for the sake of the pleasant aromatic qualities of its leaves. It is frequently met with both wild and in gardens in the United States. Its leaves are singularly spread out into finely cut and almost hair-like segments; its flowers are yellow, and the stalks of the plant are glaucous. Once introduced into the garden, it propagates itself for years. A more attractive kind is the *finochio* or Azorean fennel (*F. dulce*), an annual cultivated in Italy as celery is with us. Several other species of fennel are known, some of which are admired for their pungency. Two kinds of fennel seed are found in the shops, one being sweeter than the other. It contains a volatile oil of agreeable odor, and is used in medicine as an aromatic. It yields its virtue to hot water and alcohol. The seeds of the shops are obtained partly from this country, but mostly from Germany. The odor of the seed and of the plant is fragrant, and its taste agreeable to most people. The infusion, prepared by adding two or three drams of the seeds to boiling water, is the best form for administering it. It lessens the disagreeable taste of senna and rhubarb, and acts generally as a carminative.

**Fenton.** E. Edward, an English navigator, born in Nottinghamshire about 1550, died at Deptford in 1608. He served for some time in the English army in Ireland, but joined in 1577 one of Frobisher's expeditions for the discovery of a northwest passage to Asia. The fleet being scattered by storms, Fenton returned to Bristol. Another expedition in which he took part ended disastrously. Early in 1582 he was placed in command of an expedition of four armed vessels, and sailed for Brazil with the ostensible purpose of passing the strait of Magellan. He however put in at St. Vincent, where he destroyed the flag ship of a Spanish squadron. In 1588 he gained much credit as commander of a vessel against the Spanish armada. II. Sir Geoffrey, an English author and statesman, elder brother of the preceding, died in Dublin, Oct. 19, 1608. He received a good education, and acquired literary distinction, especially by translating from the Italian Guic-
ciardini's "History of the Wars of Italy," which he dedicated to Queen Elizabeth (1579). He afterward became the principal secretary of state for Ireland, and exerted great influence in restoring there loyalty and tranquillity. His daughter became in 1608 the second wife of Richard Boyle, the great earl of Cork. He published a number of other works, the best known of which are "Golden Epistles," gathered from the works of Guevara and other foreign authors. III. ENGLISH, an English poet, of the same family with the preceding, born in Shelton, Staffordshire, May 20, 1668, died in East Hampstead, Berkshire, July 18, 1730. He studied at Cambridge, but becoming a nonjuror he was obliged to leave the university, after which he accompanied the earl of Orrery to Flunders as private secretary. On his return to England in 1706, he was employed in school teaching. Afterward the earl of Orrery confided to him the education of his son, and six years later Fenton became associated with Pope in a version of the Odyssey. According to Dr. Johnson, Fenton translated the 1st, 4th, 19th, and 20th books. In 1728 a tragedy entitled "Marianne" gained him more than £1,000. In 1727 he published a new edition of Milton's works, with a brief life of the author, and in 1729 a fine annotated edition of Waller's poems.

FENTRESS, a N. E. county of Tennessee, bordering on Kentucky, and drained by several affluents of Cumberland river; area, 870 sq. m.; pop. in 1870, 4,717, of whom 170 were colored. The surface consists principally of high table lands of the Cumberland mountains, affording excellent pasturage. Timber is abundant, and coal is found in various places. The chief productions in 1870 were 10,839 bushels of wheat, 109,084 of Indian corn, 24,067 of oats, and 11,718 of potatoes. There were 942 horses, 4,924 cattle, 8,021 sheep, and 12,017 swine. Capital, Jamestown.

FENWICK, George, proprietor of part of Connecticut, died in 1607. He came to America in 1638 to take charge of the plantation of Saybrook, so called after Lords Say and Broke, who with others had in 1633 procured a patent for the territory from Robert, earl of Warwick. Returning to England, he came back again in 1633, and from that time, as one of the patentees and agent for the others, superintended and governed the settlement Saybrook till 1644, when he sold its jurisdiction and territory to the Connecticut colony, as his associates had given up their contemplated removal to America. He afterward returned to England, where he became a colonel in the parliamentary army, and was appointed one of the judges of Charles I. Ferdinand, the name of three emperors of Russia.—Ferdinand II., born about 1557, died in January, 1598. He was a son of Ivan IV., the Terrible, and succeeded him in March, 1584. Noted for his incapacity, his brother-in-law, Boris Fedorovitch Godunoff, became the virtual ruler of the empire, and succeeded to the throne after having caused the assassination of Fedor's brother Demetrius. Fedor for himself, the last of the house of Burck, was believed to have been poisoned.—Ferdinand II., son of Boris Godunoff, was dethroned and murdered in June, 1605, after a reign of two months, by the partisans of the first pseudo-Demetrius.—Ferdinand III. (also designated II.), elder son of the czar Alexia, born in May, 1611, died May 8, 1632. He succeeded his father in 1676, was engaged in warfare with Poland and Turkey, curbed the power of the nobility, established in 1680 the first Russian school in Moscow, and introduced other reforms. He excluded from the succession his imbecile brother Ivan, and bequeathed the throne to his half brother Peter the Great.

FEODOSIA. See KAPFA.

FERDINAND, the name of several European sovereigns, arranged below under the heads of Germany, Naples, Spain, and Tuscany; Austria being included under Germany, Sicily under Naples, and Aragon and Castile under Spain.

I. GERMANY.

Ferdinand I., emperor of Germany, son of Philip I. of Spain and younger brother of Charles V., born at Alcalá, Spain, in 1503, died July 25, 1564. After the death of his grandfather, the emperor Maximilian I., he received as his share of the dominions of the house of Hapsburg the duchy of Austria and other German possessions. In 1521 he married Anna, sister of Louis II., king of Hungary and Bohemia, who in 1526 fell at the battle of Mohács and left no issue. Ferdinand claimed the right of succession in the name of his wife, and by right of previous family compacts. The states of Bohemia acknowledged him, but in Hungary a strong party declared for John Zápolya, waywode of Transylvania. Ferdinand marched against Zápolya, and his general Nicholas von Salm defeated him near Tokay; but the latter soliciting the aid of the Turks, Sultan Solymax espoused his cause. Ferdinand was forced to retreat to Vienna, where he was besieged by the Turks in 1529. After a long and bloody war a treaty was concluded, by which it was agreed that Zápolya should preserve the title of king of Hungary during his life, together with the districts then in his possession, after which they were to pass to Ferdinand. This treaty, however, owing to the prevailing influence of the Turks in Hungary, was not carried into effect, and the eastern parts of the country remained in possession of Zápolya's successor, as prince of Transylvania. In 1531 Ferdinand was elected king of the Romans; and on the abdication of Charles V. in 1556 he succeeded him in the empire. Pope Paul IV. refused to acknowledge him, on the ground that Charles V. had not obtained his permission to abdicate. Paul died before serious consequences had resulted from his refusal, and his successor, Pius IV., rec-
ognized Ferdinand. The electors, both Protestants and Catholics, met and decided that thereafter it should no longer be required of the emperors of Germany to receive the crown from the pope, thus putting an end to the many controversies and wars of which the dependence of the German emperor on the see of Rome had been the cause. In Bohemia Ferdinand arbitrarily declared the crown hereditary in his family without the sanction of the states. A portion of the population opposed him by force of arms, but the insurrection was suppressed. He was tolerant to the Protestants, and tried to effect a union between them and the Catholics by inducing them to send deputies to the council of Trent. He also endeavored to obtain from the pope the use of the cap for the laity in the communion, and the liberty of marriage for the priests. He was succeeded in the empire, as well as in Hungary and Bohemia, by his son Maximilian II.

**Ferdinand II.** Emperor of Germany and king of Hungary and Bohemia, born July 9, 1578, died in Vienna, Feb. 15, 1637. He was the son of Charles, Duke of Styria, third son of Ferdinand I. He was a zealous Catholic, and is said to have made a vow at Loretto that he would exterminate Protestantism. His cousin Matthias, emperor of Germany and king of Hungary and Bohemia, abdicated in his favor the crown of the latter country in 1617, and proceed his election as king of the Romans and as his successor in Hungary. The states of Bohemia refused to acknowledge Ferdinand, and a powerful Protestant rising was organized, at the head of which was Count Thurn. Shortly after the death of Matthias (March, 1619), Ferdinand was besieged in Vienna, the insurgents threatening to shut him up in a monastery, and cause his children to be educated as Protestants. He however remained firm, and being relieved by the timely arrival of loyal troops, repaired to Frankfort and claimed the imperial crown. He received the votes of all the Catholic electors, and was crowned emperor. The states of Bohemia now offered the royal crown to the elector palatine, Frederick V., son-in-law of James I. of England. Hungary united with Bohemia against Ferdinand, and Bethlen Gabor of Transylvania joined his enemies. This was properly the beginning of the thirty years' war. Ferdinand was supported by Spain, and Frederick was totally defeated at the battle of Prague in 1620, and driven into exile. Ferdinand was now acknowledged as emperor of Germany and king of Bohemia. He abolished the constitutional charter of Bohemia, and undertook most violent measures against the Protestants; but the latter strengthened their league in Germany by placing Christian IV. of Denmark at its head (1625). The imperialists, under Tilly and Wallenstein, were victorious in several campaigns, and besieged Prague and Vienna in 1629 by the peace of Lübeck. Ferdinand now redoubled the severity of his measures against the Protestants, when he received a formidable check by the intervention of Gustavus Adolphus of Sweden in 1630. The Protestants were upon the whole successful until the death of Gustavus at the battle of Lützen, Nov. 6, 1632. The victory at Nordlingen in 1634 was the last great success of Ferdinand's army.

**Ferdinand III.** Emperor of Germany and king of Hungary and Bohemia, son of the preceding, born at Graz in Styria, July 20, 1608, died at Vienna, April 2, 1657. He succeeded his father in 1637. From him he also received the inheritance of the thirty years' war, which soon took the aspect of a political rather than a religious conflict, Spain taking part with Ferdinand and France with the allied Protestants. The war was closed, as far as Germany was concerned, by the treaty of Westphalia, Oct. 24, 1648, although hostilities were still carried on between France and Spain. By this treaty Ferdinand gave up most of Alsace to France and a part of Pomerania to Sweden, recognized the independence of the Swiss confederation, restored to the son of the elector palatine Frederick V. a portion of his father's possessions, and acknowledged the rights of his Protestant subjects. He was succeeded by his second son, Leopold I.; the elder, crowned in 1658 king of the Romans as Ferdinand IV., having died in 1654.

**Ferdinand IV.** Emperor of Austria, and king of Hungary and Bohemia as Ferdinand V., born April 19, 1793, died June 29, 1875. His father was Francis I. (II.), who in 1806 resigned the title of emperor of Germany, having assumed that of hereditary emperor of Austria. Ferdinand was crowned as future king of Hungary in 1830, in 1835 succeeded his father, and in 1836 was crowned in Bohemia. His character was weak, and he was a mere tool in the hands of his minister, Prince Metternich. Disheartened by the troubles of 1848, he resigned the crown in favor of his nephew, Francis Joseph (Dec. 2), and took up his residence at Prague.

**II. Naples.**

**Ferdinand I.** King of Naples, illegitimate son of Alfonso the Magnanimous, born about 1424, died Jan. 25, 1494. His father, who had ruled both Naples and Sicily, as well as Aragon and Sardinia, bequeathed to him at his death in 1458 the throne of Naples. His reign was troubled, and the nobles conspired to kid John of Anjou in a descent upon the country. Ferdinand lost the battle of Nola in 1496, escaped to Naples with but 20 followers, and was reduced to the last extremity. He was, however, favored by Pope Pius II. and by Francesco Sforza, duke of Milan; and his partisans were greatly strengthened by the alliance of the Albanian chief Scanderbeg, who put himself at the head of the army of Ferdinand, defeated John of Anjou at Troja in 1492, and forced his flight into Italy. Ferdinand was cruel and revengeful. Count Piciulino was one of his illustrious victims. In this reign
the Turks made a descent upon Italy and captured Otranto in 1480, but Ferdinand recovered this city from them in 1481. Five years later the nobles revolted, and Ferdinand, after yielding to their demands, refused to fulfill his promises, and put the leader of the revolt to death. He was excommunicated by Pope Innocent VIII. in 1489, but regained his favor in 1492, and died while the formidable expedition of Charles VIII. of France was preparing to set out toward Italy.

**Ferdinand II.,** king of Naples, grandson of the preceding, and son of Alfonso II., born about 1468, died in 1496. His father, feeling himself universally detested, abdicated in favor of his son in 1496; but the people had conceived such a dislike for the house of Aragon, that Ferdinand's kindness toward them was treated only with derision. Many of his cities having sent ambassadors to the invading enemy, Charles VIII. of France, he renounced his throne, and took refuge in Ischia. But as soon as Charles left Naples the people recalled Ferdinand, who obtained money and soldiers from Venice in exchange for several Adriatic towns, and reconquered his kingdom. With the permission of Pope Alexander VI. he married his father's sister.

**Ferdinand III.** See Ferdinand V. of Spain.

**Ferdinand IV.,** king of Naples (afterward king of the Two Sicilies as Ferdinand I.), born in Naples, Jan. 12, 1751, died there, Jan. 4, 1825. When in 1789 his father, King Charles, became king of Spain, he succeeded him upon the throne of Naples, in accordance with the recent treaties of Utrecht, Madrid, and Vienna, which prohibited the reunion of the two crowns in any one prince of the house of Bourbon. Ferdinand being only eight years old, Marquis Tanucci was appointed regent. In 1788 he married Carolina Maria, daughter of the empress Maria Theresa, and left the affairs of government to his imperious wife and her favorite minister Acton. The cabinet of Madrid lost all influence over the court of Naples, which closely allied itself with the cabinets of Vienna and London, and joined the first coalition against France. Though forced in 1796 to make peace with France, Ferdinand renewed the war after the departure of Napoleon to Egypt. Austria, Sardinia, Tuscany, and Naples formed a league, and Ferdinand hurried to occupy Rome (November, 1798); but not receiving much aid from his allies, he withdrew before the arms of the French, who in 1799 entered Naples soon after Ferdinand with his family had escaped in an English fleet to Palermo. The Parthenopean republic was established in Naples, but after a few months Ferdinand was restored to his capital by a Calabrian army under Cardinal Ruffo. A terrible insurrection now began against the republic, the city was abandoned to the lazzaroni, and Ferdinand had to have returned only to shed the blood of his subjects. The success of the French in Germany and Italy obliged him in 1801 to sign a treaty surrendering a portion of his territory, and to support French troops in the remainder, thus putting Naples under the domination of France. War breaking out in 1805 between France and Austria, Queen Caroline thought it a favorable opportunity for throwing off the French yoke, and prompted Ferdinand to violate the treaty and to receive the support of an Anglo-Russian army. Hardly had he done this when Austria, conquered at Austerlitz, assented to the treaty of Presburg. Before its conclusion Napoleon sent an army against Naples, which obliged Ferdinand and his queen again to take refuge in Sicily, refused offers of negotiation, and on Dec. 25, 1805, declared that the house of Bourbon had ceased to reign over that kingdom, and gave the throne first to his brother Joseph, and in 1808 to his brother-in-law Murat. Ferdinand, protected by England, was able to save Sicily from French conquest; but the queen, as little willing to bear English as French supremacy, embroiled herself with the English ambassador, Lord William Bentinck, who was obliged to leave the island in 1811, and died in Vienna in 1814. Ferdinand was in 1812 forced to proclaim a constitution, and finally to resign his government to his son Francis. After Murat was dethroned by Austria in 1815, Ferdinand was restored to his former throne, and on Dec. 12, 1816, united Sicily and Naples into a single state, under the title of the Two Sicilies. He abolished the constitution which he had granted while in Sicily, but was forced to proclaim the democratic Spanish constitution of 1812 by a rising of the carbonari in 1820. He was soon after reestablished in absolute power by the Austrians.

**Ferdinand II.,** king of the Two Sicilies, grandson of the preceding, born in Palermo, Jan. 12, 1810, died in Naples, May 29, 1859. He succeeded his father Francis I. in 1830, and at once excited the most lively hopes by pardoning several political offenders and introducing economical reforms and liberal measures. Having thus lulled the revolutionary party, he changed his policy, adopting the principles of absolutism; and the history of the kingdom from that time is a history of conspiracies and rebellions, followed by trials, imprisonments, and executions. After many revolts and attempts at revolt in various parts, all Sicily rose in insurrection in January, 1848, and armed bands marched upon Naples to demand a liberal government. A constitution was granted them, modelled after the French charter of 1808; but the double dealing of the court and the impatience of the democrats led to a bloody collision at Naples, May 15, after which Ferdinand dissolved the chambers, annihilated the constitution, and restored the ancient order of things. Toward the close of the year Pope Pius IX. took refuge at Gaeta under his protection, and in 1860 the Neapolitan troops against the Mazzini government at Rome; for which service he bestowed
upon Ferdinand the title of rex piissimus. The reconquest of Sicily, which had proclaimed its independence, was completed after a protracted struggle. In the contests with the insurgents Ferdinand had ordered the bombardment of his principal cities, and thus obtained the epithet of bombardator, abbreviated into "Bombas," by which he has often been designated. The harshest treatment was exercised toward the political prisoners in Naples, who were estimated by Mr. Gladstone in 1851 to number at least 13,000. At the Paris congress of 1859 Ferdinand was advised to pursue a milder system of government, and to grant a general amnesty, which he declined to do. On Dec. 8 of that year, a private soldier attempted to assassinate him. In 1857 the seizure and confiscation of the Cegliari, a Sardinian merchant steamer in which revolutionists had been conveyed to Naples, led to a diplomatic rupture between Naples and Sardinia, France, and England. A few months before his death he proclaimed an amnesty, but with such limitations that only 70 bagnio convicts would profit by it; they were banished for life, and restricted to reside in America.

III. SPAIN.

Ferdinand I., the Great, king of Castile, Leon, and Galicia, born about 1000, died in Leon, Dec. 27, 1065. He was the second son of Sancho el Mayor, king of Navarre. In 1033 he received the hand of Sancha, sister of Bermudo III., of Leon, and the title of king of Castile, which was henceforth recognized as an independent sovereignty. On the death of Sancho in 1035, Bermudo attempted to reannex the new state to his dominions; but he was defeated and slain by Ferdinand in 1037. The young king of Castile forthwith claimed and received the crown of Leon, in right of his queen; and by able management and foresight he reconciled to his cause many lords who at first had opposed his accession to the throne. He soon gained popularity by his respect for the laws of the country, his maintenance of the ancient fueros, and his strict administration of justice. He invaded Portugal and acquired in 1045 a considerable portion of it. From 1046 to 1049 he was engaged in wars against the Moors, and reduced the kings of Saragossa and Toledo to tributaries. His elder brother, Garcia III., king of Navarre, having attacked him in 1054, lost his life in a battle fought near Burgos, in the plains of Atapuerca. By this victory Ferdinand gained several districts which formerly belonged to Navarre, and became the most powerful among the Christian princes in the peninsula. In 1056 he took the title of emperor, to indicate his supremacy in Spain. Toward the centre of the peninsula, he extended the boundary of Castile to the Duero, and compelled the emir of Seville to swear allegiance and to restore to him the relics of St. Isidro (1063). His last days were spent in extraordinary devotional exercises. Attacked by a sickness which he knew would be fatal, he returned to Leon, and divided his realms between his three sons.

Ferdinand II., king of Leon, Asturias, and Galicia, son of Alfonso VIII., died in 1188. He succeeded his father in 1157, the kingdom of Castile being given to his brother Sancho III. He carried on several successful wars against Portugal and the Moors, and instituted the order of the Christian knights of St. James.

Ferdinand III., saint, king of Castile and Leon, born in 1192, died in Seville, May 8, 1223. The son of Alfonso IX. of Leon by Berengaria, queen of Castile, he was indebted to his mother for the latter kingdom, of which he was placed in possession in 1197. His power being firmly established, he commenced in 1228 against the Mohammedans a career of conquest which effectually broke the Moorish power in Spain. In concert with several other princes he first carried his arms through Murcia and Andalusia. Alfonso, dying in 1230, declared his marriage with Berengaria void, and designated his two daughters by his first marriage as his successors. Ferdinand interrupted his progress for a while to secure the inheritance, which he soon accomplished, and thus permanently united the kingdoms of Castile and Leon. Being now sovereign of Spain from the bay of Biscay to the banks of the Guadalquivir, and from the confines of Portugal to those of Aragon and Valencia, he was enabled to push his conquests with renewed energy. In 1233 he triumphed over Aben Iud, king of Murcia; he then successively obtained possession of Toledo, Cordova, Ubeda, Trujillo, Jaen, and finally Seville, which surrendered Nov. 23, 1248, after a siege of a year and a half. Ferdinand was an unwavering enemy of the Jews and Albigenses who had sought a refuge within his dominions. He founded the university of Salamanca, and was canonized by Pope Clement X. in 1671.

Ferdinand IV., king of Castile and Leon, son of Sancho IV., born in Seville in 1285, died in 1812. He was only ten years old when his father died, and he saw himself assailed at once by his uncle Enrique, who coveted the regency, by Don Juan Nuñez de Lara, who wanted to increase his estates, and by the infantes of La Cerda, who claimed the crown, and who, respectively aided by the kings of Portugal and Aragon, aimed at a partition of the kingdom. In these difficult circumstances the young king was sustained by the ability of his mother, Maria de Molina. She succeeded in dividing his enemies, conciliated the king of Portugal, whose daughter Constanza was married to Ferdinand, and also made an alliance with the king of Aragon. Ferdinand in 1305 made war upon the Mohammedans, gained advantages over them, and took Gibraltar (1809). The order of templars having been
abolished by Clement V., he confiscated their property and shared their spoils with the other orders of chivalry. There is a legend that in an expedition against the Moors, having ordered the two brothers Carvajal to be put to death upon mere suspicion, they cited him to appear with them in 30 days before the judgment seat of God; and within the prescribed time he was found dead on his couch, on which he had been taking his siesta.

Ferdinand V. of Castile, II. of Aragon, III. of Naples, and II. of Sicily, surnamed the Catholic, born at Seo, Aragon, March 10, 1452, died at Madrigalejo, Jan. 23, 1516. The son of John II., king of Navarre and Aragon, and of his second wife Juana Henriquez, he was as early as 1468, through the influence of his mother, declared by his father king of Sicily and associate in the crown of Aragon. On Oct. 19, 1469, he married at Valladolid Isabella, princess of Asturias, the sister and lawful heiress of King Henry IV. of Castile. On the demise of the latter, Dec. 12, 1474, Ferdinand and Isabella were proclaimed joint sovereigns of Castile. Several powerful nobles, among whom were the marquis of Villena, the archbishop of Toledo, and the grand master of Calatrava, aided by the king of Portugal, rose in arms in the name of Juana (called Beltrana, from her supposed father, Beltran de la Cueva), whom the late king had recognized as his daughter, but who had been set aside by the cortes on a charge of illegitimacy, which was never legally proved. Ferdinand's army gained a decisive victory over them at Toro, and in 1479 a treaty put an end to the civil war, and Juana, deserted by all her partisans, took the veil. John II. having died at the beginning of the same year, Ferdinand inherited Aragon, and thus became the undisputed master of the peninsula, with the exception of Portugal, Navarre (which was given to John's daughter Eleanor), and Granada. His chief policy was to fortify the power of the crown, and he reached his aim principally by reorganizing and increasing the hermandad or brotherhood for the suppression of disorder and brigandage, by improving the administration of justice, by acquiring the mastership of the several orders of knighthood, and obtaining the power of appointing the bishops, but above all by means of the inquisition, which served not only as a guard against heresy, but also as a political institution to keep the nobility and clergy in check. The intolerance was perhaps still greater against the Jews than the relapsed heretics. On March 31, 1492, an edict for their expulsion was issued by the sovereigns at Granada. The number thus driven forth is estimated by some as high as 800,000, but by others, according to Prescott with more probability, at 160,000. They sought refuge in Portugal, France, Italy, Africa, and the Levant. Before this, however, Ferdinand and Isabella had succeeded in accomplishing their long cherished design of destroying the last vestige of Moorish power in Spain. The kingdom of Granada, all that remained of the once powerful empire of the Moors, succumbed to the assaults of the Christian warriors; the city itself, the siege of which was considered a trial of the king and queen in person, surrendered Jan. 2, 1492, after a heroic resistance; and the last of its sovereigns, Abdallah or Boabdil, retired to Africa. When the Moors attempted a revolt in 1501, Ferdinand ordered them to become converted or to leave the kingdom, and it is said that from then till the time of Philip about 2,000,000 Moors left the country. In the discovery of America by Columbus Ferdinand had little if any share; he evinced no disposition to assist the discoverer, and the glory of having aided him belongs exclusively to Isabella. Charles VIII. of France having conquered the kingdom of Naples in 1494, Ferdinand sent thither in the following year his great general Gonsalvo de Cordova, and within a few months the French were expelled and the Spaniards got a foothold in Italy, which advantage they afterward improved. In 1500 he concluded a treaty of alliance with Louis XII. of France, by which the two monarchs divided between themselves beforehand the kingdom, which was to be conquered by their united forces; but scarcely was this accomplished when the allies quarreled, and Gonsalvo de Cordova for the second time drove the French out of southern Italy (1501-03), which thenceforth remained in the hands of Ferdinand, as King of Naples and Sicily. Family difficulties interfered for a while with his power and the progress of his conquests. Juana, the only daughter left to him (Isabella having been married to Emanuel of Portugal, and Catharina to Prince Arthur and afterward to Henry VIII. of England), had been married in 1496 to the archduke Philip, son of the emperor Maximilian; and on the death of Isabella in 1504, this young prince claimed the regency of Castile in the name of his wife. This brought on a contest between him and his father-in-law, which terminated in favor of Ferdinand, who was appointed regent in place of the young heir Charles on account of the premature death of Philip in 1506 and the insanity of his wife Juana. The king now found himself at liberty to give undivided attention to the affairs of Italy, and exercised there a paramount influence, not by his arms only, but by his superior political talents. He took part in the league of Cambrai against Venice in 1508; then in the holy league in 1511 against the French, whom the princes of Italy desired to expel from the peninsula; and in all these transactions he was generally the gainer. Besides the kingdom of Naples, he added to his dominions several towns and fortresses on the coast of Spain, and in 1510 he sent Don Ferdinand Ximenes and Count Navarro in 1509 and 1610, and the kingdom of Navarre, which he wrested from Catherine de Foix and her husband Jean d’Albret in 1612. By a singular
whom, or perhaps through the troubles created by the archduke Philip, Ferdinand had been estranged from his grandson Charles, afterward emperor under the title of Charles V.; and he thought of depriving him of part at least of his inheritance. He had consequently married in 1506 Germaine de Foix, a niece of Louis XII. of France; but the child he had by her died, and he was thus disappointed in his hopes. In 1518 he took a pil- ttre for the purpose of restoring his exhausted vigor; but the potion produced a lingering illness which ended in death. Ferdinand was the founder of the greatness of Spain; he consolidated the whole peninsula, with the exception of Portugal, into a single political body; gained for the crown a power which it had never possessed before; extended its influence beyond the peninsula, and gave it weight in the general affairs of Europe. To reach the aim of his ambition he was far from being over scrupulous in his means; a crafty politician and avaricious in every respect, he did not hesitate to break his word, or even his oath, when interest or bigotry commanded. But notwithstanding his perfidy and treachery, his memory has been held in great reverence in Spain; and the severity shown toward him by some historians cannot prevent posterity from regarding him as one of the ablest princes of his age. A just appreciation of his life and times may be found in Prescott's "History of Ferdinand and Isabella." (See ISABELLA.)

Ferdinand VI. was summoned the Wise, king of Spain, born Sept. 23, 1718, died Aug. 10, 1799. He was the son of Philip V. and Louisa Maria of Savoy, and ascended the throne in 1746. His government was one of justice, prudence, and peace. He encouraged manufactures, arts, and literature. He was one of the signers of the treaty of Aix-la-Chapelle (1748). He was succeeded by his half brother Charles III.

Ferdinand VII. was king of Spain, born in San Lorenzo, Oct. 13, 1784, died in Madrid, Sept. 29, 1833. He was the eldest son of Charles IV. and Louisa Maria of Parma. In 1789 he was declared prince of Asturias and heir apparent to the crown. Under the influence of his preceptor, the canon Escoquiz, he early felt a strong aversion to Godoy, prince of the peace, the favorite of both his parents. This was aggravated by Maria Antonieta of Naples, whom he married in 1802, and kindled into hatred in 1808 upon the sudden death of his wife, whom he asserted without sufficient proofs to have been poisoned. Henceforth two hostile factions openly divided the court: that of Godoy, supported by the king and queen, and that of the prince of Asturias, comprising the great majority of the nation, who shared in his hatred of the favorite. The dissensions between the son and the father, who was but a tool in the hands of his queen, and Godoy, grew in H. scandalous proportions. The crown prince, at the instigation of Escoquiz and others, addressed a letter to Napoleon, complaining of Godoy's conduct, and proposing to place himself under his protection, and to marry a member of his family. He also copied a memorial to the king against Godoy, which he was to have read to him in person; but Charles had him arrest- ed and kept in close confinement. A royal proclamation issued Oct. 30, 1807, denounced Ferdinand as having laid a plot against the power and even the life of his father. In a vague but humble letter, Ferdinand confessed that he had sinned against his father and king, implored forgiveness, and was publicly par- doned. These transactions were soon followed by more serious events. The royal family, who acted under the advice of Godoy, having at- tempted to leave Aranjuez with the ultimate view of embarking for America, a sedition broke out, March 18, 1808; the departure was prevented, and the people, infuriated against Godoy, stormed his palace, seized, wounded, and would have murdered him, had not the prince of Asturias, moved by the tears of his mother, used his influence over the crowd to save his life. The king was so much frighten- ed that he abdicated the next day in favor of his son. Two days later he attempted a re- traction, maintaining that his abdication had been forced; but the prince, who had been active in all these transactions, assumed the title of king, and made his solemn entry into Madrid, March 24. The peninsula was already invaded by French troops, and Murat soon marched into the capital. Ferdinand hoped to conciliate Napoleon by submission; he went as far as Bayonne to meet him; here, notwithstanding the empty honors which were paid to him, he found himself a prisoner, and was made to understand that he must restore the crown to his father. The old king, his queen, her favorite, and the infantes had also been brought to Bayonne; and yielding to a pressure which he was unable to resist, Ferdinand assented to the surrender of his royal title. But this title, and all the rights it conferred, had already been resigned (May 8) by Charles into the hands of Napoleon. The emperor de- clared that "the house of Bourbon had ceased to reign in Spain," and placed his brother Joseph on the vacant throne. Ferdinand was immediately transferred to the castle of Va- lençay, where he remained nearly six years. At length Napoleon, in the hope of diverting Spain, which Joseph had lost, from the co- alition against him, liberated his captive; by the treaty of Dec. 11, 1818, he restored to him the Spanish crown, on condition that he would make the English evacuate the peninsula, secure a large income to his parents, and keep in their offices and immunities all the Spaniards who had been in the service of King Joseph. On March 10, 1814, Ferdinand left Valençay; and on his arrival in Spain he was welcomed by popular acclamations, but the terms of the treaty with Napoleon, but expelled at once the afrancesados (supporters of the French government), annulled the pro-
ceedings of the cortes, and abolished the constitution. All the members of the cortes or the regencies who had participated in the framing of the constitution of 1812, or had faithfully adhered to it, were arranged before courts martial, tried, and sentenced. A number perished on the scaffold; hundreds of the most illustrious were sent to dungeons in Africa or imprisoned at home; the most fortunate were exiled. For six years Spain was given up to the unremitting cruelty of a revengeful tyrant, whose gross personal appearance and habits but added to the disgust of the people. At last discontent ripened into insurrection, the signal for which was given by the army. Troops assembled at the Isla de Leon to sail for South America revolted under Col. Riego, Jan. 1, 1820, and proclaimed the constitution of 1812, and the whole army followed their example. Ferdinand convoked the cortes and swore (March 9) faithfully to observe the instrument he had formerly annulled. Under the influence of a provisional junta who assumed the direction of affairs, he abolished the inquisition, banished the Jesuits, and re-established the freedom of the press. On the opening of the cortes, July 9, he renewed his oath to the constitution, and appeared to act in perfect accord with that assembly, while at the same time he was intriguing to defeat the plans of his own cabinet and to encourage the plots of the opposite party. This double dealing soon brought about bloody riots and finally civil war in the capital and nearly all the provinces. The liberals or constitutionalists, who formed a large majority of the nation, were strenuously opposed by the serviles or ultra royalists. The latter, pretending that the king was a prisoner in the hands of the cortes, organized an apostolic junta, and raised bands of insurgents in Navarre and Catalonia, under the name of "army of the faith." Monks and friars, among whom Mori and other enthusiasts, were at the head of these bands. At Madrid, the royal guards, secretly incited by their own master, attempted in July, 1822, to re-establish by force his absolute power; but after a violent struggle they were put down. Henceforth the constitutionalists held Ferdinand in a kind of imprisonment scarcely disguised under court ceremonial. A liberal ministry was appointed; energetic measures were resorted to; the "army of the faith" was totally defeated; its chiefs and soldiers, as well as the ultra-royalist committee known as the regency of Urgel, fled to France. The revolution was thus triumphant; but the "holy alliance" were preparing for its overthrow. France, which had assembled an army of observation near the Pyrenees, received orders from the congress of Verona to march into Spain for the purpose of restoring Ferdinand's ancient position. On the news of the threatened invasion, the king was removed to Seville, March 20, 1822; and on the rapid advance of the French under the command of the duke d'Anjou through the peninsula, he was declared to be insane, suspended from his power, superseded by a regency, and taken to Cadiz, where the constitutionalists intended to make a stand. But this project was baffled by the French army, which stormed the Tresmero, Aug. 91. The cortes then decided on declaring King Ferdinand reestablished; and the monarch at once published (Sept. 30) a proclamation granting a general amnesty, and securing the engagements entered into by the constitutional government. But having left Cadiz the next day, he revoked the proclamation and all his acts since March 7, 1820. He made his solemn entrance into Madrid, with the applause of the ultra-royalists, Nov. 13, and the work of vengeance commenced, and was continued for years. The noblest victims fell under the sword of the executioner, and terror reigned throughout Spain. Ferdinand did not even vince the least forbearance toward those who had served him most faithfully, but used his power against his friends as well as his foes. The most important Spanish colonies in America gained their independence during his reign. He had already been married three times and had no children, and took as his fourth wife, Dec. 11, 1829, Maria Christina, daughter of King Francis of Naples. This queen, much younger than her husband, gave him two daughters, and procured from him the publication of a decree abrogating the Salie law. This excited the anger of the partisans of Don Carlos, the king's brother; and insurrectionary movements broke out in the provinces, while intrigues were set on foot at the court for the recall of the decree. During a temporary illness the king was prevailed upon to abrogate it; but Christina, resuming her sway over her husband's mind, had it confirmed, and received herself the title of regent, while Carlos and many of his adherents were ordered out of the kingdom. This rekindled civil war, which broke out with great violence soon after the death of Ferdinand. His daughter Isabella, a child of three years, inherited the crown; but it was not secured to her till after a protracted and bloody contest.

IV. TUSCANY.

FERDINAND III, grand duke of Tuscany and archduke of Austria, born in Florence, May 6, 1769, died there, June 18, 1824. He came into possession of Tuscany in 1790, when his father Leopold II. was called to the imperial throne of Germany. The French invaded his dominions in 1796, under Bonaparte, and conquered them in 1799. Ferdinand became dispossessed by the treaty of Luneville in 1801, but in 1808 obtained as indemnity the archbishopric of Salzburg, with the title of elector of the empire. This electorate he exchanged in 1810 for the crown of Tuscany. In 1815 he was admitted into the confederation of the Rhine. After Napoleon's abdication in 1814 Ferdinand was restored to the grand duchy of Tuscany, but was again obliged to abandon his capital
for a short time in 1815, when Murat proclaimed the independence of Italy. The battle of Waterloo restored him.

FERDINAND IV., grand duke of Tuscany and archduke of Austria, grandson of the preceding, born June 10, 1838. He married Anna Maria, daughter of the king of Saxony, in 1856, and began to reign in 1859, after the abdication of his father Leopold II.; but a few months later the Tuscan constituent assembly declared in favor of annexation to Sardinia, which was consummated March 29, 1860, and which involved the forfeiture of the grand-ducal crown of Tuscany.

FERDINAND (Augustus Francis Anthony), titular king of Portugal, born Oct. 29, 1816. He is a son of Prince Ferdinand of Saxo-Coburg-Gotha. In 1836 he became the second husband of Queen Maria II. of Portugal, and the title of king was conferred on him, Sept. 16, 1837. After the death of the queen (Nov. 15, 1853) he was regent during the minority of his son, the late Pedro V., which ended Sept. 16, 1855. In 1870 he declined the Spanish crown offered to him by Prim and Serrano. He excels as a painter and engraver, and possesses many other accomplishments. He married on June 10, 1839, Eliza Hensler, born in Boston, Mass., in 1846. She is the daughter of a German shoemaker. Possessing remarkable beauty of person and voice, she was educated for the opera, and first appeared in New York in her 16th year. She afterward studied in Paris, sang at the Grand Opéra with little success, and went to Lisbon, where she became a favorite. Ferdinand procured for her the title of countess of Edia previous to marrying her.

FERNETINO (anc. Ferentimum), a town of Italy, in the province of 40 m. S. E. of the city of Rome; pop. about 8,000. It is situated nearly 1,600 ft. above the sea, and is surrounded by ancient walls built of hewn stone without mortar. The cathedral is paved with ancient marbles and mosaics. Ferentino is celebrated for its splendid view over the Volscian mountains, for its mineral springs, and for its antiquities. Besides large portions of the walls built in the Cyclopean style of large irregular and polygonal blocks, there are many other interesting remains of Roman structures and numerous inscriptions. The ancient Ferentinum seems, judging from the remains, to have been an important place, although little mention is made of it in history beyond the fact that Hannibal devastated it in 211 B.C. Horace alludes to Ferentium as a remote country town, but he is supposed to refer to another place of the same name in Tuscany.

FERGUSSON, Adam, a Scottish philosopher and historian, born at Logierait, Perthshire, in 1724, died in St. Andrews, Feb. 22, 1816. He was educated in Perth and in the university of St. Andrews, and studied theology in Edinburgh, where he became associated with Robertson, Blair, and Home. In 1748, though he had studied but half the required term, he was ordained, in consequence of having been selected for his knowledge of the Gaelic language to act as chaplain of one of the highland regiments, which he accompanied to Flanders. He remained in this situation till 1757, when he became conspicuous by his defence of the morality of stage plays, written upon occasion of the success of his friend Home's tragedy of "Douglas." In 1759 he was elected professor of natural philosophy in the university of Edinburgh, and in 1764 of moral philosophy. In 1778 he came to America as secretary of the commission appointed to negotiate with the revolted colonies, his place in the university being supplied during his year's absence by Dugald Stewart, who in 1785 became his successor. In his 70th year he paid a visit to the principal cities of the continent, and was elected a member of several learned societies. The last years of his life were passed in St. Andrews, where he observed a strictly Pythagorean diet. His "History of the Progress and Termination of the Roman Republic" (1788) is valuable for its philosophical reflections, clearness of style, and masterly portraiture of character. His "Essay on the History of Civil Society" (1787) discusses the origin, end, and form of government, affirms the natural sociability of men, in opposition to the hypothesis of Hobbes of their natural hostility, and defends civilization against the charges of Rousseau. His philosophical views are contained in his "Institutes of Moral Philosophy" (1799), and in his "Principles of Moral and Political Science" (1799). He belongs by his general method to the school of Bacon, recommending everywhere experience and the study of facts as the condition of successful research.

FERGUSSON, James, a Scottish experimental philosopher and astronomer, born near Kincardine, Banffshire, in 1710, died in London, Nov. 16, 1776. His father, a day laborer, taught him to read and write, which was the only education he was able to bestow on his children. When seven or eight years of age his attention was attracted to mechanics by observing his father raise a heavy weight with a lever. He investigated the principle and made several machines combining the lever and the pulley, which he described in a treatise with drawings. On showing this to a gentleman, he was surprised to find that those things had been treated of before, but was equally pleased that he had discovered the true principle. While tending sheep he made models of mills, spinning wheels, and other machines, acquired the rudiments of astronomy, taught himself to draw, made maps, and learned the principles of geography. By the aid of patrons he afterward studied portrait painting in Edinburgh, and next medicine, but finally devoted himself to astronomy. In 1748 he removed to London, where he attracted attention by a publication of astronomical tables. In 1747 he published "A Dissertation on the Phenomena of the
Harvest Moon," and afterward lectured in many places on experimental philosophy and astronomy. George III. settled on him a pension, and his time was mostly devoted to the delivery of his lectures, which had become very popular. The most important of his works are: "Astronomy Explained on Sir Isaac Newton's Principles" (4to, London, 1756); "Lectures on Mechanics," &c. (8vo, 1764); "An Essay Introduction to Astronomy" (1769); "An Introduction to Electricity" (1770); and "Art of Drawing in Perspective" (1778). Sir David Brewster published corrected editions of his "Lectures" and "Astronomy" in 1805 and 1811.

FERGUSON, Robert, an English physician, born in India in 1799, died June 25, 1855. He studied medicine at the universities of Heidelberg and Edinburgh, took the degree of M. D. in 1825, and settled in London, where he rapidly acquired a large and lucrative practice. He gave his hospital to the King’s College Hospital. He was also physician extraordinary to the queen, whom he attended in all her maladies. His chief publications are an "Essay on Puerperal Fever" and an edition of Gooch’s works.

FERGUSON, James, a British writer on architecture, born at Ayr, Scotland, in 1808. He was educated at the high school of Edinburgh, and after several years’ experience in a counting house in Holland and England, went in 1829 to India, where for ten years he was engaged in mercantile pursuits. Returning to England, he devoted himself to art and literature. During his residence in India he had taken great interest in the ancient architectural remains, and among the fruits of his observations was a description of the rock-cut temples with illustrations by himself (1845), and "Picturesque Illustrations of Ancient Architecture in Hindostan" (1847-8). In 1847 he published "Ancient Topography of Jerusalem," in which he undertook to show that the building known as the mosque of Omar is the church of the Holy Sepulchre. In 1849 appeared the first volume of his "Historical Inquiry into the True Principles of Beauty in Art, more especially with reference to Architecture," which was succeeded by the "Illustrated Handbook of Architecture" (1855), in the preparation of which he used the materials already collected for the succeeding volumes of the former work. In these works he gives a complete survey of the architectural monuments of the chief nations of ancient and modern times, and offers many suggestions of great practical value. His "Palaces of Nineveh and Persia," published while Mr. Layard’s excavations were proceeding, exhibits a profound knowledge of the architecture of the Assyrians and Persians; and upon the subsequent establishment of the crystal palace at Sydenham, of which he was the general manager for some time after its opening, he personally superintended the arrangement of the Nineveh court. His attention had been drawn in India to the use and application of earthworks in modern fortifications, and he proposed the substitution of circular forms for angles and bastions, and of earthworks for masonry. On this subject he published "The Peril of Portsmouth" and "Portsmouth Protected," and "Essay on a proposed New System of Fortification" (1849). His system was put in practice in the Russian defence of Sebastopol, and frequently employed in the civil war in the United States. In 1859 he became one of the royal commissioners for the defences of the United Kingdom. In 1871 he received the royal gold medal of the institute of British architects. Besides the works mentioned, he has published "A History of Architecture in all Countries," a reconstruction of his "Handbook" (3 vols., 1868-9), "Rude Stone Monuments of all Ages" (1879), and "Tree and Serpent Worship" (new ed., 1874).

FERGUSON, Sir William, a Scottish surgeon, born at Prestongrange, March 20, 1808, died Feb. 10, 1877. He early became confidential assistant to the celebrated anatomists Dr. Knox and John Turner, and in 1828 licentiate of the college of surgeons. He began to lecture on surgery in 1831, and in 1840 was called to London as professor of surgery in King's college. He was surgeon in ordinary to the prince consort Albert, and was created a baronet in 1865. He was elected president of the royal college of surgeons July 11, 1870. Besides special papers on cleft palate, lithotomy, lithotritry, aneurism, and others, he published "A System of Practical Surgery" (London, 1848), and "Progress of Anatomy and Surgery in the 19th Century" (1887). He was also the inventor of numerous surgical instruments.

FERISHTAH, Mohammed Rasul, a Persian historian, born in Astrabad about 1650, died probably about 1611. His father left his native country to travel in India, where he settled in the Deccan as instructor to the son of one of the reigning princes. The young Ferishtah was advanced to honors at court, but subsequently, induced by civil commotions and changes of government, repaired to the court of Ibrahim Adil Shah in Bijapour, where he passed the remainder of his life, and wrote his history of India. This work, which was first published in 1606, is one of the most authoritative oriental histories; it contains all the facts which the author deemed worthy to extract from more than 80 older histories, and is still in India the most popular history of the country. The introduction gives a brief account of India prior to the Mohammedan conquest, and then follows in 12 books a history of the kings of the different provinces, and of the European settlers. At the conclusion there is a short account of the geography, climate, and other physical circumstances of the country. It was several times partially translated into
FERLAND

English, and the whole work, with the exception of some passages which have been since discovered, was published in London in 1829 by Col. John Briggs, under the title of "The History of the Rise and Progress of the Mohammedan Power in India, from its commencement in 1000 to 1620." Col. Briggs also published an edition in Persian at Bombay in 1821.

FERLAND, Jean Baptiste Antoine, a Canadian historian, born in Montreal, Dec. 26, 1805, died in Quebec, Jan. 8, 1884. He was ordained priest in 1826, and afterward appointed professor of history in Laval University. He published a review of Brasseur de Bourbourg's "History of Canada;" "Notes on the first Register of Quebec;" "Journal of a Voyage on the Coast of Gaspeia;" "Labrador;" and a "Life of Bishop Plessis." At the time of his death he was engaged on a "Course of Canadian History;" the first volume had appeared, and the second was in the press.

FERMANAGH, an inland county of Ireland, province of Ulster, bordering on the counties Donegal, Tyrone, Monaghan, Cavan, and Leitrim; area, 714 sq. m.; pop. in 1871, 92,688. It lies almost wholly in the basin of Lough Erne, which divides it lengthwise into two nearly equal portions. Its S. W. part is mountainous, and the N. E. part rises into steep hills. The soil is as varied as the surface, but except a wide belt in the south is not remarkably fertile. The productions are oats, barley, wheat, flax, potatoes, turnips, and hay. Cattle are bred on the high grounds, and butter, eggs, &c., are exported. Limestone, marl, potter's clay, and small quantities of coal and iron, are the chief mineral products. Timber is more abundant than in most Irish counties, but is grown principally on the large estates, many parts of the county having a desolate appearance. There are next cotton manufactures, and few large towns; those worthy of notice are Enniskillen, Lismackea, and Lougherstown.

FÉRMAT, Pierre de, a French mathematician, born in southern France in August, 1601, died in Toulouse, Jan. 19, 1665. He studied law, and became in 1631 councillor at the parliament of Toulouse, devoting his leisure to mathematical studies. D'Alembert, Lagrange, and other French authorities claim for him the honor of having been the principal inventor of the differential calculus; and Laplace states that it was due to Fermat and his collaborator, Pascal. His theories are chiefly contained in his treatise De Maxima et Minima, published in 1679 with his miscellaneous scientific writings. Descartes combated his propositions concerning the calculus, and Fermat opposed Descartes's views in respect to geometry and optics.

FERMENTATION (Lat. fermentum, leaven, a fermentation, from ferere, to boil), the conversion of an organic substance into one or more new compounds, under the influence of a body which is called a ferment. It is a process which with more or less skill has been employed from the earliest times in the manufacture of alcoholic beverages, but its philosophy has been but imperfectly understood until recent times, and several questions still remain involved in doubt, and are matters of warm controversy. Formerly chemists recognized four kinds of fermentation, the vinous, the panary, the acetic, and the putrefactive; but now the panary is included in the vinous, while other kinds have been added, the number not being definitely settled. The following list may be given as the one usually recognized, although it will be seen that some of them are probably parts of the processes of others: 1. saccharine; 2. alcoholic or vinous; 3. acetic; 4. lactic; 5. butyric; 6. mucous or viscous; 7. putrefactive. To these there might be added without impropriety the benzoic, in which the amygdaline of the bitter almond, under the influence of emulsine, forms prussic acid and other bodies; and the sinapic, in which oil of mustard is produced during fermentation of the flour of black mustard. The act of digestion may also not improperly be regarded as a species of fermentation, because it involves, under the influence of minute organic cells, furnished by the mucous coat of the stomach, a transformation of proteine compounds into albuminose, which is just as truly a change by the influence of a ferment as the formation of lactic acid from lactic sugar, or of glucose from dextrine.—1. Saccharine Fermentation. In the article Baswing is described the process for the melting of barley, in which the production of diastase from albuminous matter accompanies the evolution of the grain into plumula and radicle. This diastase is the ferment of saccharine fermentation, by whose influence the starch of the grain is converted into sugar; the steps in the process being, first, the formation of soluble starch, then dextrine or gum, which next passes into glucose or grape sugar. Starch, soluble starch, and dextrine have the same chemical constitution, or more strictly speaking have the same proportion of elements, and may therefore be considered as allotropic conditions of each other. The transformation of dextrine into glucose consists in the assimilation of the elements of water, and may be represented in the following equation:

\[ C_6H_{12}O_6 + H_2O = C_6H_{12}O_6 \]

There is usually at the same time produced a small quantity of lactic acid, in consequence of a catalytic action, probably of the diastase, by which the glucose, having the same proportion of elements as lactic sugar, but differently grouped, takes on the functions of the latter substance and splits up into lactic acid. The saccharine fermentation, which takes place in mashing, is promoted by the action of heat, which should commence at about 85° and terminate at about 135° F.; but in a decoction of malt, as in the mash tun of the brewhouse, it is conducted at a higher temperature, from 188° to 167°. The drying of the malt in kilns at this stage arrests
the conversion of the sugar into lactic acid, which is evolved in considerable quantity if the malt is allowed to cool in a moist state. The action of dilute acids, assisted by heat, also has the power of converting starch into dextrine and grape sugar. (See Dextrin.)

—2. Alcoholic or Vinous Fermentation. If a decoction of malt is allowed to stand for a time in the open air at a temperature varying from 40° to 85° F., a change takes place, in which bubbles of carbonic acid gas may be seen to rise from the mass; and upon examination it will be found that portions of the sugar and gluten have disappeared, and in their place will be found alcohol, lactic, acetic, and succinic acids, and some glycerine, in varying proportions, depending upon the temperature and the amount of saccharification that had taken place in the malt. There will also be found more or less of a viscid substance containing yeast cells and germs and other microscopic organisms, and some mannate. If, however, instead of allowing the decoction of malt to ferment spontaneously, it be kept at a temperature of 168° to 167° F. until most of the dextrin has been converted into glucose, and then filtered and cooled to 70° or 85° with sufficient rapidity to prevent the commencement of premature fermentation, and then a quantity of brewer's yeast which has been kept in a warm place until it begins to decay be stirred in the mass, brisk fermentation will soon be induced, by which nearly all the glucose will be transformed into alcohol and carbonic acid, as represented in the following equation:

\[
\text{C}_6\text{H}_{12}\text{O}_6 = 2\text{C}_2\text{H}_5\text{O} + 2\text{CO}_2
\]

Under the most favorable circumstances not more than 95 per cent. of the sugar passes into alcohol and carbonic acid, the remainder being converted into succinic acid and glicerine. Both these bodies are formed, according to Pasteur, as follows:

\[
4\text{C}_6\text{H}_{12}\text{O}_6 + 2\text{H}_2\text{O} = 12\text{C}_2\text{H}_5\text{O} + 7\text{CO}_2 + 8\text{CO}_2
\]

The production of succinic acid in alcoholic fermentation was discovered by O. Schmidt in 1847. Pasteur discovered a few years ago that glicerine was also one of the products. Amylic alcohol or fusel oil is also frequently produced in alcoholic fermentation. Cane sugar, C_{12}H_{22}O_{11}, does not pass into alcohol and carbonic acid directly, but is first converted into glucose by assimilating one equivalent of water, thus:

\[
\text{C}_{12}\text{H}_{22}\text{O}_{11} + \text{H}_2\text{O} = 2\text{C}_6\text{H}_{12}\text{O}_6
\]

Cane sugar. Water. Glucose.

It then passes into alcohol and carbonic acid as before represented. Milk sugar, C_{12}H_{22}O_{11}, which has the same proportion of elements as grape sugar, but with a different molecular arrangement, is also transformed into alcohol and carbonic acid under the influence of cheese or other proteine bodies in a state of decay; first passing, according to some observers, into glucose. Most of grape or juice of fruit, if boiled and suspended in a bladder in the midst of fermenting must or wort, will not ferment; and it has been stated that if yeast cells be prevented from coming in contact with the fermentable liquid, fermentation will not take place, although the soluble contents of the cells may pass through the membrane. Should this statement be substantiated by further observation, it would go to show that the exceedingly minute germs of yeast cannot penetrate through the coats of animal membranes, although so small as to be scarcely visible under a magnifying power of 2,800 diameters, and would also show that fermentation, whatever may be the question as to its being itself a vital process or a chemical one, cannot take place without the influence of these vitalized germs. Yeast, torula ceroriis or mycoderma vinis, is a fungoid vegetable organism, composed of microscopic globules which attain a maximum diameter of about \(\frac{1}{200}\) of an inch. Each globule is composed of a thin membraneous cell wall having the composition of cellulose, C_{6}H_{10}O_{5}, and is filled with a gelatinous protein compound, principally consisting of exceedingly minute germinal granules. There are two varieties of yeast, depending upon the mode of propagation. When fermentation is conducted below 45° F., the propagation is carried on by an increase of the germinal granules within the cells by assimilation of nutriment from the fermenting liquid, until the cell wall bursts and the partially organized granules which are liberated proceed in their development, forming in turn parent cells. Yeast formed in this manner is called by the German brewers bottom yeast (Unterehe), and is the kind used in the fermentation of Bavarian beer. It is deposited during the process at the bottom of the fermenting tun in the form of a grayish viscid or gelatinous mass, the yeast being more or less mixed with other sedimentary matter. When, however, the temperature at which the fermentation is conducted is much above 45°, say from 70° to 85°, the development of germinal matter becomes much more rapid, and it passes, according to Dr. Lionel Beale, through pores of the parent cell wall, perhaps carrying a thin pellicle with it, and makes its appearance upon the outside in the form of what have been called buds, first discovered by Cagniard de la Tour. (See fig. 1.) These buds, which for a time remain attached by pellicles to the parent cells, then go on developing, and in time become detached and assume the functions of parent cells; or buds may spring from them before their separation, and thus branches extending to some distance may be formed, as in fig. 2. Fig. 8 exhibits an appearance often noticed: several buds growing from one parent cell, each filled with granular matter, and presenting an irregular outline. On account of its branching structure, yeast which grows in this way becomes buoyant from the collec-
tion of bubbles of carbonic acid gas between the branches, and rises to the top of the liquid, and therefore is called top yeast (Oberhöfe). It is the kind used in the fermentation of the wort of ale and strong spirituous liquors. It would appear, however, that the mode of propagation of yeast, and is composed, according to Mulder, entirely of phosphates of potash, soda, lime, and magnesia. — 3. Acetic Fermentation. Liebig regarded the conversion of alcohol into acetic acid rather as a process of cremasenia, or slow oxidation, by which hydrogen was removed and oxygen substituted; but as the process is facilitated by fermenters, particularly by the mycoderma aceti, it is generally regarded as a species of fermentation. Alcohol is readily oxidized by the influence of finely divided platinum into acetic acid, and also by binoxide of manganese and bichromate of potash. It is supposed that the reaction includes two stages: first the formation of aldehyde by the abstraction of two equivalents of hydrogen, water being at the same time formed; and subsequently the addition of one equivalent of oxygen, as represented by the following equations:

\[ C_2H_5O + O = C_2H_4O + H_2O \]

\[ C_2H_4O + O = C_2H_4O_3 \]
Aldehyde. Acetic acid.

If the supply of oxygen be insufficient, much of the aldehyde remains unconverted into acetic acid, and on account of its great volatility may pass away in vapor. Pure diluted alcohol does not absorb oxygen from the air, but requires the presence of some inducing body which shall modify the atomic character of the oxygen, and also perhaps of that of the alcohol, so that the affinity of the constituent hydrogen and the atmospheric oxygen shall be increased.

— 4. Lactic Fermentation. When milk is left to stand for a time, the lactic sugar (C_7H_12O_12) which it contains decomposes into lactic acid. The transformation is exceedingly simple, consisting merely in the splitting up of the molecules of sugar into a less complex arrangement, C_3H_2O_12 becoming 2C_3H_4O_3, or lactic acid. Caseine while passing into a state of decay was formerly supposed to be the ferment which induced the process; but according to Hallier and others, it consists of minute organisms which are developed from spores of penicillium crustaceum. (See figs. 4, 5, 6, 7.) The process is usually accompanied or immediately followed by the coagulation of the milk, an action which is generally ascribed to the abstraction of the alkaline constituents of the caseine, which are supposed to hold it in solution; but it is asserted by some observers that coagulation of new milk by rennet often commences before any lactic acid makes its appearance. Another mode of producing lactic fermentation is by the employment of glucose. When a solution of glucose is mixed with new sour cheese, or with milk and chalk, and exposed to a temperature of 75° or 80° F. for some weeks, with frequent stirring, the sugar is converted into lactic acid, which when chalk is used combines with the base, forming lactate of lime. The chalk is used for the purpose of combining with the acid, the accuma-

The inorganic matter represented by the ash amounts to about 7.5 per cent. of the dried
Fermentation

loration of which to a certain amount arrests the process.—6. Butyric Fermentation. Toward the close of lactic fermentation butyric acid makes its appearance, accompanied by the evolution of hydrogen and carboxylic acid, particularly when sugar of milk and lime are employed. The formation is represented by the following equation:

\[ \text{C}_6\text{H}_6\text{O}_6 + 2\text{H}_2\text{O} \rightarrow \text{C}_4\text{H}_6\text{O}_5 + 2\text{CO}_2 + 4\text{H} \]

Lactic acid. Butyric acid.

—6. Viscous or Mucous Fermentation. When the juices of beet root and carrot are left in a warm place for a few days, they spontaneously pass into the viscous state, for which reason this has been called the viscous fermentation. During the process there is an escape of carboxylic acid and hydrogen, as in the case of butyric fermentation, and the formation of mannite, gum, and lactic acid. It has been described as taking place under the influence of a peculiar ferment composed of minute spherules, which are probably a species of Peptococcus. It is doubtful whether this should be considered as a distinct species, or as an incident in lactic or butyric fermentation.—

7. Putrefactive Fermentation. This occurs when bodies containing nitrogenous compounds decompose spontaneously in a limited amount of air. When the decomposing substance is freely exposed to the air, and there is not too much moisture present, eremacausis or slow combustion takes place (see EREMOCASIS); but if the access of air is much obstructed, as when the decaying body is submerged in water, a more complex reaction takes place, in which several very offensive gases are evolved, prominent among which is sulferretted hydrogen, the gas which gives the odor of rotten eggs. Phosphated hydrogen, carboxylic hydrogen, ammonia, free nitrogen and hydrogen gases, and acetic, lactic, butyric, and valeric acids, as well as several noxious compounds, the nature of many of which is not perfectly understood, are also formed. The putrefaction which takes place soon after the death of a person or animal generates poisonous matter of great virulence. It is, however, the opinion of Dr. Lionel Beale that the peculiar matter which is the most poisonous is engendered at about the time of death, and perhaps a few hours before. ("Disease Germs, their Nature and Origin," London, 1872.) Complete exclusion of air prevents putrefaction. If fermentable liquids are first boiled and sealed tightly in close jars, they may be kept for an indefinite time without undergo ing either vinous or putrefactive fermentation. The commencement of the process is a matter which is involved in some obscurity. A piece of wood or animal tissue undergoing eremacausis, if supplied with sufficient moisture and nearly excluded from the air, immediately begins to putrefy. Whether the ferment is the decaying matter itself, or consists of living organisms, is a question that has not been decided. Pasteur regards putrefaction as a peculiar species of fermentation caused by animal organisms of the genus subrius, of which there are six known species; and he also regards each of them as having the power of exciting a particular mode of putrefaction. If a putrescible liquid holding air in solution is sealed in a glass vessel and left to stand for a time, certain infusoria, monas crepusculum and bacterium terme, are first developed. They absorb oxygen from the air and evolve carboxylic acid, and then die and fall to the bottom as a sediment. If germs of the subrius are present, they become developed, and the process of putrefaction commences. These vibrations, according to Pasteur, cannot exist in a liquid which contains oxygen. If the putrescible liquid is exposed to the air, the monads and bacteria are first developed, and forming a pellicle on the surface prevent the access of oxygen to the interior. Putrefaction then commences, but the products are partially decomposed by the influence of the layer of infusoria, and receiving oxygen are converted into water, carboxylic acid, and ammonia. Pasteur also regards the slow oxidation of animal and vegetable matters, such as moistened sawdust, as dependent upon the influence of the lower cryptogamic and infusorial organisms, without the presence of which he thinks dead organized matter would be subject to but little change.—There is a tendency at the present time to regard all kinds of fermentation as due to the development of living organisms, either animal or vegetable, depending principally upon the nature and condition of the fermenting liquid. According to Pasteur, it is always accompanied by an incessant interchange of molecules between the fermenting substance and the living cells which develop themselves within it. In the souring of wine, a growth of mycodosma aceti forms on the surface, and has the power of condensing the oxygen of the air, like that of platinum black, or of the blood globules, and conveying it to the liquid on which it rests. Pasteur also says that the germs which cause the fermentation of grape juice come from the exterior of the fruit. He finds with the microscope organized corpuscles attached to the grape skins, which he regards as germs of the ferment. He Moreover holds that alcoholic fermentation may be conducted without the presence of atmospheric oxygen, and in an atmosphere composed entirely of carboxylic acid; in accordance with which idea he has invented and patented apparatus for brewing, by which atmospheric air is excluded during fermentation, one great advantage of which he claims is that the germs of other fermentations which produce lactic, acetic, and butyric acids are excluded, and beer yeast or true alcoholic ferment alone allowed to act, by which a greater percentage and also better quality of product is obtained, and in a more economical way. Experiments have been made by Pasteur and others in which boiled must and other fermentable liquids have been sub-
FERMENTATION

ected to the action of filtered and heated air and oxygen without the production of fermentation; and they have also introduced the pulp of fruits into boiled must, with the same result when it was excluded from the presence of unfiltered air. Fermentation happens also to Garron in tubes having their ends closed by thin membranes, and placed in fermentable liquors, but without exciting in the latter any fermentation except when natural air was admitted, which, it is contended, always carries the germs of fermenters. M. Frémy maintains that certain experiments which he has made controvert the position of the upholders of the physiological theory. At a session of the French Academy of Sciences held in October, 1872, a discussion of the subject took place between M. Pasteur and M. Frémy, in which the latter contended that the influence of atmospheric dust in the phenomena of fermentation is only secondary and accidental, and that the true origin of fermenters is in the mass of the fermentable substance. Frémy is disposed to believe that Pasteur did not establish fermentation in the boiled must in which he had placed grape juice, because he placed it in other conditions, besides those of exclusion of air, in which alcoholic fermentation could not take place. He recounted some experiments which he had made, among which was the following: He squeezed the pulp of some pears and other fruits, but without breaking the skins, and placing them in favorable situations, found at the end of several days that they contained notable quantities of alcohol; fermentation having been produced in the interior of the fruit where, in his opinion, the dust of the air could not exert any influence. Frémy therefore believes that the parenchyma of fruits contains the material which is capable of taking on conditions by which it may form fermenters. He contends that there is a great number of fermenters that are neither organized nor living, which are capable of fermenting substances and the action of fermentation, depending upon the conditions in which the fermentable matter is placed. Liebig compares the action of a ferment to that of heat, by which the atomic constituents of organic molecules are broken up and left to recombine under the influence of forces that may be present. Acetic acid is separated by heat into carbonic acid and acetone; just as sugar is separated by yeast into carbonic acid and alcohol. He regards vital action and chemical action as phenomena which must be considered separately in seeking an explanation of fermentation, and holds that the fact that yeast causes fermentation in a pure solution of sugar is opposed to the idea that the decomposition of sugar is caused by the development and increase of yeast cells; for yeast consists chiefly of a substance containing nitrogen and phosphenes and this substance cannot be furnished by the sugar; and moreover, beer yeast causes a similar decomposition of other substances, malt of lime being con-

varted into carbonic acid, acetate, carbonate, and succinate of lime. Salicin is also decomposed by yeast into saligenine and salicylic acid; and a similar decomposition of salicin is produced by emulins without any recognizable physiological process being concerned in the change. Emulins act upon amygdaline in like manner, its effects being recognizable in a few minutes by the new products. Emulsion of sweet almonds also undergoes active vinous fermentation when mixed with grape sugar. But if substances containing sulphur and nitrogen, like emuline, are, by reason of alteration in the arrangement of their atoms, capable of inducing change in other organic molecules, so that they separate into new products, there is reason for suspecting that in the action which yeast exerts upon sugar its sulphuretted and nitrogenous constituent plays a similar part.

On the other hand, the experiments of Hallier are more in support of the views of Pasteur. According to this observer, the same germinal molecules develop, according to the nature of the fermentable substances in which they are deposited, into the fungal forms peculiar to each fermentation. The forms which induce putrefaction, fermentation, and mildew are all varieties of one another. When they are developed within the fluids they are cellular formations, but when they grow upon the surface they produce fructification. Hallier agrees with Pasteur's view that the germs are all carried by the air. The following, condensed from the "Quarterly Journal of Science," is a brief summary of Hallier's views. The most abundant source of germs appears to be the penicilium crustaceum (fig. 4), whose spores are universally spread because it is more hardy, more fertile, and develops at lower temperatures than others of its kind. A spore of penicilium falling into a watery fluid bursts into a multitude of particles, each of which may be the radicle of a living fungus. The minute particles unite in twos, forming a double cell, and grow with great rapidity. (See fig. 5.) The minute particles then unite in chains, constituting lepotrichis, which is not a species, but a form of vegetation common to many species. In pure water development can go no further, and after a few

![Fig. 4. - Fructification of Penicilium crustaceum (Hallier).](image)

![Fig. 5. - Spores of Penicilium crustaceum bursting in water and setting free their contained particles, micrococcii, in rows or chains (Hallier).](image)

hours the organisms cease to be formed, the presence of a nitrogenous substance being necessary for further development. The minute spherules, micrococcii, are the special ferment of putrefaction. In the presence of sugar the spherule enlarges and becomes a nucleated cell,
cryptococcus, which is identical with the yeast cell. (See fig. 6.) In milk, during lacteous fermentation, the \textit{micrococcus} elongates and forms jointed staff-like cells, as in fig. 7, \textit{arthroccoccus}; and in acetic fermentation the cells become lancet-shaped. According to these views, alcoholic

![Fig. 6. Cryptococcus in various grades of development from Penicillum (Hallier).](image)

![Fig. 7. - Arthroccoccus, found in sour milk (Hallier).](image)

and putrefactive fermentations are both due to the influence of a single agent, transported from place to place in the air, which everywhere contains germinal matter, protoplasm, bioplasm, or whatever it may be called; the living molecules growing wherever they find a suitable soil, and in different soils developing into different forms, producing by their vital acts different effects. The microscopic investigations of Dr. Beale upon the development of the yeast plant show that the cells vary in size more than is usually represented, and that the development of buds is greater, the layer cells having as many as ten or more buds. (See figs. 1 and 3.) He says: "The different germinal matter within the yeast cell is the material upon which alone all growth and action depends. Were it not for the bioplasm or germinal matter, the cell would be lifeless and passive, incapable of exciting fermentation or any change whatever; and it may under favorable circumstances undergo development into complete yeast cells, so that the artificial division of one thousands may result. And if the soft, bioplasmic matter which can be expressed from the yeast cell be placed under favorable conditions, every particle of it may germinate. This matter alone furnishes the germs, it alone grows and appropriates the nutrient material; in short, it alone manifests the phenomena peculiar to living things. The little buds or germules above referred to, detached from the parent mass, and capable of independent existence, are, many of them, much less than \textit{\textlessthan} an inch in diameter; but each is living, and will grow under favorable circumstances into a body like the parent cell, giving origin in its turn to countless descendants. These very minute particles divide and subdivide independently, producing still more minute particles, capable of growth and division like themselves; . . . and this mode of multiplication may go on for a long period, perhaps for an indefinite time, if certain conditions persist. But if any one of these excep-

sively minute particles falls into a medium containing suitable palbum, it will appropriate it and soon pass on to a higher stage of development. In this case branches may be formed, and from them may proceed stems which grow upward into the air, and bear upon their summit heads in which spores are found, these last being so well protected from the influence of destructive agents that the germinal matter within can retain its vitality for a great length of time. The spores just referred to are so light as to be easily supported in the atmosphere, and they may be carried a long distance by currents of air." Béchamp has made an investigation into the action of chalk which is used in lactic and butyric fermentation. As has been stated, the chalk is added for the purpose of preventing an accumulation of acid in the solution; and although this is an important action, Béchamp has shown that chalk is itself capable of establishing alcoholic, lactic, and butyric fermentations. The chalk formation consists principally of the remains of minute organisms; but independently of these fossils, he finds that chalk contains living organisms of extreme minuteness, which he has named \textit{microsoma creta}, and regards as the most powerful fermenters known. A sample of native chalk, taken from the centre of a large block and mixed with water, reveals under the microscope numerous bright points having very lively trepidating movements, which are the organisms in question. The following experiment shows their power of inducing fermentation: There were intimately mixed 420 grms. of starch paste, 30 grms. of chalk, and 4 drops of creosote. At the same time a similar mixture was made, except that pure carbonate of lime was used in place of chalk. In three days the starch in the mixture containing chalk was liquefied, but no change was produced in the one containing pure carbonate of lime. On November 18, 1864, 100 grms. of starch, 1,500 cc. of water, and 10 drops of creosote were mixed with 100 grms. of chalk. On March 30, 1866, the mixture was analyzed and found to contain 4 cc. of absolute alcohol, 8 grms. of butyric acid, and 5-2 grms. of crystallized acetate of soda. On April 28, 1865, 80 grms. of cane sugar, 1,400 grms. of chalk were mixed with 1,500 cc. of water containing creosote, and when examined on June 14 following yielded 2-6 cc. of absolute alcohol, 4-5 grms. of butyric acid, 6-8 grms. of acetate of soda, and 9 grms. of lactate of lime. When proper precautions are taken no other ferment is found in the liquid after fermentation besides those contained in the chalk, and which have become considerably augmented.—Fermentation is retarded or arrested by the action of various substances. A mass of chalk, containing from 8 to 15 per cent. of alcohol in the process arrests it. Lactic fermentation is also arrested when a certain quantity of lactic acid accumulates. Sulphurous acid, even in small quan-
FERMENTATION

FERMOY

ten and others with boiled fermented liquors. It is asserted that they may be preserved for an indefinite time if filtered air or pure oxygen only is admitted into the vessel. Now, Payen found that certain organic spores did not lose the power of germination till heated to 284°F.; and others maintain that organic germs will retain their vitality at much higher temperatures than this. It is certain that the decomposition of the proteine body is arrested by boiling, so that its influence is destroyed; but it is quite probable that germs which have hitherto escaped detection by means of the microscope may yet remain alive. If, therefore, it be a fact that boiling will for an indefinite time preserve a fermentable liquor when natural air is excluded, this would seem to indicate that something more than the presence of organic germs is necessary to induce fermentation, such as proteine compounds in a certain state of change, the peculiar action of which, however, may be advantageously manifested in the presence of yeast or some living organism. The facts also that brewers find in their practice that yeast does not exert its powers advantageously unless, before being added to the fermenting tun, it be kept in a warm place till incipient putrefaction takes place, and that washed yeast when added to wort does not produce fermentation until a certain time has elapsed, strengthen the opinion. The fact, however, that, although undecomposed proteine compounds may be contained in the boiled liquor, they will not begin to decay in the presence of filtered air or pure oxygen, but require the admission of natural air, would indicate that they also require the presence of some body having a chemical or catalytic force not possessed by pure oxygen, which is removed from the atmosphere by filtration.

FERMO (anc. Firmum Picenum), a town of Italy, in the province of Ascoli, 83 m. S. E. of Ancona, and 3 m. from the Adriatic; pop. about 20,000. It is the seat of an archbishop, has a cathedral and seven other churches, a lyceum, a communal gymnasium, a public library, and a theatre. It exports corn, silk, and woollens. It was founded by the Sabines before Rome existed, and became in 264 B. C. a Roman colony. From the 8th century it generally belonged to the papal dominions till 1860, when it became part of the kingdom of Italy. It is the birthplace of Lactantius.

FERMOY, a town of Ireland, in the county and 19 m. N. E. of the city of Cork, on both sides of the Blackwater, which is here spanned by a fine stone bridge, built in 1866; pop. in 1871, 7,611. At the beginning of the present century there were here only a few cabins, until Mr. John Anderson, the owner of the estate, built a hotel, and erected for the government barracks sufficient for 8,000 men. Fer moy thus became the central military station of Ireland. Mr. Anderson also laid out streets and built houses which constitute the greater part of the town. It has a Roman Catholic
cathedral, several Protestant churches, two colleges (Fermoy college, and St. Colman’s Roman Catholic college), two convents, and three branch banks.

**FERN, Male.** See Male Fern.

**FERNANDINA,** a port of entry and the capital of Nassau co., Florida, situated on the W. shore of Amelia island, at the entrance of Amelia river, which separates it from the mainland, into Cumberland sound, 160 m. E. by N. of Tallahassee; pop. in 1870, 1,723, of whom 959 were colored. The harbor is land-locked and capacious, and is unsurpassed on the Atlantic coast S. of Chesapeake bay. Vessels drawing 19 or 20 feet of water can cross the bar at high tide, and the largest ships can unload at the wharves. The climate, mild in winter and tempered in summer by the sea breezes, is very healthful. In the vicinity are numerous sugar, cotton, and orange plantations. The town, which is the seat of the Protestant Episcopal bishopric of Florida, contains seven churches, a young ladies’ seminary under the charge of the bishop, and a weekly newspaper. It has an important trade in lumber, and possesses a large cotton-ginning establishment and a manufactory of cotton-seed oil. Lines of steamers to Savannah, Charleston, and New York touch here. The value of the foreign commerce for the year ending June 30, 1873, was $327,859; 63 vessels of 14,789 tons entered from, and 68 of 22,217 tons cleared for foreign ports; entered in the coastwise trade, 112 steamers of 77,708 tons, and 105 sailing vessels of 28,498 tons; cleared, 110 steamers of 76,392 tons, and 106 sailing vessels of 26,021 tons. Fernandina was built by the Spaniards in the early part of this century, but was of little importance until the completion of the Florida railroad, extending from this point to Cedar Keys.

**FERNANDO DE NORONHA,** a group of small islands in the Atlantic ocean, belonging to Brazil, situated about 210 m. N. E. of Cape St. Roque; lat. of S. E. extremity of the principal island, 8° 50′ S., lon. 82° 28′ W. The shores are rocky, and difficult of access on account of the violence of the surf. The largest island, which gives the name to the group, is about 20 m. in circumference. In it is a conical mountain about 1,060 ft. high, the upper part of which is bare, and on one side overhangs its base. It is composed of phonolitic rock, which has been severed into irregular columns. The island is covered with wood, but such is the aridity of its climate, there being sometimes no rain for two years, that vegetable production is very limited. It contains two harbors, and the coasts abound with fish. It is used as a place of banishment by Brazil, whose government maintains a garrison there to prevent the escape of criminals. No woman is permitted to land on it. Another of these islands is about 1 m. square, and the rest are mere rocky islets, separated from the main islands by very narrow channels.

**FERNANDO PO (Port. Fernão do Po),** an island in the bight of Biafra, W. coast of Africa, about 25 m. from the mainland, lying between lat. 3° 12′ and 8° 47′ N., and lon. 8° 26′ and 8° 57′ E.; pop. variously estimated at from 5,000 to 20,000. It is about 44 m. long and 20 m. broad. Rising in bold precipitous cliffs from the sea, its surface gradually becomes more and more elevated, until in Clarence peak, near the N. extremity, it attains an altitude of 10,650 ft. The rocks are wholly of volcanic formation. The soil, which is mostly covered with wood, is everywhere well watered and fertile. The scenery is picturesque and beautiful, the highest summits and the deepest vales being alike adorned with luxuriant vegetation. The principal vegetable products are palms, the bombax or silk cotton tree, the goora (sterculia), a species of ebony, the sugar cane, here growing wild, and yams, which form the staple food of the inhabitants. The most numerous quadrupeds are antelopes, monkeys, squirrels, and rats. The rivers abound in fish and alligators. The coast is indented with several creeks and bays, the most capacious of which is Maidstone bay, at the N. E. extremity, where is situated the capital, Clarence-town. The aborigines of Fernando Po, called Edesybas, are widely different in appearance and language from the natives of
the continent. They are of lighter complexion and better features, well made and muscular, and in disposition brave, generous, and amiable. Their dwellings are of very rude construction, consisting merely of palm-leaf mats thrown loosely over upright poles.—This island was discovered by the Portuguese in 1471, and named after the leader of the expedition. In 1778 it was ceded to the Spaniards, who attempted to colonize it and carry on a slave trade, but were repelled by the natives. In 1827 Spain permitted it to be occupied by the British, who in 1884 abandoned it on account of its insalubrity; since which period the Spaniards have again claimed it and changed its name to Puerto de Isabel, and now use it as a place of banishment for criminals. During the British possession a Baptist mission was established here; but in 1858 the missionaries were expelled by the Spanish government.

FERNEY, or Ferno, a town of France, in the department of Ain, on the frontier of Switzerland, at the foot of the Jura mountains, 5 m. N.W. of Geneva; pop. about 1,200. It was a place of refuge for the Huguenots during the era of religious persecution in France, and was for 20 years the residence of Voltaire. When he bought the land, about 1758, Ferney was a miserable hamlet, consisting only of a few hovels. By his exertions it became a prosperous town, with nearly 1,500 inhabitants. He drained and cultivated the adjacent grounds, and caused Geneva watchmakers and other industrious artisans to settle there, while the constant concourse of visitors and travellers contributed to enhance the general prosperity. The death of Voltaire proved disastrous to the industry of the place, the persons employed in the manufacture of watches being reduced from 800 to about 200. The château in which he lived has undergone many alterations, so that few relics of him remain. Adjoining the château are two small residences, one the theatre and the other the church built by Voltaire. Upon the porch of the latter is the following inscription: *Deo erexit Voltaire.* In front of the château is the mausoleum which he had built with the utmost attention to artistic execution.

FERNIC, Félicité and Théophile de, French heroines, sisters, born at Mortagne, department of Le Nord, Félicité in 1778, Théophile in 1779. They distinguished themselves by bravery on many occasions, especially at the battles of Valmy and Jemmapes, having enlisted without their father's knowledge in a company of national guards which he commanded in 1792. Their services were officially recognized, and are commemorated in Lamartine's "History of the Girondists." Théophile, who has assumed the pen name of Talleyrand, died in Brussels in 1818. Félicité is the wife of M. Van der Walen, a Belgian officer, whose life she has saved, and she died much later.

FENKORN, Anton Domenik, a German sculptor and bronze founder, born at Erfurt, March 17, 1818, died Nov. 16, 1878. He spent a number of years in a foundery at Munich, and attended the academy of Schwantshaler. In 1840 he settled in Vienna, and having produced several excellent works was made director of a government bronze foundery. Among his best productions are the colossal equestrian statue of the archduke Charles, finished in 1860, and the monument to Prince Eugene in 1865. In 1866 he became insane, and was placed in a private asylum at Döbling, near Vienna.

FERNs, the highest order of cryptogamous plants, forming a natural group distinguished for beauty and elegance, and much cultivated for ornament. Ferns are leafy plants producing a stem or rhizome, which creeps below or upon the surface of the earth, and sometimes rises to the height of 50 ft. as a tree trunk, crowned with terminal leaves or fronds. The rhizome is a fibrous woody cylinder, growing only at the end, and so of equal diameter throughout, giving out roots anywhere on its surface, and presenting on a cross section a hard fibrous ring composed of the angular bases of fallen fronds, enclosing a cellular tissue with a ring of woody plates, folded and curled, which are in fact the bases of the leaf stalks, and in the centre a cellular mass or highly developed pith. The stem is in fact a consolidated bundle of leaf stalks. The frond is circinate or coiled in vernalation, and when unfolded is often of great size (30 ft. long). From this and the minute subdivision of the frond it has been considered rather a leaf-bearing branch than a proper leaf; but there are all gradations from an entire frond to one most minutely divided, and in the latter case the membranous portion proves on examination to be one, however deeply incised. The petiole is never sheathing or articulated at the base, although in some tropical species the base is much enlarged and forms an elastic joint, quite edible. The size of the fronds varies from a diameter of less than a quarter of an inch to an expansion unequalled by any other vegetable except some seaweeds. In several cases buds spring out on the surface or edges of the frond, and thus multiply the species; this is the case in the walking fern, *Campioereus,* where the tip of the elongated hastate frond bends to the earth and takes root, giving rise to new plants. The veins of the pinnae or leaflets of the fronds are variously arranged, and usually so definitely in each genus as to be used in generic distinctions. The fructification of ferns is always on the lower face of the fronds, which sometimes under its influence are reduced to simple supports in the shape of a spike or panicle; it consists of sporangia or capsules, each containing many spores, and usually attached to the nerves or veins, but sometimes covering the entire surface. These capsules are generally in clusters of various forms called *sori,* and each cluster is often covered until ripe by a fold of the leaf membrane called an *indusium.* The order of ferns is divided into suborders, most botanists...
recognizing as many as eight, founded upon the structure, manner of attachment, and mode of opening of the sporangia. By far the largest of these suborders is the polypodiaceae, or true ferns, which includes the great majority of those with which we are familiar in the wild

![Rock Fern (Polypodium vulgare)](image)

state or in cultivation. In ferns of this suborder the structure of the sporangium is curious. A little bundle of cellular pores on a stem of the same cell formation is clasped around by a ring of thick and elastic segments, each resembling a U with the rounded part inward and the sides united. While the sporangium is alive and full of sap the arms of the U

![Hart's Tongue (Scolopendrium officinarum)](image)

remain almost parallel; but as the ring dries the arms shrink together, and the capsule is ruptured, often with force enough to throw the minute spores to some distance. The position of the sporangia on the frond is an important generic distinction. In the common rock

![Maiden-hair (Adiantum pedatum)](image)

fern (polypodium) they are round, cinnamon-colored dots in rows each side of the midrib; in hart’s tongue (scolopendrium) they form numerous obliquely transverse lines; in maiden-hair (adiantum) a bit of the edge of the frond folds over the capsules; in the brake (pteris)

![Common Brake (Pteris aquilina)](image)

the whole edge is folded over; and in the asplenium and many other ferns the sporangia are in oblong masses pinnately arranged each side of the midrib of the smaller divisions of the frond. In hymenophyllum, of a different suborder, the capsules are contained in a calyx-like urn springing from the terminal veins. In the ophioglossaceae, which include our com-
in which ferns are founded is a modern discovery, but the process may be watched under the microscope by sowing the spores of any common fern in a moist place. The spore swells with the moisture and ruptures its walls; a little radicle or rootlet is thrown out, consisting of a single cell, and at the same time another cell spreads out as a tube of irregular form, which soon forms partitions through its mass, and by multiplication of these cells becomes a small green leaf-like expansion called a prothallus. On the under surface of this spring organs of two kinds, the antheridia and archegonia. The former are filled with minute spiral bodies called antherozoids, which have cilia and the power of motion in water, which is always abundant on the under side of the prothallus; when mature they pass into the archegonia, which are cup-like organs, open when mature, and containing one or more cells which the contact of the antherozoids causes to develop, and soon a root appears, then the first frond, and so on until the complete fern is the result.—The species of ferns at present described are 2,385, although some botanists make the number above 3,000. In the earlier geological ages ferns formed a most important part of the vegetation, as is plainly seen in the coal fields, where numerous fronds and stems are preserved; but from the general absence of fructification on these remains, it is often impossible to distinguish the species. They are now found all over the world, but especially in the warmer and moister climates; thus in the Antilles they comprise $\frac{1}{3}$ of the vegetation, in Oceania $\frac{1}{4}$ to $\frac{1}{4}$, in St. Helena $\frac{1}{4}$, in Juan Fernandez $\frac{1}{4}$, and in England $\frac{1}{3}$. The Hawaiian islands and New Caledonia are particularly rich in species. The tree ferns are chiefly confined to the torrid zone, but Martens found them 60 ft. high in Japan, and Robert Brown found arborescent ferns at the extremity of Tasmania, and even at Dusky bay in New Zealand, near lat. 46° S. Most tree ferns are easily propagated by planting sections of their stems, which readily leaf out. —For the classification of ferns, which is very unsettled and depends on technical differences, see Hooker's "Genera," Hooker and Baker's "Synoptical Ferns, British and Foreign." and for local descriptions see local floras. —The uses of ferns are not very prominent. On the Hawaiian islands the stem of a tree fern is often baked in the steam cracks of the volcanoes, and by long cooking becomes quite palatable, although rather leathery, and tasteless without salt. The enlarged bases of the petioles of other species are cooked and eaten in times of scarcity; when raw they smell precisely like a raw potato. The stems and midribs of some smaller species are woven into baskets and hats. A few species are considered medicinal, and some are aromatic and used to scent cocoanut oil,—In cultivation ferns may be adapted to a variety of localities; for, although generally found in shady places, many thrive in the full tropical sun if the air be moist, and some grow on dry rocks and even on the uninviting surface of lava.

Tree Ferns.

streams. A compost of peat or bog earth, decayed leaf mould, yellow loam, and silver sand in equal proportions, may be used in potting ferns; but it must be well underdrained, and the addition of a few fragments of mortar or limestone is advantageous. Several species climb on rocks, like ivies; others cling to trees, or, like the beautiful climbing fern (lygodium), run over bushes. About 1880 Mr. N. B. Ward of England, in investigating the transformations of an insect, buried its chrysalis in some earth in a closed glass bottle. A seedling fern and a grass sprang up from the soil and grew within the confined atmosphere of the
vessel. This led to experiments upon the growth of plants, especially ferns, in close cases, and resulted in establishing the fact that these plants would not only grow under such conditions, but that most ferns would flourish much better than in the open air. Wardian cases, which resulted from this discovery, are now in general use for the cultivation of ferns, and are among the most popular as they are the most beautiful of household ornaments.

FÉRON, Firmin Éloi, a French painter, born in Paris, Dec. 1, 1802. He studied under Gros, and received the great prize in 1825 for his picture of “Damon and Pythias.” Among his subsequent works are “Hannibal in the Alps” (1833), “The Resurrection of Lazarus” (1835), and “Christ arrested by Judas” and “Souvenir of Tunis” (1855). Many of his pictures are in the museum of Versailles, and he was a favorite painter of Louis Philippe and his sons; but his reputation has declined.

FERROZEPPO, a town of British India, in the Punjab, about 3 m. S. of the river Ghara, 45 m. S.S.E. of Lahore; pop. about 10,000. The ruins which surround it show that it was once a large city. It came into possession of the British in 1835, since when it has been greatly improved, and bids fair to become of considerable military and commercial importance. In May, 1837, during the sepoy rebellion, a regiment of native infantry revolted, but were driven out of the fort by a handful of Europeans, and fled after plundering and burning the houses, hospitals, and church. In August following a regiment of cavalry revolted, but after killing several persons were repulsed and dispersed.

FERRAND, Antoine François Claude, count, a French politician and historian, born in Paris, July 4, 1751, died there, Jan. 17, 1825. At the age of 18 years he was admitted a counselor in the parliament of Paris by special dispensation. He left Paris in 1789, and attached himself to the prince of Condé; and after the death of Louis XVI. he was appointed a member of the council of regency. He returned to France in 1801, devoted himself to literature, and published a work, on which he had been long engaged, entitled De l'esprit de l'histoire, which was a bold defence of absolute monarchy. He was engaged to complete Rulhière's unfinished Histoire de l'anarchie de Pologne et du démembrement de cette république; but the imperial police prevented the publication on the ground that the work belonged to the government, it having been originally written for the instruction of Louis XVI., then dauphin. After the restoration of the Bourbons he was appointed minister of estate and postmaster general. He was a member of the academy, and author of several dramatic and a large number of political works, the latter of which were conservative and many of them reactionary in their tendency.

FERRARA. I. A province of Italy, formerly a part of the Papal States, bounded N. by the main branch of the Po, which divides it from Lombardy, E. by the Adriatic, S. by the provinces of Ravenna and Bologna, and W. by Modena, from which it is partly separated by the river Panaro; area, 1,009 sq. m.; pop. in 1871, 215,369. The surface is flat, and in many parts below the level of the Po, and protected from inundation by embankments along the river. A considerable portion of the E. part of the province is almost constantly under water. In June, 1873, there was a terrible inundation by which 20,000 people were rendered homeless. The soil is rich and fertile, but the vast swamps render the atmosphere more or less unwholesome, especially in summer. The chief products are grain, rice, flax, hemp, wine, olives, and silk. Extensive pastures favor the rearing of cattle, and the fisheries are of some importance. The province formerly constituted the greater part of the duchy of Ferrara, which was ruled by the house of Este from the early part of the 13th century to 1808, when it was annexed to the Papal States. In 1796 it was taken by the French and formed part first of the Cisalian republic, and afterward of the kingdom of Italy, till 1814, when it was restored to the pope, with the exception of a small portion between the Po di Goro and the Po della Maestra, which was secured to Austria by the congress of Vienna, together with the right of garrisoning the citadel of Ferrara. The province was governed by a papal legate or cardinal, and was called a legation, until November, 1850, when it came under the administration of an inferior prelate. In June, 1859, the Austrian troops were withdrawn from the capital, and in March, 1860, it was annexed to the kingdom of Sardinia. The principal towns besides the capital are Lugo, Cento, Bagnacavallo, and Comacchio, the last a fortified town, situated on an island in the midst of extensive swamps, and noted for its fisheries, which are celebrated by Tasso and Ariosto. II. A city, capital of the province, situated in a flat unhealthy country, only about 7 ft. above the level of the sea, on the left bank of the Volano, branch of the Po, about 5 m. S. of the main channel of that river, 26 m. N. E. of Bologna and 30 m. N. W. of Ravenna; pop. as a commune, in 1871, 78,447, of whom less than one half were in the city proper. Ferrara was a small village until the beginning of the 7th century, when it was walled by the exarch of Ravenna. The bishopric of Ferrara dates from 661, the archbishopric from 1785. A general council was convened here in 1488, but was removed to Florence. (See Eugenius IV., and Florence, Council of.) Under the rule of the princes of Este the city gained great importance, especially in the 16th century, when it was celebrated for learning, poetry, art, and the refinement and splendor of its ducal court. In the 16th century it was famous for its school of painting. In the early part of the 16th it gave an asylum to Calvin.
and other religious reformers. Guarini, Boiardo, Ariosto, and Tasso were among the most illustrious ornaments of its court. The city had in its most prosperous period about 100,000 inhabitants. It still retains many vestiges of its former splendor. The churches contain fine works of art, especially that of the Campo Santo, which occupies the site of the old Certosa convent. The cathedral of St. Paul was consecrated in 1185, and contains the tomb of Urban III. Santa Maria del Vado is the oldest church, but has been entirely altered by modern restoration. That of San Francesco is famous for its echo, which has 18 reverberations. Ariosto was buried in the church of San Benedetto, but in 1801 his remains were removed to the public library.

The finest of the palaces of Ferrara are the Diamond palace, or Villa Ercole, and the palazzo del Magistro, where the accademia Ariostea holds its sittings. In the hospital of Santa Anna a small room on the ground floor is still shown in which Tasso is said to have been confined as a lunatic for many years by Alfonso II., but the identity of this room with his place of confinement is now very generally disbelieved; and near the city is the villa Bel Rigardo, where the poet enjoyed the churches of Eleonora of Este. The university of Ferrara was founded in 1391, renovated in 1409, closed in 1797, and reopened in 1824. It was again closed during the revolutionary troubles of 1848-49, and reopened Nov. 1, 1850, after the reestablishment of the papal authority. It is chiefly renowned as a school of jurisprudence and medicine, and is attended by 200 to 800 students. It contains a collection of antiquities, a library of 80,000 volumes and 94 MSS., comprising some of Guarini, Ariosto, and Tasso, and many valuable editions of the 15th and 16th centuries. Ferrara possesses one of the finest and largest theatres of Italy, a botanical garden, and many charitable institutions and convents. In the centre of the city is a castle flanked with towers and surrounded by wet ditches, which was formerly the palace of the dukes. The population is chiefly collected in the vicinity of this castle, and but thinly scattered elsewhere. The city is enclosed with walls and defended on the west by the citadel. The Austrians took possession of the whole city in August, 1847, but the troops were withdrawn in December, and the Austrian occupation remained confined to the citadel until July 14, 1848, when the city was again seized by Prince Liechtenstein. On Feb. 18, 1849, it was occupied for a short time by Gen. Haynau, who imposed upon the inhabitants a contribution of 200,000 scudi. In June, 1859, after the battle of Magenta, the Austrian forces withdrew from the citadel, and it was destroyed.

Ferrari, Canezio, a painter of the Milanese school, born at Valdaggia in 1484, died in Milan in 1550. His principal works are illustrative of the story of creation and of the early events of Christianity, and are found in the galleries and churches of Lombardy. He was also a sculptor, architect, mathematician, and poet.

Ferrari, Giuseppe, an Italian philosopher and historian, born in Milan in 1812, died there, July 5, 1876. In 1881 he graduated as a doctor of law at Pavia, but devoted himself to literature and philosophy, and became a disciple of Romagnosi. In 1888 appeared his complete edition of the works of Vico, reprinted in 1889, in Milan, in the collection of Italian classics. In 1887 he went to France, and published in 1889 Vico et l'Italie. In 1840 he became professor of philosophy at the college of Rochefort, and afterward at Strasbourg, but soon lost his office on account of his radicalism. In 1847 he published Essai sur le principe et les limites de la philosophie de l'histoire, his most important work. After the revolution of Feb. 24, 1848, he was reinstated in his chair at Strasbourg; but the disiate of the French clergy followed him there, and to Bourges, whither he removed at the end of that year, and they eventually succeeded in procuring his dismissal (June 18, 1849). In 1859 he returned to Italy and became a member of parliament, and successively professor in Turin, Milan, and Florence. Ferrari was the foremost Italian representative of positivism, and attempted a philosophical reconstruction of the political development of nations, founded exclusively upon experience and induction.
FERRARI, Luigi, an Italian sculptor, born in Venice in 1810. He studied under his father Bartolommeo, an eminent artist, and was early employed in connection with Canova's monument to Titian. In 1827 he exhibited his first work, a statuette of the Virgin; and since 1851 he has been professor of statuary at the academy of fine arts in Venice. Among his principal works are "Laocoön," in the museum of Brescia; two figures representing a "Nymph collecting Lotus" and "Melancholy;" and marble statues of King David, of the Madonna della Concezione, of Marco Polo, and of St. Justus, in Trieste. He has executed many funeral monuments, and busts and statues of angels, nymphs, and children.

FERRE, Théophile Charles, a French communist, born about 1845, executed at Satory, near Paris, Nov. 23, 1871. He was a merchant's clerk, and was early implicated in revolutionary movements. During the insurrection of March, 1871, he favored the assassination of Gens. Lecomte and Clément-Thomas, and became a member of the commune and of the commission of public safety, adjunct procurator general, and prefect of police. On May 27 he presided over a massacre of hostages, after having released and armed the inmates of the penitentiary and converted them into executioners. One of the most ferocious terrorists, he set fire to the prefecture of police, and ordered the burning of the ministry of finance. Previous to his execution, he wrote to his sister that he died as he had lived, a materialist.

FERRARE, Antônio, a Portuguese poet, born in Lisbon in 1828, died there of the plague in 1869. He was a contemporary of Camoëns, and perfected the elegiac and epistolary style already introduced with success by Sa de Miranda. He enriched Portuguese poetry with the epithalamium, the epigram, ode, and tragedy, and the influence which he exerted in kindling a love for classical scholarship caused him to be called the Horace of Portugal. His Poemas líricos, which are distinguished by remarkable purity of language, appeared in 1898, and his complete works in 1771. His best comedy is Comédia do cisto (the "Jealous Man"), and his masterpiece is the tragedy of Ines de Castro. An English translation of this tragedy, by Mr. Musgrave, appeared in 1825.

FERRET, a carnivorous digitigrade animal, belonging to the weasel family, and the genus putorius (Ouv.). The dentition is: incisors, 4; canines, 4; molars, 3½. Two above and three below being false molars. Since the time of Helmboldt the ferret has been generally considered a southern or albin variety of the polecat (P. fætidius, Klein), principally from their producing offspring together; but they may more properly be considered distinct species for the following reasons: the ferret is a native of Africa and warm regions, and only exists in Europe in a domesticated state, being very sensitive to cold, and requiring the protection of man; its size is smaller, its shape more slender, and its snout sharper than in the polecat; and its habits, though quite as sanguinary, do not enable it to live wild in the woods. The length of the ferret (P. færo, Linn.) is from 12 to 14 in. from nose to base of tail, the latter being about 5 in. long. It is an error to suppose that the ferret is always white, with pink eyes, as such individuals are only albin varieties, such as occur in many other animals; the general color is an irregular mixture of yellow and black, the fur being long and fine, with an undergrowth of cinerous woolly hair; the yellowest animals are most subject to albinism. Both sexes are alike in color, but the male is the larger, being about 3 in. high at the shoulder and 4 in. at the sacrum. Though ranked as a domesticated animal, and employed by man to hunt rabbits and rats, it is far from docile or gentle, and never seems to have any affection for those who feed and take care of it. According to Strabo, it was introduced from northern Africa into Spain, whence it has spread over Europe. In its natural condition it has the habits of the polecat and weasels, sucking the blood of small quadrupeds and birds, and devouring eggs; it is nocturnal, sleeping nearly all day; in captivity it is fed on bread and milk and raw meat. It produces young twice a year, and from five to eight at a time; gestation is about six weeks, and the young are said by F. Cuvier to be born hairless and with closed eyes, and to be frequently devoured by the mother. Its natural emmity to the rabbit has been taken advantage of by man, who trains it to enter the burrows of these animals, and to drive them out into nets spread over the entrance; the ferret is muzzled to prevent it killing the rabbit, otherwise it is believed it would suck their blood, and go to sleep in the burrow. It will also soon rid a house of rats and mice. For these reasons the ferret is cared for by man, without whose aid it would not survive in Europe; it is carefully bred in
FERRIER, and sometimes crossed with the polecat, which is supposed to increase its ferocity. The ferret is easily irritated, and the skin emits a strong disagreeable odor. It is generally believed that the ferret kills by sucking the blood of its victims, aiming at the jugular vein or the great vessels of the neck; but the rapidity of the death is entirely inconsistent with so long a process as this. Experiments have shown that the ferret often inflicts but a single wound, which is almost instantly fatal, and frequently immediately disengages itself from the body of its victim to attack and kill another in a similar manner; the single wound is in the side of the neck, under or behind the ear, and may or may not pierce the large blood vessels; the canines enter the spinal cord between the skull and the first vertebrae of the neck, destroying its victim by the same process as the bull-fighter with his keen sword, or the Spanish executioner with the steel point of the garrote, making neither a lacerated nor a constricted wound, but penetrating into the medulla oblongata, the very centre of life, instantly arresting the action of the heart and respiratory muscles, and at once destroying consciousness, sensation, and motion. This is one of many instances in which the instinct of animals has anticipated the slow deductions of science. The truth seems to be that when the animal is of small size, it is killed by the ferret by wounding the upper part of the spinal cord; but that when it is of superior size and strength, the ferret seizes it wherever it can, producing death by loss of blood, pain, and exhaustion of strength. After the animal is dead, the ferret, like other weasels, no doubt sucks its blood, though the statement generally made in works on natural history, from Buffon to F. Cuvier and Geoffroy Saint-Hilaire, that death is uniformly caused in this way, is untrue.

FERRIER, James Frederic, a Scottish metaphysician, born in Edinburgh in November, 1808, died at St. Andrews, June 11, 1864. He was a nephew of Miss Ferrier the authoress, graduated at Oxford in 1832, and was admitted the next year to the Scottish bar. He married a daughter of Prof. James Wilson, whose collected works he subsequently edited; and he early contributed to "Blackwood's Magazine" essays on philosophical and literary subjects. In 1842 he was elected professor of history in the university of Edinburgh, and in 1845 of moral philosophy at St. Andrews. His lectures and conversation displayed great learning, independence of thought, and felicity of expression, and he was one of the ornaments of the intellectual circles of Edinburgh. His principal work, "Institutes of Metaphysics: the Theory of Knowing and Being," appeared in 1854; and his "Lectures on Greek Philosophy" and other philosophical remains were edited by Sir A. Grant and E. L. Lushington (2 vols., 1866). He attempted to construct a system of idealism, which however has found few if any disciples; but he called attention to many vital principles of thought, and Ueberweg accords to him in his "History of Philosophy," a rare preeminence among English philosophical writers.

FERRIER, Susan Edmonston, a Scottish novelist, born in Edinburgh about 1782, died there in November, 1854. Her works, all published anonymously, are: "Marriage" (1818), "The Inheritance" (1824), and "Destiny, or the Chief's Daughter" (1831). She possessed a rare ability for delineating national characteristics, genial wit, and a quick sense of the ludicrous. Sir Walter Scott pays a tribute to her talent at the conclusion of his "Legend of Montrose." She was his frequent guest at Abbotsford, and contributed by her society to relieve the sadness which clouded the last days of his life. She was never married.

FERRIERS, a village of France, in the department of Seine-et-Marne, 15 m. E. of Paris; pop. about 800. In the 17th century it was a marais quarried, afterward belonged to Fouché, and was finally purchased by Baron Rothschild, for whom the English architect Paxton built here one of the most magnificent châteaux in France, in the style of the last period of Italian renaissance. From Sept. 19 to Oct. 5, 1870, it was the headquarters of King William of Prussia. An interview between Jules Favre and Bismarck took place there immediately after the arrival of the king.

FERRO, or Herr, the most westerly and smallest of the Canary islands, in lat. 27° 40' N., lon. 18° W.; length 18 m., greatest breadth 9 m.; area, about 100 sq. m.; pop. about 4,600. The ancient geographers supposed this to be the westernmost point of the world, and they drew through it the first meridian; they are deceived by the Germans (who place it at 17° 40' from Greenwich), and others of eastern Europe who follow them. Chief town, Valverde.

FERROL, a seaport city of Spain, on the N. arm of the bay of Betanzos, in the province and 12 m. N. E. of the city of Corunna; pop. about 23,000. Its harbor, which is defended by Forts Palma and San Felipe, is one of the best in Europe. The town is well built, and protected on the land side by formidable fortifications. It has an immense marine arsenal, covering nearly 24 acres, with a basin and docks, which are among the finest in Europe. The marine barracks afford accommodation for 6,000 men. In connection with the arsenal there is a school for seamanship and engineering; there is also a naval observatory. Ferrol has a few manufactures, but being a military port, foreign merchant vessels are excluded from it. It was but a small fishing town prior to 1752, when its fortifications were begun by Ferdinand VI. The English failed in an attack upon it in 1799, but it was taken by the French in 1809 and 1828.

FERRU M. See Iron.

FERRY, a place where persons, animals, or goods are carried across a river or other water; in law, a liberty or franchise so to
transport persons or things. Such a franchise can exist in England only by grant from the king, or by a prescription which supposes a grant; and being granted and accepted, the grantee is indictable if he have not suitable means of transport. In the United States, ferries are created as well as regulated generally by statute, although there may be ancient ferries resting on usage and prescription. The termini of the ferry are at the water's edge, and shift with that if it varies; but the owner has a right of way to and from the ferry. Ferrymen are common carriers, and have the rights and come under the obligations of common carriers.

Thus, they may determine (within reasonable limits) when and how often, and upon what terms, their boats shall cross the water, and what they will transport; but all these things they must do by general rules, without favoritism or arbitrary exception. They are liable for all loss of or injury to property in their possession, unless it be caused by the act of God or of the public enemy. This liability does not attach when persons or things are coming toward or going from their boats, but begins as soon as they are on the boat, or on the slip or flat, and continues while they are there. One who owns a ferry, and employs persons to do all the labor and the actual transport, is in law the ferryman, and liable accordingly. But if he leases the ferry, reserving only his rent, the lessee in possession, and not the owner, is the responsible ferryman; and this is true even if the rent reserved be a certain proportion of the receipts.

Fersen, Axel, count, a Swedish soldier, born in Stockholm about 1750, killed June 20, 1810. He was educated at the military academy of Turin, and entered the Swedish army, but afterward went to Versailles, and was made colonel of the royal regiment of Swedes, the body guard of Louis XVI. He served in the American revolutionary war with distinction, and was aide-de-camp of Rochambeau at Yorktown. Upon his return to France he became a devoted adherent of the Bourbons, and Marie Antoinette especially distinguished him. In the flight to Varennes Fersen was the disguised coachman of the royal fugitives. After their capture he escaped, and was employed by Gustavus III. in furthering the project of reinstating the Bourbon dynasty in France. Toward the end of his life he became the favorite of Charles XIII., and his sister enjoyed in an equal degree the favor of the queen; but both were unpopular with the people. Fersen was made grand marshal of the kingdom; but the sudden death of the crown prince, Christian Augustus of Augustenburg, gave rise to suspicion that Fersen had poisoned him. A tumult occurred at the funeral, and while the troops looked on with indifference, the mob killed Fersen with sticks and stones in the great square of the Riddarhus in Stockholm. His sister escaped in disguise. It is now universally acknowledged that Fersen was guillotined.

Fesch, Joseph, cardinal, and archbishop of Lyons, born in Ajaccio, Corsica, Jan. 8, 1768, died in Rome, May 18, 1839. He was the son of a Swiss officer in the Genoese service, and half brother of Letizia Ramolino, the mother of Napoleon Bonaparte. He was archdeacon of the chapter of Ajaccio when the chapters were suppressed by the revolution of 1789. In 1798 he was exiled with the Bonapartes, and being without resources laid aside his priesthood and was appointed commissary of war to the army of Italy, of which subsequently his nephew
FESSENDEN

Napoleon received the command. He resumed his ecclesiastical functions while the first consol confirmed. He re-established in France the Catholic worship, and was active in the negotiations between Napoleon and Pius VII. which prepared for the concordat of July 15, 1801. The influence of his nephew made him archbishop of Lyons in 1802, and obtained a cardinal's hat for him in 1803. As ambassador of France at Rome in 1804, after conducting the negotiations, he accompanied Pius VII. on his way to Paris to crown the emperor. Many civil dignities and emoluments were subsequently conferred upon him, but in 1809 he declined the archbishopric of Paris, to which Napoleon, wishing to make some one of his family the head of the French clergy, nominated him. He was president of the council which sat in Paris in 1810, and also of the national council of 1811, called to consider the disagreement between Napoleon and the holy see concerning the nomination of bishops. In this capacity he did not satisfy the emperor, and for a time he disappeared from court; and he afterward adhered to the pope, greatly to the displeasure of his nephew. Upon the fall of Napoleon he retired to Rome, but was recalled to Paris during the hundred days. After the battle of Waterloo he lived in retirement in Rome. His collection of paintings, one of the largest ever brought together by a single person, was dispersed after his death.

FESSLER, Ignaz Aurelius, a Hungarian author, born in 1754, died in St. Petersburg, Dec. 15, 1839. He was a Capuchin friar, but was dismissed from that order and became professor of oriental languages and hermeneutics in Lemberg, where his tragedy of "Sidney" was performed in 1787. This being denounced as impious and revolutionary, he was obliged to flee, and repaired to Silesia. He embraced Protestantism, and in 1796 went to Berlin, where he joined Fichte in reforming a lodge of freemasons. In 1809 he became professor of oriental languages and philosophy at St. Petersburg, but soon lost this office on account of his alleged atheistic doctrines. Subsequently he was Protestant bishop of Saratov, and from 1833 till his death was general superintendent and ecclesiastical councilor of the Lutheran community of St. Petersburg. He was often involved in difficulties, especially as member of a Russian official committee at Sarpepta, where he was charged with wishing to convert the Moravian community of that city into a Protestant organization similar to that of the Jesuits. His principal work is "Geschichte der Ungarn und deren
Landasson (10 vols., Leipzig, 1812–25). He also wrote several historical novels, and works related to Oriental languages and philosophy, freemasonry, and literature, and an autobiography (Rückblick auf meine siebenjährige Pilgerfahrt, Breslau, 1826; 2d ed., 1861).

FESSLER, Joseph, an Austrian prelate, born at Lochau, Tyrol, Dec. 2, 1815. In 1887 he was ordained priest in Brixen, and devoted himself to teaching. He was professor of history and canon law for eleven years in the seminary of Brixen, and for four years in the university of Vienna, where he filled for four years more the newly established chair on the "Decretals." In 1861 the pope summoned him to Rome, and employed him in managing the affairs of the eastern churches, appointing him also consultant of the Propaganda on oriental rites. The bishop of Brixen at the same time named him his vicar general. Pius IX. nominated him, April 7, 1862, bishop of Nyessa in Mesopotamia; and on March 27, 1865, he was made bishop of St. Polten in Lower Austria. His long studies and labors on patrology, church history, and canon law, as well as in all that relates to the holding of diocesan, provincial, and general councils, caused the pope to designate him in 1889 as secretary of the council of the Vatican.

FEITH ALL, Fathah All, Fethah All, or Fath Al, shah of Persia, called before his accession Bab Khan, born about 1762, died in 1834. In 1797 he succeeded his uncle, Agra Mohammed, founder of the Kadjar dynasty, after having put down several claimants to the throne. In 1799 Col. Malcolm was sent by the governor-general of India on a mission to Feth Ali, and concluded a treaty by which the latter was to attack Khorasan and Afghanistan, and receive subsidies from England for that purpose. In 1809 a war broke out between Persia and Russia for the possession of Georgia, whose ruler had transferred his allegiance from the former to the latter power. In 1805 Napoleon offered Feth Ali his alliance and protection in the prosecution of the war, and in 1807 sent Gen. Gardanne as ambassador to Persia. The treaty of Tilasit having, however, put an end to hostilities between France and Russia, the Persian king abandoned the French alliance for that of the English; but he was obliged in 1813 by the successes of the Russians to yield Georgia to the czar by treaty. In 1821 a war broke out between Persia and the Ottoman empire on account of the extortions and oppressions practised by Turkish functionaries upon Persian pilgrims, and was terminated in 1823 by a treaty favorable to Persia. In 1826 Feth Ali, thinking to profit by the death of the czar Alexander, and to reconquer Georgia, declared war against the Russians; but his army, commanded by his favorite son Abbas Mirza, was vanquished by Gen. Paskevitch, and he was forced in 1828 to abandon Persian Armenia to Russia, and to make the Aras the boundary of his dominions. He amused himself in his leisure with writing verses, and left a collection of odes and songs. He had 800 females in his harem, and in 1826 is said to have had 81 sons and 58 daughters. He was succeeded by his grandson Mohammed, the son of Abbas Mirza, who died shortly before his father.

FEITAILES, or Fectailes, in ancient Rome, a college of priests, consisting of 20 members belonging to the noblest families, who held office for life, with power to fill vacancies in their number, and whose duty it was to carry the complaints and grievances of the Roman people before the magistrates and rulers of offending cities and tribes, to ask redress, to declare in case of refusal whether there was sufficient reason for hostilities, to perform the religious rites of warning the enemy, of declaration of war, and of ratification of peace, and to watch over the strict observance of treaties. This institution is believed to have existed among the people of Etruria. Its introduction at Rome is attributed by some to Numa, by others to Ancus Marcus. When the policy of Rome became that of continual conquest, the institution lost its influence, preserving only its religious character. The etymology of the term is uncertain. It has been variously derived from the Latin words fides, fides, ferox, and facio, and the Greek φίλας.

FEITICISM, Fetichism, or Fetishism (Port. feitiço, magic; perhaps connected with the Lat. fæctum, a bewitching), the religious worship of material things (fetiches) as the abodes of spirits. It is the lowest of the forms of worship found among uncivilized tribes, and exists especially among the negroes in Africa. There are two kinds of fetiches, natural and artificial. Among the former are celebrated rocks, particularly high mountain peaks where the lightning is supposed to dwell; single trees, and more frequently whole forests; many animals, as serpents, one of which has its own temple, where the snakes are kept by priestesses; snails, crocodiles (with the Ashantes), goats, sheep, &c. Usefulness and hurtfulness seem to have often dictated their selection, but not always. Artificial fetiches are either public, preserved by priests, or private, purchasable from them usually at a very high price. Kings and princes have large collections of fetiches, and every family has at least one. They are hereditary, and either hung up in the dwellings or worn on the neck or elsewhere, and even fastened on domestic animals. Occasionally they are made in rude imitation of the human form, and the public fetiches are sometimes of gold and very large. The worshippers provide their fetiches liberally with food, but if their prayers are not granted they frequently throw them away, or beat them to pieces. They have also festivals and sacrifices. For the latter the victims are oxen, swine, and other animals; but sometimes criminals, prisoners, or persons of the lowest classes of the tribe are immolated. The festivals are generally attended by excess in drinking, thefts,
FÉTIS, François Joseph, a Belgian composer and writer on music, born in Mons, March 25, 1784, died in Brussels, March 27, 1871. His father was an organist, and at the age of ten he was engaged as organist in his native town. Subsequently, after taking lessons from the most eminent teachers in Paris, he travelled in Germany and Italy, and made himself familiar with the works of the great masters of those countries. He returned to Paris in 1806, married a rich woman, and devoted himself to the study of the history of music, especially of that of the middle ages. In 1818, a reverse of fortune obliging him to return to the practice of his profession, he became organist and teacher of music at Douai, and in 1818 was appointed professor in the conservatory of Paris, and soon after published his Traité du contrepoint et de la fugue. In 1837 he founded the first journal devoted to musical criticism that had appeared in France, the Revue musicale, which he edited till 1855. At the same time he was pursuing his researches upon the theory of harmony, writing articles for various periodicals, and volumes upon the history and curiosities of music, and composing operas and pieces of sacred music. In 1828 he began his historical concerts, which have since found imitators in Germany and England. In 1835 the king of Belgium appointed him chapel master and director of the royal conservatory of Brussels. In 1834 he superintended the production of Meyerbeer's opera L'Africaine, in accordance with a direction in the will of the composer. His own most successful opera was La vieille, which was performed for 100 nights. As a writer on musical history he is unrivalled, and his works on almost every topic connected with music are numerous. His principal writings are: Biographie universelle des musiciens, et bibliographie générale de la musique, preceded by an epitome of the history of music (2 vols., Brussels, 1835-'44); Traité complet de la théorie et de la pratique de l'harmonie, contenant la doctrine de la science et de l'art (Paris, 1833); and a sketch of Meyerbeer in the Revue contemporaine (Paris, 1869).—His son ÉDOUARD FRANÇOIS LOUIS, born at Bouvines, May 12, 1816, was appointed in 1838 conservator of the royal library of Brussels, and is the author of Les musiciens belges (2 vols., 1848), Les artistes belges à l'étranger (vols. i. and ii., 1858), &c.

FEUCHÈRES, Sophie de, baroness, mistress of the last prince of Condé (Louis Henri Joseph, duke de Bourbon), born in the Isle of Wight about 1795, died in England, Jan. 2, 1841. She was the daughter of a fisherman named Clarke, represented herself as the widow of a Mr. Dawes, and is believed to have been on the stage; but the accounts of her life are conflicting until about 1817, when she became the mistress of the prince of Condé. At his instigation she married in 1818 the baron Adolphe de Feuchères, who became a member of his household, when the prince settled upon her 72,000 francs per annum. In 1822 she was divorced from the baron. She exercised over Condé an almost unbounded influence. In 1824 he presented her with the domains of Boissey and St. Leu, and in 1825 with 1,000,000 francs, besides leaving her 2,000,000 by his will, dated Aug. 80, 1829. A year afterward (Aug. 37, 1830) the prince was found hanging in his room, under circumstances which fixed the suspicions of his relatives upon the baroness, and also upon Louis Philippe; for in order to ingratiate herself with the Orleans family she is said to have prevailed upon the prince to bequeath the bulk of his large fortune to his godson, the duke d'Amale, a disposition which just before his death he seemed inclined to revoke in favor of the count de Chambord. His relatives accused her of having murdered the prince, and insisted upon a judicial investigation; but nothing could be proved against her, and the prince's death was ascribed to suicide. (See Histoire compilée du procès relatif à la mort et au testament du duc de Bourbon, Paris, 1833.) She left her immense fortune to her niece, Mlle. Sophie Tanceron. The baron de Feuchères gave to the hospitals of Paris his whole share in the property of his former wife.

FEUDAL SYSTEM, the name given to the condition of society that prevailed in Europe during the middle ages. Its germ was probably Asiatic, and in Asia, though never so fully developed, it has outlasted the system established in Europe. It had the firmest existence in France, Germany, Aragon, a large part of Italy, England after the conquest, and Scotland, while other European countries were more or less influenced by it. The system grew up in Europe from the 6th to the 9th century, and was the consequence of the perpetual struggle of civilization against barbarism. Like all systems that have lived for any great length of time, it had a progressive formation. The struggle out of which it grew began with the fall of the imperial authority in so many parts of the Roman empire; and when feudalism had established itself, the way had been prepared for a far greater advance toward the establishment of civilization. In France, feudalism was brought into a rude but intelligible form in the 10th century, and "the feudal period" is held to synchronize with the ten generations during which the throne of that country was held by the elder branch of the Capet family, 987-1328. For some generations previous to the extinction of the Carolingian dynasty it had had a
rude existence, and many of its incidents are traceable in legislation to the reign of Charle-
magne, throughout the limits of whose vast
domains feudalism was later perfected in its
fullest continental development. "The regu-
lar machinery and systematic establishment of
feuds, in fact," says Hallam, "may be consid-
ered as almost confined to the dominions of
Charlemagne, and to those countries which
afterward derived from them." But it is not
until a much later time that we find "the feu-
dal period" clearly established. As the chief
object of the great monarchs of the Carlov-
ingian line was the establishment of a consoli-
dated empire, it can scarcely be held that they
deliberately sought to develop a system whose
very essence was the disintegration of every
country in which it existed. The imbecility
of the later kings of the second race favored
the advance of feudalism in France; and in
that country it was known earlier than any-
where else, and there it received its essential
peculiarities. At the time of the conquest of
Gaul, and the rise of the Merovingians, there
were many freeholds, that is, independent
properties; but in the course of the five fol-
lowing centuries most of these had disappeared.
The beneficiary condition became the common
condition of territorial property. Benefices and
fief are words that express the same facts at
different dates. In the middle of the 12th
century feodum and beneficium were used in-
terchangeably, as they had been used for some
time previously to that date. The exact nature
of benefices has been the source of consider-
able dispute, but the better opinion is that
their ordinary duration was the life of the pos-
sessor, after which they reverted to the fisc;
yet there were instances of hereditary benefices
as early as the Merovingian times. The ten-
dency to retain property in their families would
lead men to make use of a variety of means to
render what they held hereditary, while the
weakness of the kings would not enable them
to resist claims powerfully urged in behalf of the
sons of beneficiaries. Under the feudal system
the territorial element was known as the fief,
and it has been argued that this did not mean
originally the land itself, but only the tenure
thereof, its relation of dependence toward the
suzerain; but the weight of authority is ad-
verse to this view, though it is admitted that
at a later period some such distinction may
have been made. The titles, or most of them,
which became so identified with feudalism,
were not originally hereditary, but were made
so gradually, like the property possessions which
rendered the great vassals so powerful. Dukes,
counts, and marquises, or margraves, were at
first provincial governors, officers intrusted
with certain specific duties, the margraves be-
ing charged with the custody of the frontiers.
The weakness of the Merovingian kings made
these officers very important persons in the
state. The Carlovingsians sought to lessen their
power, and with some success so long as that
race produced able kings; but under Charle-
magne's successors the counts rapidly acquired
influence and wealth, and political station. The
same may be the law in regard to the Spanish
dukes, in all of which he endeavored to acquire
landed property, and to assume a right to his
dignities. In the last quarter of the 9th cen-
tury the succession of a son to a father's county
was a recognized usage; and "in the next cen-
tury," says Hallam, "there followed an entire
prostration of the royal authority, and the
counts usurped their governments as little sov-
ereignties, with the domains and all regalian
rights, subject only to the feudal superiority
of the king. They now added the name of the
county to their own, and their wives took the
appellation of countess. In Italy, the inde-
pendence of the dukes was still more complete;
and although Otho the Great and his descend-
ants kept a stricter rein over those of Ger-
many, yet we find the great fiefs of their empire,
throughout the 10th century, granted almost
invariably to the male and even female heirs
of the last possessor." Thus the hereditary
principle was recognized in a double respect—
as related to the possession of land, and as re-
lated to the possession of political power. The
counts became the enemies of the alodial pro-
priors, whose importance was derived from a
system entirely unlike that upon which their con-
sequence rested. The king and the law could
not protect the alodialists or independent pro-
priors from being spoiled by their enemies.
Many of them surrendered their lands, and re-
ceived them back upon feudal conditions;
or they acknowledged themselves vassals of a
suzerain. Yet the alodial lands were not en-
tirely extinguished. They were common in
the south of France, the strength of the feudal ten-
tures being between the Somme and the Loire.
According to the old French law, alodial lands
were always noble, like fiefs, down to 1580.
In the German empire many estates continued
to be held by alodial tenures. This part of the
subject is involved in considerable obscurity,
for in the royal charters of the 10th and 11th
centuries the word allodium is continually used
for a fief, or hereditary benefice. "Several
passages in ancient laws and instruments,"
says Hallam, "concur to prove that besides the
relation established between lord and vassal by
beneficiary grants, there was another species
more personal, and more closely resembling
that of patron and client in the Roman repub-
lic. This was usually called commendation,
and appears to have been founded on two very
general principles, both of which the distracted
state of society incultated. The weak needed
the protection of the powerful; and the gov-
ernment needed some security for public order.
Even before the invasion of the Franks, Salian,
a writer of the 6th century, mentions the cus-
tom of obtaining the protection of the great by
money, and blames their rapacity, though he
allows the natural reasonableness of the prac-
tice. The disadvantageous condition of the
less powerful freemen, which ended in the servitude of one part and in the feudal vassalage of another, led such as fortunately still preserved their alodial property to insure its defence by a stipulated payment of money. Such payments may be traced in extant charters, chiefly indeed of monasteries. In the case of private persons, it may be presumed that this voluntary contract was frequently changed by the stronger party into a perfect feudal dependence. From this, however, as I imagine, it probably differed, in being capable of dissolution at the inferior's pleasure, without incurring a forfeiture, as well as having no relation to land. Homage, however, seems to have been incident to commendation, as well as to vassalage. Military service was sometimes the condition of this engagement. It was the law of France, so late at least as the commencement of the third race of kings, that no man could take a part in private wars except in defence of his own lord. Indeed, there is reason to infer from the capitularies of Charles the Bald that every man was bound to attach himself to some lord, though it was the privilege of a freeman to choose his own superior. This is strongly supported by the analogy of our Anglo-Saxon laws, where it is frequently repeated that no man should continue without a lord. — By the edict of Milan, issued by Conrad II, emperor of Germany, in 1087, four regulations are established: 1. that no man should be deprived of his fief, whether held of the emperor or of a vassal lord, but by the laws of the empire and the judgment of his peers; that from such judgment an immediate vassal might appeal to his sovereign; that fiefs should be inherited by sons and their children, or on their failure by brothers, provided they were feuda paterna, such as had descended from the father; and that the lord should not alienate the fief of his vassal without his consent. This edict, though relating immediately only to Lombardy, is throughly marked by the maturity of the feudal system, and the last stage of its progress. Its object was to put an end to disagreements between inferior vassals and their immediate lords, which had been caused by the want of settled usage. Guizot is of opinion that the essential facts of the feudal system may be reduced to three, viz.: 1. the particular nature of territorial property, real, full, hereditary, and yet derived from a superior, imposing certain personal obligations on its possessor, under pain of forfeiture; in a word, wanting in that complete independence which is now its characteristic; 2. the amalgamation of sovereignty with property, the attribution to the proprietor of the soil, over all the inhabitants of that soil, of the whole or nearly the whole of those rights which constitute what we call a sovereignty; 3. the possession only by government, the public power; 8. the hierarchical system of legislative, judicial, and military institutions, which united the possessors of fiefs among themselves, and formed them into a general society. Of feudal relations, support and fidelity were the principal. The vassal owed service to his lord, and the lord protection to his vassal. If the vassal failed in his obligation, his land was forfeited; if the lord failed, he lost his seigniory. It is disputed whether the vassal was bound to follow his lord's standard against his own king. As respected the king, the relations were loose and shifting. There are instances of vassals aiding their immediate superiors against the king; and the royal power was always in antagonism to the feudal system. — The ceremonies which took place when a fief was conferred were principally homage, fealty, and investiture. The first expressed the submission and devotedness of the vassal toward his lord. The oath of fealty differed little in language from the act of homage, but was indispensable, was taken by ecclesiastics, but not by minors, and could be received by proxy. Investiture was the actual conveyance of feudal lands, and was proper or improper. By the first, the vassal was put in possession upon the ground, by the lord or his deputy, which the English law calls livery of seizin; by the second, possession was given symbolically, by the delivery of a branch, turf, or stone, or some other natural object, according to custom. Nearly a hundred varieties of investiture are mentioned. The vassal's duties commenced with his investiture. These were very numerous, and it is impossible to define them at large. They embraced nearly every obligation that can exist in such a state of society as that prevailed over most of Christendom. They varied, too, with place and time. Military service depended upon circumstances, though 40 days was the usual term that the tenant of a knight's fee was bound to be in the field at his own expense. Among the feudal incidents advantageous to the lord were relief, fines upon alienation, echeats, aid, wardship, and marriage, the two latter placing the vassal and orphan minors among his vassals almost entirely at his mercy. The control of female vassals with respect to marriage was carried to its utmost extent in the Latin kingdom of Jerusalem, founded by the first crusaders at the time when the feudal system was at its height. Improper fiefs, as they were called to distinguish them from the military fiefs, were in time granted, in order to gratify pride or to raise money. "They were granted for a price, and without reference to military service. The language of the feudal law was applied by a kind of metaphor to almost every transfer of property. Hence, pensions of money and allowances of provisions, however remote from right notions of a fief, were sometimes granted under that name; and even where land was the subject of the donation, its conditions were often lucrative, often the lord fief, and ... in ... ludicrous." Fiefs of office, too, were granted, by which persons received grants of land on condition of performing some domestic service to the lord. The mechanic arts were carried
on in the houses of the great by persons receiving lands upon these conditions.—The feudal system was exclusive in its spirit. In strictness, a person not noble by birth could not possess a fief, though there were occasional exceptions to this rule, which increased as the aristocratical spirit declined. Three descents were necessary to remove fully the stain of ignoble blood. Children born of an ignoble mother, in lawful wedlock, were looked upon as of illegitimate origin. The higher clergy, as prelates and abbots, were feudal nobles. Ecclesiastical tenants came within the scope of feudal duty. Below the gentle classes were the freemen and the serfs. The former were dwellers in chartered towns, and were destined to have an important part in destroying the feudal system; and in England, the yeomanry, to whose existence that country owed its leading place in the military system of Europe, were also among the freemen. The serfs, or villeins, were among the most abject of mankind, and were despised and maltreated because they had been degraded and injured. In some countries a distinction was made between villeins and serfs, the latter being compelled to perform the vilest labors, and thoroughly enslaved, while the condition of the former was not so harsh, their payments and duties being defined. Probably at no time in the world's history have the mass of the people been so badly treated as during the existence of the feudal system; and many of those customs and opinions that still impede the growth of the people in knowledge and happiness in several countries, are but relics of that system, and yet continue to do its work.—There were several causes for the decline of feudalism. The two extremes of society were alike interested in its destruction, and consequently sought it: the king, feebly grasping a sceptre that was scarcely more than a fool's bawble; and the squallid people, who were treated by the ruling classes with less consideration than they bestowed upon beasts of chase. The growth of the institution of chivalry, which was one of the children of feudalism, was injurious to the system whence it sprung. The feudal system had much to do with the crusades, and it was probably the only state of society in which those expeditions could either have been undertaken, or have been renewed from time to time during nearly 200 years; yet they worked most injuriously to it, and helped to prepare the way for its fall. The growth of the towns, the increase of commerce, the development of the commercial spirit, the acquisition of military knowledge by the people in several countries, scientific inventions and discoveries, and the application of gunpowder to the uses of war, aided its downfall. In France it failed under the pressure of the anti-feudal revolution of the 14th century, which rapidly accelerated its fate. It might have remained powerful during the first century of the Valois kings had it not proved totally unequal to the business it claimed as peculiarly its own, that of defending the soil its members owned, and the country they governed.—See Sismondi, Histoire des francais et Histoire des républiques italiennes; Guizot, Histoire générale de la civilisation en France et Histoire générale de la civilisation en Europe; Michelet, Histoire de France; Hallam, "Éurope during the Middle Ages;" Bell, "Historical Studies of Feudalism" (London, 1852); and Lacroix, "Manners, Customs, and Dress during the Middle Ages, and during the Renaissance Period" (translated from the French, London, 1874).

FEUERBACH. I. Paul Johann Anselm, a German jurist, born in Jena, Nov. 14, 1776, died in Frankfort, May 29, 1833. He studied law at Jena, and became professor of feudal law there in 1801, of criminal and civil law at Kiel in 1802, and at Landshut in 1804. In 1805 he was appointed to prepare a civil code for Bavaria, in 1808 became privy councillor, in 1814 a judge at Bamberg, and in 1817 president of the court of appeals at Ansbach. While he undertook to investigate the estate of Kaspar Hauser, without much regard to the sovereign families thought to be compromised in the matter. He was the author of many standard law books. Of these, the Lehrbuch des gemeinen in Deutsch-}
other hand, that being in which nature becomes conscious of itself, is man. . . . True, it follows from my theory that there is no God, that is to say, no abstract being, distinct from nature and man, which determines the destinies of the universe and mankind at its discretion; but this negation is only a consequence of the cognition of God's identity with the essence of nature and man."

FEUILLANTS, a branch of the order of Cistercians, founded in France in 1577 by Jean de la Barrière, abbot of the monastery of Feuillant, in the diocese of Rieux, Languedoc, for the stricter observance of the rules of St. Benedict, and declared independent by Sixtus V. in 1586. It received originally a very severe discipline, its members being obliged to go with naked head and feet, to sleep upon planks, and to eat on their knees. The rules were subsequently greatly relaxed, and the order spread over France and Italy. It was distinguished by the part which its members, especially the preacher Bernard de Montfauld, called La petit Feuillant, took in the civil wars of France in the time of the league. After having been the centre of numerous agitations, the Feuillants of France were in 1680 separated from those of Italy. Their costume was a white robe without a cap, and a white cowl. De la Barrière founded at the same time a female order of Feuillantes, whose convent was first near Toulouse, and afterward, by invitation of Anne of Austria, in Paris. The severe discipline to which the members of this order at first subjected themselves caused the death of many of them, and was reprimanded by the pope. The order lasted till 1790.—In the French revolution a club founded by Lafayette, Sieyès, and others, at first called the company of 1789, and opposed to the Jacobins, was known as the Feuillants, from their meeting in a convent of the abolished order. In March, 1791, it was broken up by a mob.

FEUILLET, Octave, a French novelist and dramatist, born in St. Lô, La Manche, Aug. 11, 1819. He was educated in Paris in the college of Louis-le-Grand, and in 1846 he wrote, under the pseudonym of Désiré Hazard, in conjunction with Paul Bocage and Albert Aubert, a romance entitled Le grand vieillard, published in the National. Since then he has written a large number of romances, comedies, dramas, and farces, nearly all of which have been received favorably. In 1862 he succeeded Scribe as a member of the French academy. He was afterward appointed librarian of the imperial residences, which position he held until the revolution of Sept. 4, 1870. Among his novels are: Polichinelle (1844); Osiris (1848); Bébésont (1849); Belles (1850); Le bal tarare, from le roman de Contes (1858); Le roman d'un jeune homme pauvre (1858), which has been translated into many languages; l'histoire de Sibylle (1862), scarcely less popular than the preceding; and Monsieur de Camors (1867), a story remarkable for invention and vigor, but regarded as exceedingly moralizing in its tendencies. His plays include La nuit terrible (1846), Le bourgeois de Rome (1846), La crise (1846), Le pour et le contre (1849), Daill (1857), Montjoye (1858), La belle au bois dormant (1865), Le cas de conscience (1867), Julius (1869), and Le Sphinx (1874), the last the most sensational of them all. He has written also, jointly with Paul Bocage, a number of other dramas, and has published several poems.

FÉVAL, Paul Hervé Caron, a French novelist, born at Rennes, Nov. 28, 1817. He belongs to an old legitimist family, studied law, but became a banker's clerk, and then a writer. His Mystères de Londres (11 vols., 1844), somewhat in the vein of Sue and Soulié, passed through many editions, and has been translated into foreign languages. He has since published some 300 volumes, including Les amours de Paris (6 vols., 1845); La fille du diable (12 vols., 1846); Les rebelles de Paris (8 vols., 1850); Le beau (12 vols., 1858); and Les tribunaux secrets (8 vols., 1864). English translations of some of his novels appeared in 1870.

FEVER (Lat. febris, probably a transposition for fæbris, from ferre, to bear, or hot), or Pyrexia (Gr. πυρέξια, from πυρος, to be feverish, derived from πυρ, fire), a morbid state characterized especially, as the names denote, by an increase of the temperature of the body, generally together with acceleration of the circulation, loss of appetite, thirst, muscular debility, mental weakness, lassitude, and derangement of the functions of most of the important organs of the body. The significance of the term fever has been enhanced of late by the use of the thermometer placed either in the armpit or within some one of the outlets of the body. The thermometer shows a morbid increase of the heat of the body in some cases when this is not apparent to the hand placed on the skin, and when the patient may have a sensation of coldness. During the so-called cold stage of an intermittent fever, the thermometer shows the heat of the body to be moderately raised. Fever may be said to exist whenever the heat of the body is raised above the maximum of health, namely, about 99° F. Fever is distinguished as symptomatic when it is dependent upon a local inflammation; and it is said to be idiopathic, or essential, whenever it cannot be attributed to any local cause. A symptomatic fever, as implied in the name, is only a symptom of disease; it does not constitute per se the disease; but an idiopathic or essential fever is reckoned as a disease. In the classification of diseases there are numerous fevers, which will be separately considered under the title FEVERS, excepting morbus meningitidis, and a few others, which are treated under their own names. In both symptomatic and idiopathic fever the increase of temperature affords not only evidence of the existence of the febrile state, but a criterion of its intensity. The fever
is intense in proportion to the increase of the heat of the body, as determined by the thermometer. The range of the morbifd fever rise is from 99° to 110°. Moreover, the temperature both in symptomatic fever and in the fevers is a criterion of the immediate danger to life. A temperature above 105°, if persisting, always denotes great gravity, and death is imminent if the temperature remains for any length of time above that point. The increase of heat is in part due to a morbid activity in the molecular changes incident to disintegration of tissue, but our existing knowledge does not enable the pathologist to give a full explanation of the rationale of fever. At present it is an unsettled pathological question to what extent the increase of heat is causative of the various morbifd phenomena which are presented in connection with symptomatic and essential fever. This question is important as bearing on the employment of drugs and other measures of treatment with a view to diminishing the heat of the body. There are certain remedies which from their effect upon temperature are called antipyretics; such are quinies in full doses, digitalis, veratum viride, &c. The most potent measure for diminishing temperature, however, is the employment of water externally, either in the form of the shower or plunge bath, the douche, the wet sheet, or by sponging the surface of the body. Drinking freely of cold water also has this effect. Antipyretic treatment has recently entered more largely into medical practice than formerly, from more attention having been given to the study of animal heat in different diseases by means of the thermometer.

FEVER BUSH (benoind odoriferum, Neeus), a shrub from 4 to 10 ft. high, with long, slender, and brittle branches, common in the northern swamy place in the deep shade of woods. Here it produces an abundance of flowers and fruit. The flowers appear in April or May in clusters from three to six in number, are of a greenshine yellow color, and come out where the last year's leaves were. The fruit is a small, oval, dark red or purple drupe, in bunches of two to five. The twigs or young branches are smooth and of a bright green, which assumes an olive tint the next year, and afterward a pearly gray. A decoction of the twigs is used to alleviate the itching from poisoning by enemas. According to Dr. Darlington, it is also used as a medicine for cattle in the spring. The berries have a pleasant, spicy taste, and have sometimes been used as allspice.

FEVERS, or Pyrexia, diseases characterized by a morbid increase of animal heat not referable to any local affection; that is, diseases in which the febrile state is idiopathic or essential. (See Fever.) A fever lasting but a single day in some cases, or continuing for a few days in other cases, is called simple fever or a febricula. It is without danger, as a rule, and calls for only palliative treatment. Exclusive of this form of fever, the different fevers are classified as follows: 1. Fevers characterized by periodical intermissions or marked remissions. This class is distinguished as periodical, or, from their causation, malarial fevers. Intermittent fever and remittent fever are embraced under these names, and yellow fever is generally included in this class. 2. Fevers which, in contrast with the foregoing, are characterized by a continuous febrile state, are called continued fevers. The fevers so classified are typhus and typhoid fever, relapsing fever, and erysipelatous fever. 3. Fevers in which an eruption on the skin is a prominent and a pretty constant feature are distinguished as eruptive fevers, namely, smallpox, chicken pox, scarlet fever, and measles.

To this list may be added the disease known as the plague. Other diseases which are essentially fevers are not always nosologically so classified. Examples of this kind are insolation or sunstroke, cerebro-spinal meningitis, influenza, and diphtheria. 1. Periodical Fevers.—1. Intermittent and Remittent Fevers. The periodical fevers of malarial origin manifest this remarkable peculiarity: Intermissions or remissions recur at regular intervals, following a law of periodicity. This is especially marked in intermittent fever, called also fever and ague, chills and fever, and various other names. This law of periodicity varies, giving rise to what are known as the different types of an intermittent fever. The regular or simple types are as follows: a, the quotidian type, in which a paroxysm of fever recurs on each successive day; b, the tertian type, in which the paroxysms recur on every other or every third day; c, the quartan type, in which two days elapse between the paroxysms, that is, in which they recur on the fourth day, dating from the commencement of one to the commencement of

---

Fever Bush (Benoind odoriferum).
FEVERS

the next paroxysm. Compound types, as they are termed, are the double quotidiam, two paroxysms occurring daily; the double tertian, a paroxysm occurring daily, the paroxysms differing in certain respects on two successive days, but corresponding on alternate days; a double quartan, in which a paroxysm occurs on two successive days, and on the third day there is no paroxysm. Extremely rare varieties of type are a quintan, sextan, heptan, and octan; these names expressing the length of the intervals. The facts thus exemplifying a law of periodicity are, with our existing knowledge, inexplicable. A paroxysm of an intermittent fever, when complete, consists of three periods or stages, called generally the cold, the hot, and the sweating stage. These different stages are of variable duration, the length of the paroxysm in different cases varying from three to eight hours. The cold stage is sometimes characterized by shacking, that is, muscular tremor or rigor, and sometimes only by a sense of chilliness. This stage is sometimes wanting. The intensity of the fever varies much in different cases in the hot stage, and so the amount and continuance of the sweating, which follows. If not arrested by remedies, intermittent fever tends to continue indefinitely, and is apt to induce notable anemia or impoverishment of the blood (see Chlorosis), and sometimes general dropy. Enlargement of the spleen is an occasional result of the disease. There are certain remedies which possess the power of arresting the paroxysms, and these remedies are therefore called antiperiodics. The drugs which especially have this power are the salts of quinia or quinine. (See Cinchona.) In the vast majority of the cases of intermittent fever, the disease is promptly cured by quinine, which, given judiciously, does no harm. This drug also has a prophylactic power; that is, it prevents the occurrence of intermittent fever, and protects against relapses. Other remedies which are efficacious, but in a less degree, are salicina, bebeferine, ferrocyanide of iron or Prussian blue, strychnin, and arsenic. Remittent fever is also often controlled by quinia and other periodics.—In general, intermittent and remittent fevers are not immediately dangerous to life, even if they be allowed to continue; but they are sometimes attended with great danger, and they may cause death within a few hours. In these cases the disease is distinguished as puerperal or remittent fever. In some portions of this country it is called congestive chill. Patients affected with this fatal form may fall quickly into unconsciousness (coma), from which they do not emerge; some cases are characterized by delirium, and sometimes vomiting and purging occur, followed by a state of complete inactivity, from which no recovery results. Puerperal intermittent or remittent fever is more apt to occur in tropical than in cold and temperate climates. Cases are more likely to occur at certain seasons than at others; and whenever their occurrence is observed, it is immensely important to arrest the disease in every instance as speedily as possible, lest succeeding paroxysms may prove to be puerperal. If a patient pass through one paroxysm in which the symptoms threatened danger, the treatment which succeeded in preventing another paroxysm may be the means of saving life. Quinine should be given promptly and boldly under such circumstances. The nature of the special cause of intermittent and remittent fever is unknown. Whether it be a chemical product or a living entity (animal or vegetable) is as yet a question which can only be met with reasoning and speculations. The cause is endemic in certain situations, and therefore it is of telluric origin. It is more likely to emanate from marshy situations than from those in which the soil is dry, and hence it has been called marsh miasm. It is contained in the lower strata of the atmosphere, and is present especially between sunset and sunrise. It is a very remarkable fact that the special cause may remain for a long time latent in the system; patients sometimes do not experience the disease until many months or even years after the morbid agent has entered the body. Persons who have had periodical fever are liable during many years to relapses, without any fresh exposure to the cause. Remittent fever has been called bilious remittent, or simply bilious fever; but there is no ground for referring the pathology of this fever especially to the liver, as these names would imply.—Periodical fever may be combined with continued fever, giving rise to a hybrid disease which of late years, in this country, has been called typho-malarial fever. The view generally held is that the special cause of periodical fever, as well as the special causes of all the essential fevers, produces its morbid manifestations by its presence and the changes which it occasions in the blood. The blood changes have been supposed to be analogous to those in fermentation, or those which are chemically called catalytic. The name zymotic (Gr. ϖυμος, leaven) is based on this hypothesis. The diseases which are supposed to involve fermentation or catalytic changes in the blood have been nosologically distinguished as zymotic diseases. Many cogent considerations render it probable that the special causes of different fevers are living germs or entities, but their existence has not as yet been satisfactorily demonstrated.—2. Yellow Fever. This, although included in the class of fevers called periodical, differs essentially from intermittent and remittent fever, and is a distinct species. It has doubtless its own special cause, that is, a cause peculiar to this fever. The disease prevails only in certain portions of the globe, and is rare in any but tropical or sub-tropical regions. As a rule, in these regions it is rarely prevalent in the colder months of the year. The yellow fever zone, as it is termed, is be-
The disease prevails more in the eastern than in the western hemisphere, and in certain parts of Europe and America more than in Africa. In the western world it occurs especially in the commercial towns on the Atlantic coast south of Charleston, on the gulf of Mexico, and in the West India islands. In some seasons it prevails either as an endemic or an epidemic, and is largely destructive of human life. The mortality varies much in different seasons, the variation ranging from 10 to 75 per cent. The question as to its contagiousness has been heretofore much mooted, but at the present time comparatively few physicians regard it as communicable. The special cause, however, may be transported by means of infected vessels and merchandise, and in this way the disease is liable to be imported. Hence the disinfection of vessels coming from ports where the disease prevails, together with certain quarantine restrictions, are important. The nature of the special cause of this, as of others of the essential fevers, is unknown, but the germ theory is perhaps the most consistent with known facts relating to the history of epidemics. Facts show that the prevalence of the disease in situations where it is indigenous, and also where it has been imported, is much promoted by auxiliary causes, such as overcrowding, defective drainage or sewerage, filth, and other circumstances affecting unfavorably public health. The special cause is destroyed by a temperature of 52° F. Irrespective of the killing effect of frost, epidemics appear to have a self-limited duration, averaging a little under 60 days. Acclimation protects against the disease, the natives of yellow fever localities, and those who have been long resident therein, being rarely attacked, although they have never experienced it; and this is one of the diseases which, as a rule, are experienced but once in a lifetime, being in this respect in striking contrast to intermittent and remittent fever. In places where the disease is indigenous, it is common for it to occur sporadically during the hot seasons; that is, cases occur, but not in a sufficient number to constitute an endemic; and when persons receive into the system the special cause in a place where the disease prevails, and going to another place experience in the latter the disease, as a rule it is not disseminated. These facts show that the special cause is not generated within the bodies of those affected.—Yellow fever generally is abrupt in its attack; that is, it is preceded by few or no premonitions as a rule. It commences with a chill, which is often not of marked intensity. The fever varies in its intensity in different cases, as denoted by the temperature, the pulse, and other symptoms. Pain in the loins and limbs is usually a prominent symptom. The fever continues for a period ranging in different cases from a few to many days, when either subsides or entirely ceases. In mild cases convalescence now ensues; and in a certain proportion of cases the disease is mild, and not always easily discriminated from an ephemeral fever or a febricula. In grave cases the symptoms which especially denote gravity occur after this paroxysm of fever. Among these symptoms is yellowness of the skin, or jaundice, whence the name yellow fever. This, however, does not occur in all cases, being absent in very mild attacks. It denotes a certain measure of gravity, but is by no means a fatal omen. A much graver symptom is the vomiting of blood, or, as it is called, the black vomit. Cases very rarely end favorably when this symptom occurs. Hemorrhage in other situations, namely, the bowels, bladder, nose, eyes, and wounds which may exist on the skin, is an event denoting danger in proportion to the loss of blood. Suppression of urine occurs in some cases; and convulsions with coma, which sometimes occur, are probably caused by the retention in the blood of the excrementitious principles of the urine. The mode of death is generally by exhaustion. The muscular strength in some instances is preserved in a remarkable degree, patients not taking to the bed and sometimes continuing their avocations until shortly before death. These have been called "walking cases." The duration of the disease in fatal cases ranges from three to nine days, the average being less than a week. —The treatment does not embrace any specially curative remedies. Quinia and mercury have been considered as exerting a controlling influence over the disease, but at the present time no one attributes such a power to these remedies. Complete rest is highly important. Opiates and other anodyne remedies are indicated if there be great restlessness. All purgative and debilitating medication is injurious. Diaphoretic remedies are considered useful. Alcoholic stimulants are to be given, if tolerated, in proportion as the symptoms denote exhaustion. There is reason to believe that lives are sometimes saved by the free use of wine or spirits. Remedies to palliate vomiting, and to avert hemorrhage if this occurs, enter into the treatment. II. CONTINUED FEVERS.

3. Typhus Fever. Of the fevers distinguished as continued, typhus and typhoid were formerly considered identical; but the researches of Louis and later observers have established their non-identity. They are distinct species of fever, and not merely different varieties of one disease. The name typhus (Gr. τύφω, torpor) has reference to the stupor which is a marked feature in the majority of the cases of the fever so called. It was applied to the disease in 1759 by Sauvages. In this country the disease has been known as ship fever from the fact that it is imported in emigrant vessels. It prevails especially in Ireland. It has also been called jail fever, camp fever, petechial fever, &c. It is a contagious disease, being communicable by incapable emanation from the bodies of those affected with it; that is, by an infectious miasm, the nature of which is
FEVERS

not known. The extent of its diffusion, or what is termed the infecting distance, is not great, and it is rarely that the contagion is transported by means of clothing or other substances to which it adheres; that is, by fomites. In general, it is necessary that the miasm be concentrated, as when the emanations from a number of patients accumulate in hospital wards, or when the room in which a single patient is treated is small and ill ventilated, for the disease to be communicable, excepting to those who may be brought into close and continued contact with cases. Among nurses and physicians in the fever wards of a hospital, a considerable proportion contract the disease. A single case in a hospital ward may communicate the disease to patients lying in close proximity. It is probable that the special cause is sometimes generated in the concentrated emanations from the bodies of healthy persons congregated in overcrowded and imperfectly ventilated apartments, as in jails, camps, almshouses, and crowded ships.—In typhus, as in other fevers, the intensity of the febrile condition is denoted especially by the temperature of the body, the range in different cases varying from 102° to 107°F. The temperature in the evening, as a rule, is somewhat higher than that of the morning; and approaching convalescence is often first denoted by a fall of temperature. The frequency of the pulse is also a good criterion of the severity of the disease. In most cases there is marked stupor throughout its course. The patient often lies in apparent somnolency, and when aroused the countenance has a stupid, besotted expression. The face has a dusky hue, from the retardation of the circulation through the capillary vessels. A low muttering delirium is frequent, patients often attempting to get out of bed from some transient delusion, but being easily induced for the moment to refrain from the attempt. Active delirium requiring forcible restraint is rare. The tongue is often covered with a thick brown or black coating, and, if not prevented by the removal of the accumulations on the teeth and lips, these become covered with a dark or black material called mordis. Tremor of the muscles of the extremities, called subcutis tendinis, occurs in severe cases. The bowels are usually constipated. Swelling and suppuration of the parotid glands occasionally occur. In the great majority of cases there is an erosion on the skin, the character of which serves to distinguish this fever. It appears generally on the third day after the patient takes to the bed. The distinctive characters are as follows: It is maculated, that is, consists of spots, not elevated above the surface of the skin, of a dark or dusky color, and not readily obliterated by pressure with the finger. They continue throughout the disease, and are perceptible after recovery. The margins of the spots are thickly studded with them, but in some cases they are few in number and limited to the trunk. This fever differs from the malarial fevers (intermittent and remittent) in being a self-limited disease. The length of its course varies between 8 and 20 days, the mean duration being about 14 days. The mortality varies considerably at different times and places, the range of variation being from 9 to 35 per cent.; the average mortality is as 1 to 5 or 6. The death rate differs according to the age of patients; it is least between 10 and 20 years, increases progressively after the age of 30, and the proportion of fatal cases is about one half after 50 years of age. A fatal termination is sometimes attributable to an important complication, as for example pneumonia; and it may be due to an antecedent disease, such as some affection of the kidneys. In general, the mode of dying is by exhaustion or ashenia.—4. Typhoid Fever. Although this has many symptoms in common with typhus, it differs in essential points. The name signifies resemblance to typhus. Owing to the existence of a characteristic affection of the intestines, it is called by German writers abdominal typhus, and by English and American writers, for the same reason, enteric fever. This characteristic intestinal affection is one of the essential points of distinction between typhoid and typhus fever. The affection is seated in the Peyerian and solitary glands of the small intestine. These glandular sacs become enlarged by morbid growth, softening ensues, and at length they exfoliate or slough away, leaving ulcera tions in the spaces they occupied. Perforation of the intestines is an accident which sometimes occurs, the contents of the intestinal canal escaping into the peritoneal cavity; peritonitis follows as a result, terminating almost always in death. Another occasional event is hæmorrhage from the ulcers. This is sometimes profuse, and may be the cause of a fatal termination; but in the majority of the cases in which this accident occurs recovery takes place. The mesenteric glands which are in immediate relation to the Peyerian and solitary glands become considerably enlarged. If recovery from this fever takes place, the enlargement of these glands gradually disappears, and the intestinal ulcerations become cicatrized. The spleen is also constantly more or less enlarged and softened in typhoid fever. These morbid changes constitute what are called the anatomical characteristics of this disease; they are wanting in typhus fever. Typhoid fever is undoubtedly communicable; yet it is rarely communicated to those who are brought into contact with cases of it, namely, physicians, nurses, and fellow patients in hospital wards; and it occurs when it is quite impossible to attribute it to a contagium. Hence, this is a disease which, although produced in a certain proportion of cases irrespective of either a virus or an infectious miasm, may yet generate either one or both of these contagious material. Facts go to show strongly that the contagium is contained in the intestinal
evacuations, and that the disease may be diffused by means of drinking water into which excrement in ever so small quantities has found access. Outbreaks of this fever have been repeatedly traced to defective waste pipes and obstructed drains or sewers. The fever is not restricted in its prevalence to any particular sections, but it is indigenous in every quarter of the globe. All ages are not alike liable to it. It is rare in infancy, but not very frequent in childhood, and occurs very rarely after the age of 50 years. It is more apt to prevail in the autumnal months than at other seasons. It was observed by Louis that in Paris persons who had resided there but a short time were more likely to be affected than native or older residents, and this has been observed in other cities.—In most cases typhoid fever is developed gradually. The average period from the first evidence of illness to the time of taking to the bed is about five days. The early symptoms are chilly sensations, pain in the head, loins, and limbs, listlessness, and looseness of the bowels. Bleeding from the nose is of frequent occurrence. During the course of the fever stupor, as in cases of typhus, is more or less marked. Low muttering delirium is common, and in severe cases suprutilus tendinitum. The symptoms which are especially distinctive, as contrasted with typhus fever, are those referable to the intestinal affection, namely, diarrheae, flatulent distention of the abdomen, tenderness in the iliac regions, and a sound of gurgling when pressure is made in these regions. These are known as the abdominal symptoms of typhoid fever. In the majority of cases there is a characteristic eruption, usually confined to the trunk, but sometimes extending to the limbs. The eruption, however, is rarely abundant, differing in this respect from that of typhus. It also differs in character, that of typhoid fever being papular (pimples, not spots); the color is red (hence called the rose papules); the redness disappears momentarily on pressure with the finger; the papules are not persistent, but come and go throughout the disease, and all appearance of the eruption disappears after death. The eruption appears later than in typhus, not being discoverable until about the seventh day from the time the patient takes to the bed. The duration of the fever is longer than that of typhus, the average, dating from the time of taking to the bed, being about 16 days in the cases which end in recovery; it is somewhat less in fatal cases. In some cases the duration is greatly protracted, and may extend to 60 days. Relapses sometimes occur, the patient during convalescence or shortly after recovery being again seized and passing through a second course of the fever. The second attack being called retyphus, is preceded by a decline in the temperature of the body (called defervescence); and frequently before a persistent reduction there are notable variations, as shown by the thermometer, between the morning and evening temperature. The average mortality is about the same as that from typhus, 1 to 5 or 6; the rate varies much, however, at different times and places. Generally death is attributable to accidents, such as perforation of the intestine and hemorrhage; to complications, as for example pneumonia; or to the existence of antecedent disease.—The general principles of treatment are the same in cases of typhus and typhoid fever. It is doubtful if the cause of these diseases be ever arrested, but they appear sometimes to end prematurely; abort, as it were, spontaneously. It may be said, at all events, that there are no known measures which can be relied upon for cutting short their course. The great object, therefore, is to aid in bringing them to a termination in recovery. The mineral acids have been found to diminish the rate of mortality. The use of cold water, by means of the bath, the wet pack, and sponging the surface, not only affords relief by the abstraction of heat, but clinical observation has shown that it conduces to recovery. Supporting the powers of life by a proper alimentation, and resorting to alcoholic stimulants when these powers begin to fail, constitute essential measures of treatment. Milk is preeminently the appropriate article of diet, and alcoholic stimulants are sometimes tolerated in very large quantities without any of the excaitant or intoxicating effects which they would produce in health. There is reason to believe that lives are sometimes saved by the very free use of alcoholic stimulants, but it is important always to be governed in their use by the indications afforded by the symptoms. Favorable hygienic conditions are important, such as free ventilation, a proper temperature, and cleanliness. The benefit of an abundance of pure air is illustrated by the success with which these fevers have been treated in tents. In addition to the general principles of treatment, particular symptoms and events claim, of course, appropriate therapeutic measures.—As already stated in the account of periodical fevers, the special cause of these (malaria) may act in conjunction with the special cause of typhoid fever, giving rise to a combination of the symptoms of both kinds of fever, the disease being then known as typho-malarial fever. In cases of this compound fever the indications for treatment relate to the twofold causation.

—5. Spotted Fever. This name was given to a fever which prevailed in New England, New York, and Pennsylvania from 1807 to 1815. It was considered at that time to be a form of typhus fever, and was called also typhus petechialis, typhus synopalis, and typhus praecox. The name has recently by some writers been applied to the disease generally known as cerebrospinal fever or spastic fever (see brain diseases of this), the opinion being held that the latter disease is the same as that to which the name was formerly given. The reason for the name is the
FEVERS

occurrence, during the progress of the disease, of dark or purple spots which are caused by small extravasations of blood in the skin. As these spots (petechiae) occur in only a certain proportion of cases, and are present in other affections, the name spotted fever is not appropriate. Differences of opinion as to the nature and proper treatment of the disease first mentioned gave rise to a violent controversy, in reference to which see the following publications: Miner and Tully's "Essays on Fever and other Subjects" (1829); Miner, "Typhus Syncopeps" (1825); North and Strong on "Spotted Fever," report of a committee of the Massachusetts medical society in its "Transactions," vol. ii.; Gallup on the "Epidemics of Vermont," and Hale on the "Spotted Fever in Gardiner."—6. Relapsing Fever. Another of the continued fevers, now known by this name, has prevailed at different times in England, Ireland, and Scotland, but is rare on the continent of Europe. It prevailed among the English and French troops in the Crimea during the war with Russia. In this country it never prevailed to any extent prior to the winter of 1869-70, during which and the following summer it existed as an epidemic in New York and other large cities. The disease was evidently imported by foreign immigrants. It is undoubtedly a contagious disease, but not highly so; considerable exposure seems to be required. The infecting distance is restricted to a limited area, and it is not certain that the contagion is transported by means of fomites. The prevalence of the disease is aided much by cooperating causes, namely, destitution, deprivation, and deficient alimentation. From the apparent influence of the latter, the disease has been called "famine fever" and "hunger pest." It is developed abruptly, and usually commences with a well pronounced chill, which is at once followed by more or less increase of the heat of the body, with frequency of the pulse, and the usual concomitants of the febrile state. Frequently the patient perspires freely soon after the commencement of the fever. In most cases the fever is intense, the thermometer in the armpit showing a temperature frequently from 108° to 109°, continuing with but little fluctuation until the paroxysm ends; that is, for a period varying, in the great majority of cases, from five to seven days. Exceptionally the duration of this paroxysm is as brief as two, or as long as twelve, days. The febrile state subsides abruptly at the end of the paroxysm, when the temperature, together with the pulse, sometimes falls below the standard of health, returning to this standard after a day or two. The patient remains free from fever for a period varying from two to twelve days; the average number about seven days. Then occurs another paroxysm of fever, the intensity of which is sometimes greater and sometimes less than that of the primary one. This relapsing paroxysm varies usually from three to five days, exceptionally lasting only a single day, or extending even to ten days. The relapse is occasionally wanting, and in rare cases a third, a fourth, or even a fifth relapse has been observed. During the paroxysm nausea and vomiting are apt to be more or less prominent as symptoms. Sometimes blood is vomited, and hence, among a variety of names, the disease has heretofore been called mild yellow fever. Jaundice occurs in a small proportion of cases. Pain in the joints and in the muscles of the loins and limbs is usually a marked feature of this fever. Delirium rarely occurs. There is no characteristic eruption. Important complications are of very unfrequent occurrence. The mortality from this disease is slight, varying in different collections of cases from 2 to 4 per cent. In the fatal cases the death is sometimes due to complications or antecedent diseases; but instances of sudden death from syncope have been repeatedly observed, and also from coma and convulsions following suppression of the urine. Persons who have experienced the disease are not exempt from subsequent attacks. The fever cannot be cut short by any known means. The first consideration in the treatment is the temperature. Relief is obtained by the direct abstraction of heat through baths, the wet pack or sponging, and by antipyretic remedies. The palliation of the muscular and arthritic pain is the next object of treatment, requiring the use of opiates. Further indications relate to the kidneys, if their action be deficient, and to alimentation. The dietetic management, especially when the patient has been insufficiently nourished, is highly important; and, as in the treatment of other fevers, milk should constitute the basis of the diet.—7. Epidemic Erysipelas. A fever called epidemic erysipelatous fever, or epidemic erysipes, and popularly known in some parts of the country by the name of black tongue, prevailed, especially in the New England and the middle, western, and southern states, from 1841 to 1846. Erysipelas often occurred during the course of the disease, but not in the majority of cases; it appeared in different situations, was more or less extensive, and was apt to lead to suppuration, gangrene, and sloughing. Inflammation of the throat (pharyngitis) was a very constant local affection. The disease was not unfrequently complicated with inflammation of serous membranes (pleuritis, peritonitis, and meningitis), and with pneumonia. Suppuration of the glands of the neck was not uncommon. The mortality was large, owing to the complications just named. Laryngitis and oedema of the glottis were other complications leading to a fatal result. Irrespective of the danger connected with the local affections, the disease was mild, running its course in five or six days. Bleeding and other so-called antiphlogistic measures of treatment appeared to be hurtful. Tonic and supporting measures
fulfilled better the therapeutic indications. It was observed that in places where the disease prevailed cases of purpura fever were also prevalent. It was the general opinion among physicians that the fever was communicable.—A fever accompanied by pharyngitis or inflammation of the throat prevailed in the winter and spring of 1857 in the western part of the state of New York, in the adjacent parts of Pennsylvania, and in Canada. Its usual duration was from three to six days, and it terminated uniformly in recovery. A similar fever prevailed in 1860 among the United States troops stationed at Hart's Island, in Long Island sound. It is probable that this fever has occurred at other times and places without having been described by medical writers. The disease as yet has no name. It differs from acute pharyngitis in that it is manifestly an essential fever; that is, the febrile state is not symptomatic of the local affection, but the latter is secondary to or a complication of the fever. It is analogous to the epidemic erysipelas, in the constancy of the pharyngeal affection. III. Eruptive Fevers.—8. Scarlet Fever, or Scarlatina. This is distinguished from other eruptive fevers by the fact of the eruption being an exanthem, an efflorescence, or a rash, these terms not being strictly applicable to vesicles and pustules. The disease sometimes commences with a chill, and in most cases vomiting is a primary symptom, especially in children. The fever which at once occurs is usually intense, the axillary temperature often rising to 105°, or even higher. The pulse in general is correspondingly frequent. The surface of the body often gives the touch a burning sensation. The rash appears in about 24 hours after the date of the invasion, and with very few exceptions breaks out first on the face and neck, being diffused over the body in the course of 24 hours. The color of the rash is scarlet, whence the name. The rash in some cases is equally diffused over the whole skin, giving rise to an appearance like that of a boiled lobster. In other cases it is limited to patches varying in number and size, with irregular or serrated margins. The skin is somewhat swollen, and the rash occasions a burning sensation, with in some cases intense itching. Very generally the eruption takes place in the throat, more or less redness being apparent here, simultaneously with or before the appearance of the rash on the skin. Generally with the redness there is more or less swelling of the tonsils. Some cases are characterized by severe inflammation of the throat, accompanied by either an ash-colored product or an exudation resembling that which takes place in diphtheria; and with this affection of the throat the glands of the neck are swollen and sometimes suppurate. When the throat affection is severe the disease has been called scarlatina anginosa. The inflammation in some rare cases extends from the throat into the middle ear, giving rise to perforation of the tympanum, with perhaps loss of the ossicles, and resulting in more or less impairment of the sense of hearing. The cutaneous eruption continues from four to six days. Then follows the stage of desquamation. The cuticle generally in this stage exfoliates, and is separated either in the form of branny scales, or in large flakes or patches. In some instances the cuticle of the hands is separated intact, and may be stripped off like a glove. The itching in this stage is sometimes extremely annoying. In favorable cases the duration of this stage may be reckoned to be five or six days, when convalescence is established. Frequently, however, this stage is much protracted. Aside from variations in respect of gravity and danger incident to the throat affection, scarlet fever differs greatly in the intensity of the fever and constitutional symptoms. The disease in a certain proportion of cases is extremely mild, the patient perhaps not being confined to the bed. In other cases it is extremely severe, and it may prove fatal within a few days or even hours. In no other disease are the two extremes more widely separated. Death sometimes takes place before the eruption appears. An affection of the kidneys, namely, inflammation of the membrane lining the uriniferous tubes (desquamative or tubal nephritis), is occasionally a concomitant, but oftener a sequel, of scarlet fever. This local affection may interfere with the excretory function of the kidneys so as to occasion retention of urinary principles in the blood, constituting the morbid condition called uremia; and this condition may prove serious, giving rise to coma and convulsions. Occurring as a sequel of scarlet fever, this affection of the kidneys leads to general dropy. From this the patient recovers, provided fatal effects of uremia do not take place. Scarlet fever is highly contagious, and it may be communicated by means of fomites. The infectious matter remains for a long time in garments, &c., preserving its power of producing the disease. The time which elapses from the reception of the infection before the manifestation of the disease, that is, the period of incubation, is short, sometimes not more than 24 hours, and rarely exceeding a week. As a rule the disease is experienced but once, but exceptions are not very rare. Children are much more susceptible to the special cause than adults. After 40 years of age the susceptibility generally lessens. Children under two years rarely contract the disease.—The treatment in mild cases of scarlet fever is very simple. Active medication is not indicated. It suffices to diminish the animal heat by sponging the body and giving cooling drinks, with such palliative remedies as particular symptoms may demand. Other hygienic precautions. In severe cases the use of the cold bath or the wet pack is highly beneficial, not merely as affording relief but diminishing danger. The value in this disease of the direct abstraction of heat by these means
has been very fully established by clinical experience. Inunction of the surface of the trunk and limbs with fat bacon or some oleaginous preparation alaerts the itching, which is often very distressing, and in the opinion of some the severity of the disease is thereby much lessened. As in other diseases, whenever the symptoms show failure of the vital powers, supporting measures of treatment (alcoholic stimulants and alimentation) are indicated. There are no known remedies which exert a specific control over this disease, more than over the continued and the other eruptive fevers. Care during convalescence in scarlet fever is considered as especially important with reference to the liability to the affection of the kidneys already referred to. This care relates particularly to exposure to cold; and a fact important to be borne in mind is, that this affection of the kidneys often follows mild as severe cases of scarlet fever. Belladonna has been supposed to afford protection against this disease after exposure to the infection. This is not certain. Complete protection can be secured only by avoiding the infection through contact or proximity to patients, and disinfecting everything which may convey it.—For the other eruptive fevers, see Chicken Pox, Smallpox, Measles, and Plague.

FEYDEAU, Ernest Aine, a French author, born in Paris, March 16, 1821, died there, Oct. 28, 1873. He published a volume of poetry in 1844, and acquired notoriety in 1866 by his unquestionable novel Feu. His subsequent works of a similar kind were not as popular; nor was he successful as a playwright. He was connected with various journals, and his miscellaneous writings include Histoire générale des usages funèbres et des sépultures des peuples anciens (3 vols., 1858); Le secret du bonheur, sketches of Algerian life (3 vols., 1864; English translation, 2 vols., 1867); and L’Alger en 1871 (Paris, 1872).

FEYJOO Y MONTENEGRO, Francisco Beato Jerónimo, a Spanish reformer, born probably at Cardamiro, Oct. 8, 1676, died in Oviedo, May 16, 1761. He was a Benedictine monk, and became professor of divinity at Oviedo, abbot, and eventually general of the Benedictine order. He resided the greater part of his life in the monastery at Oviedo, devoted to literary, philosophical, and scientific labors. He opposed the philosophical system then taught in Spain, maintaining Bacon’s principle of induction in the physical sciences, and ridiculing the prevailing fallacies in regard to astronomy and astrology. He published his dissertations under the title of Teatro crítico universal, ó discursos varios en todo género de materias, para descubrimiento de errores comunes (1738-42), and continued it under the title de las virtudes universales (1742-60). His works have gone through many editions, and selections from them were translated into French by D’Herrimly (Paris, 1745), and into English by John Brett (London, 1770-80).

FEZ (Ar. Faz). I. A province of Morocco, occupying the northern portion of the empire, bounded N. by the Mediterranean, E. by Algeria, and W. by the Atlantic. It is traversed in the east and south by branches of the Atlas mountains, but the western portions form a rich champaign country, productive in grain, chiefly wheat and barley, honey, tobacco, olives, and wine. The chief river is the Sebo, which, rising in the E. part of the province near the Atlas mountain, passes within 6 m. of the city of Fez, and enters the Atlantic at Mâmora, where it is navigable. The chief cities are Fez and Tangier, the principal commercial seats of the empire, Mequinez, Tetman, El-Araish, Sales, Rabat, and Kasr el-Kebir. The Spanish presidios of Centa, Albucemas, Señor de Velez, and Melilla are in this province, on the Mediterranean. Fez formed a part of Mauritania Tingitana under the Romans. Early in the 5th century the Vandals settled here, and remained until the conquest of N.W. Africa by the Arabs. It was subject successively to the eastern caliphs and the Omeyyades of Spain, and was afterward an independent kingdom till conquered and annexed to Morocco about 1548. II. A city, capital of the province, in lat. 34° 36’ N., lon. 5° 1’ W., about 85 m. from the Mediterranean, and 90 m. from the Atlantic; pop. estimated at 88,000, including 65,000 Moors and Arabs, 10,000 Berbers, 9,000 Jews, and 4,000 negroes. It is situated on the slope of a valley watered by a small affluent of the Sebo, which divides within the city into two branches, supplying the baths and fountains. The city, surrounded by dilapidated walls, is 4 m. in circuit, and is divided into the old and new towns, both, however, ancient, and both composed of narrow, dirty streets. The houses are of brick, with galleries and flat roofs. It is one of the three residences of the emperor, but the palace, although large, is not remarkable. In the 16th century this place was a famous seat of Arabic learning. It has yet a university called the house of science, colleges, and elementary schools. Formerly the city contained some hundreds of mosques, and is said still to have 100, of which the principal are El-Karubin and the mosque of Sultan Muley Edris, founder of the city (in the 9th century). The former has a covered court for women to walk in, and the latter, which contains the remains of the founder, is a sanctuary for criminals. From its abundance of mosques and relics Fez is a holy city to the western Arabs. It possesses 200 caravansaries, some hospitals, and manufactories of woollens, sashes, silk stuffs and girdles, the red woolen cap called fez (dried of a bright red color by means of a berry found in the vicinity), slippers, combs, buttons, embroiderers, saddlery, arms, &c. Of the fine leather known by the name of morocco, the red comes from Fez. Its artisans are very skilful in goldsmith’s work and jewelry. It is the depot of the inland trade, and collects for export guns,
spices, ostrich feathers, ivory, &c. Caravans set out from the city semi-annually, in March and October, across the desert for Timbuctoo. The chief purpose of the journey is in 180 days, of which only 84 are employed in actual travel.

**FEZZAN** (anc. Phazzania, and the land of the Garamantes), an inland country of N. Africa, supposed to extend from about lat. 26° to 31° N., and from lon. 15° to 18° E., but the boundaries are ill defined; pop. about 60,000. It lies south of the pashalic of Tripoli, to which it is tributary, and is bounded on all other sides by the Sahara. In consequence of the want of moisture, and the great heat, it is almost barren of vegetation. The soil consists of black shining sandstone, or the fine sand of the desert, gypser, and rock salt, with strata of dolomite and limestone. The valleys intersecting the low ranges of hills contain the cultivable land of the region. Its northern parts are traversed by two ridges of stony and sandy hills, which in some places attain an elevation of 1,900 ft. from their base. In the eastern district they are called El-Ha-ruj, but in the west take the name of the Ghabian and Soddah mountains. S. of the Soddah extends the salt-incrusted desert of Ben Afen. The table land of Moorrzook occupies the middle and southern parts of the country. The land lies in a hollow lower than the surrounding desert. The heat in summer is intense, rising sometimes to 186°F. In winter the cold is greater than might be anticipated from its latitude; in 1850 snow fell at Sokna, and ice as thick as a man's finger was found at Moorrzook. There are no rivers or brooks, rain seldom falls, thunder storms are rare, and the climate is very unhealthy for Europeans. Dates are the staple product; small quantities of maiz and barley are raised. Among the other productions are figs, pomegranates, watermelons, legumes, durra, and a little wheat. Of domestic animals, goats are the most numerous; camels, horses, and asses are reared. Of wild animals, there are the lion, leopard, hyena, jackal, buffalo, fox, and porcupine; among birds, vultures, falcons, and other birds of prey, with ostriches and bustards. Fezzan is exempt from flies, but ants, scorpions, and bugs abound. Planted on the high road of commerce between the coast of Africa and the interior, the inhabitants place their main reliance upon the caravan trade. From Cairo to Moorrzook the caravan takes about 40 days, from Tripoli to the same place about 25 days. Of manufactures, besides a little leather and articles in iron, the country is almost destitute. Fezzan is inhabited by two branches of the Berber race: the Tuariks, who occupy the northwest, and the Tibbous, who dwell in the southern part of the country. Their complexion is dark brown, and their persons are well formed. They speak a corrupt dialect of Arabic and Berber. Their writing is in the Moghrabin characters, but they have little idea of arithmetic, and reckon everything by dots in the sand, ten in a line. Their media of exchange are Spanish coin and grain. The country is ruled by a sultan, who resides at Moorzook. The chief sources of income are land revenue, Negro slavery, and merchandise. The only places exhibiting prosperity, according to Barth, are Moorzook and Sokna; the population of each is estimated at about 3,000.—L. Cornelius Balbus the younger, Roman proconsul of Africa, penetrated into Phazzania about 20 B. C. The remains of Roman civilization, in the shape of columns or mausoleums, are still found as far S. as 26° 26'. In the 7th century Fezzan fell under the dominion of the Arabs, who introduced Mohammedanism, to which religion the people are still fanatically attached. Since then Fezzan has generally been tributary to some Arab potentate. In 1811 the bey Muki usurped the throne and acknowledged allegiance to the pasha of Tripoli. Fezzan has been much visited by modern travellers, and is regarded as the starting point for the interior of Negroland. Denham and Clapperton, Oudney, Hornemann, Lyon, Ritchie, Barth, Richardson, and lastly Dr. Vogel, have all visited and described it.

**FIARD, Jean Baptiste**, abbé, a French ecclesiastic, born in Dijon, Nov. 28, 1786, died there, Sept. 30, 1818. He accounted for the perversities of human conduct by ascribing them to demoniac agency. It was his opinion that Voltaire and other philosophers of his time were merely demons, and he denounced them as such before an assembly of the clergy of France in 1775. The French revolution seemed to him a great diabolic triumph, and his opinion was confirmed by his own imprisonment for two years for persistence in the exercise of the priesthood. Among his writings are Lettres philosophiques sur la magie (Dijon, 1808), and La France trompée par les magiciens et démonélastes du 18ème siècle, fait démontré par des faits (Dijon, 1809).

**FIBRINE**, a nitrogenous organic substance, existing in a fluid form in the blood and lymph, and capable of spontaneous coagulation when withdrawn from the vessels of the living body. Vegetable fibrine, a substance analogous to it in composition, is found in the newly expressed juices of plants, particularly of the grape, when these are allowed to stand for some time, and the gelatinous substance that is deposited is washed free from the coloring matter associated with it. A similar substance exists also in wheat flour, being separated in the gluten. Fibrine is obtained from freshly drawn blood by taking up the ropy portions that adhere to a twig with which it is stirred, and thoroughly cleansing these of coloring and soluble matters by washing. It is a soft white substance, and becomes on drying yellowish, brittle. of its revenue are taxes on slaves yees have been made of the fibrine, albumen, and caseine derived from vegetables used for food—the albumen from the clarified juice of turnips, asparagus, &c., and the caseine from beans and peas; and the results prove a close
analogy of composition not only among themselves, but with the chief constituents of the blood, animal fibre and albumen. One of the analyses of animal fibrine by Berthel well be given for either of the other substances, or indeed for the caseine of milk, which is a similar substance. The following is one of many quoted by Liebig: carbon, 54.454; hydrogen, 7.069; nitrogen, 15.763; oxygen, sulphur, phosphorus, 22.715. Fibrine is exceedingly important as a ingredient of the blood, since it is due to its presence alone that the blood is capable of congealing in wounds or after the ligation of blood vessels, and thus arresting the hemorrhage which would otherwise continue to take place. Its proportion in the blood is rather over two parts per thousand, in the lymph about one part per thousand.

FICHTE. 1. Johann Gottlieb, a German philosopher, born at Rammenau in Lusatia, May 19, 1762, died in Berlin, Jan. 27, 1814. He was the son of a poor weaver, and owed his education to a wealthy nobleman, the baron of Mittitz. He studied theology at Jena, Leipzig, and Wittenberg, 1780–88, and for ten years obtained a precarious living as a private tutor. While at Königsberg in 1791 he became acquainted with Kant, of whom he had been one of the earliest and most enthusiastic admirers, and as an application of his philosophy wrote a pamphlet entitledKRITIK ALLE FREIREBMUNGEN, "Brief of all Revelations," which, published anonymously, was generally believed to have been written by Kant himself. In 1798, while residing in Switzerland, he published a work in two volumes "to rectify public opinion in regard to the French revolution." In 1794 he obtained a professorship of philosophy at the university of Jena through the influence of Goethe, then secretary of state of Saxe-Weimar. Here he commenced a series of lectures on the science of knowledge (Wissenschaftstheorie), and gave also a course of Sunday lectures on the literary calling. In the same year he published a treatise containing the fundamental doctrines of his philosophical system, "Begriff der Wissenschaftstheorie, and during the next five years his system was matured and completed. By it he immediately took rank among the most original of living philosophers, and as it appeared to furnish a metaphysical basis for progressive political and religious views, he was considered one of the leaders of the liberal party in Germany. In conjunction with Niethammer he also published a philosophical journal, in which were inserted articles containing certain views which were considered by many as tending directly to atheism. The grand-ducal government, alarmed at the boldness of his theories, insisted on his removal, and Goethe, though he sympathized with him, felt bound to express his official disapprobation. Fichte resigned his professorship and appealed to the public in a pamphlet entitled "Appellation gegen die Anklage des Atheismus," which, though proving his deep earnestness, could scarcely be considered a conclusive refutation of the objections raised against his doctrines. He maintained in it that science could conceive the idea of existence only in regard to such beings or things as belonged to the province of sensual perception, and that therefore it could not be applied to God. God was not an individual being, but merely a manifestation of supreme laws, the logical order of events, the ordo ordinans of the universe. He said it was no less ridiculous to ask a philosopher if his doctrines were atheistic than to ask a mathematician whether a triangle was green or red. From Jena Fichte went to Berlin, where by his writings and lectures he exerted a great influence on public opinion, and after the reverses which befell the Prussian monarchy (1806) became one of the most conspicuous and powerful anti-Napoleonic agitators. For a few months only (1806) he accepted a professorship at the university of Erlangen, where he delivered his celebrated lectures UBER DAS WISSEN DER GEBRATEN. While the French conquerors were still in Berlin he delivered in the academy his Redem an die deutsche Nation, which are admired as a monument of the most intense patriotism and depth of thought. Immediately after the establishment of the Berlin university in 1810, he accepted a professorship there. In 1818 he resumed his political activity with great success. When at last the deliverance of Germany from French oppression had given him sufficient tranquillity of mind to resume the completion of his philosophical system, he fell a victim to the noble exertions of his wife in the cause of charity. By nursing the sick and wounded in the military hospitals for five months she had become infected with typhus. She recovered, but her husband, who had also taken the disease, succumbed to it. Besides the above mentioned publications, the following are Fichte's principal works: Grundlage der gesammten Wissenschaftstheorie (1794); Grundlage des Naturrechts (1798–9); System der Stilttenlehre (1798); UBER DAS WISSEN DER GEBRATEN (1801); Anleitung zum seligen Leben (1806). His complete works were published at Berlin in 1846. To give a succinct and intelligible analysis of Fichte's philosophical system is next to impossible. His language is abstruse and liable to misconstruction, to which indeed Fichte's philosophy has been subject in a higher degree perhaps than that of any other modern philosopher. Thus, for instance, to designate the self-conscious intellect as contrasted with the non-conscious objects of its conception, he uses the personal pronoun "I" as contrasted to the "not I" (Ich and Nicht-Ich, in English versions generally rendered by "I" and "not I"); and this was misconstrued by many of his contemporaries as a deification of his own individual self, while in point of fact he meant only that which by other moderns has been called
the absolute, and by the ancient philosophers the substance of man. Fichte's philosophy was intended to amplify that of Kant. Kant, in investigating the theory of human cognition, had arrived at the conclusion that the properties of external objects, by which they are discerned and known, are not realities, transferred from without into the human mind, but mere forms of conception innate in the mind. Hence he argued that objects *per se*, or such as they really are, independent of human cognition, are utterly unknown to man. So far as man is concerned, they are only phenomena; that is to say, for man they exist only as they appear to the mind according to its forms of conception (categories), while as *nomena*, or such as they are *per se*, they are unknown and inconceivable. What Fichte attempts to prove is simply this: that between objects as they appear to human conception and as they actually are there is no real difference, since the forms of human cognition are identical with the action of the absolute intellect; that objects are the limit set by the absolute within itself in order to arrive at perfect self-consciousness; that the absolute (the Ich) is at the same time subject and object, the ideal and the real. Reduced to plainer language, all this would mean that God (the absolute subject, the great active and creative "I") and nature (the "not I," the aggregate of objects) are united in a similar manner as soul and body; that the absolute intellect pervades all and everything, and that the human mind is an integral part of the absolute intellect. But, clothed in the most singular and obscure formulas, the theory of Fichte was understood by many to mean that all reality existed only in the imagination of man, and was in fact merely an outward reflection or manifestation of the workings of the human mind. Such was not his idea, and the term "idealism," when applied to Fichte, has a different meaning from that in which it is applied to Berkeley. That the ultimate consequences of Fichte's system would have led him into a sort of pantheistical mysticism is apparent from his later writings, in which the "I" is much more clearly than in his earlier works set forth as God, and all individual minds only as reflections of the absolute. Applying his metaphysical theories to ethics, Fichte concludes that morality consists in the harmony of man's thoughts (conscience) and actions. Entire freedom of action and self-determination is, according to Fichte, not merely the preliminary condition of morality, but morality itself. Hence law should be nothing more than a determination of the boundaries within which the free action of the individual must be confined; so as to concede the same freedom to others. Law has no meaning or existence without society. The object of society is the realization of the supreme law as conceived by human reason. The most perfect state of human society would be the true kingdom of heaven, since the absolute or God is revealed in the rational development of man.

It is easily seen how these ethical doctrines of Fichte appeared in practice. Maintaining that self-reliance and self-determination were the only guarantees of true morality, and contending against the assumption of the divine right of political institutions, he furnished a philosophical basis to the liberal political parties who opposed the sanctity of popular rights to the assumed divine right of monarchies. In order to inure to the people the greatest possible amount of rational well-being, Fichte taught that the introduction of the most universal popular education was one of the principal duties of the state. In regard to this subject his urgent appeals to the German governments were highly successful. The identity of the subject and object, or of the ideal and real, as taught by Fichte, became the basis as well of Schelling's nature-philosophy as of Hegel's absolute idealism, the former of which attempts a logical construction of the universe from the standpoint of the object (nature), while the other attempts the same from the point of view of the subject (the human mind). — The *Grundzüge des gegenwartigen Zeitalters* ("Characteristics of the Present Age"), *Wesen des Gelehrten* ("Nature of the Scholar"), *Bestimmung des Menschen* ("Vocation of Man"), *Bestimmung des Gelehrten* ("Vocation of the Scholar"), and some others of Fichte's works, have been translated into English by William Smith (with a memoir, London, 1845-8). Other translations from Fichte, by A. E. Kroeger, are, "New Exposition of the Science of Knowledge" (St. Louis, 1869), and "The Science of Knowledge" (Philadelphia, 1870). II. *Immanuel Kant*, son of the preceding, born at Königsberg, 1724. From 1755 to 1785 he filled the chair of logic and metaphysics at Göttingen, and since 1770 has been professor of philosophy at the university of Jena. He has published many philosophical works, mostly following the theories of his father, though he claims to have established a system of his own, which, in contradiction to the Hegelian pantheism, he calls concrete theism. Among his works are: *Säule zur Vorschriften der Theologie* (1826); *Die Ontologie* (1830); *Die speculative Theologie* (1848-7); *System der Ethik* (1850-58); *Anthropologie* (1806); and *Psychologie als Lehre vom bewussten Geiste des Menschen* (1884 et seq.). He has also published the literary correspondence of his father, with a biography (1830). He founded at Bonn the *Zeitschrift für Philosophie und speculative Theologie*, which he conducted from 1887 to 1848, and which has been continued by Ulrici and Wirth. **Fichtelgebirge** (Pine mountains), a chain of mountains in Bavaria, province of Upper Franconia, between the Bohemian Forest and the Franconian Jura, covered with forests of firs and pines. By reason of its position in the centre of Germany this chain is regarded as the nucleus of all the Germanic mountains,
though it does not surpass the neighboring chains in elevation. It separates the affluents of the North and Black seas, the river Naab descending from it on the north, the Inn on the north, the Eger on the east, and the Main on the west. It extends in length 80 m. N. E. from Baireuth to the Bohemian frontier, and its two loftiest summits are the Schneeberg (Snow mountain) and the Ochsenkopf (Ox Head), respectively 3,484 and 3,866 ft. high. The Fichtelgebirge possess a robust and laborious population. The upper part of the mountains yields oats and wood in abundance, and the lower parts produce rye, barley, flax, pulse, and a little wheat; but the chief industry of the inhabitants is in working the numerous mines of iron, vitriol, sulphur, lead, copper, and marble. The mountains are densely populated and traversed by good roads, and in the northwest by the Saxon-Bavarian railway.

FICINO, Marsilio, a Platonic philosopher of the 16th century, born in Florence, Oct. 10, 1433, died at Casaiggi, Oct. 1, 1499. He was the son of the first physician of Cosmo de' Medici, and was intended for his father's profession. The Greek Gemistus Pletho, an enthusiastic student of the philosophy of Plato, inspired Cosmo with the design of naturalizing this philosophy in Italy. He selected Ficino as a youth of great promise, to be instructed in the mysteries of Platonism, and to become the chief apostle or preceptor of a new Platonic academy. He educated him in his palace, surrounded him with Greek masters, encouraged him to read the philosophers of antiquity, placed him when 80 years old at the head of the academy of Florence, and charged him to be the interpreter and propagator of the Platonic philosophy in the West. Ficino made numerous translations from Plato, Iamblichus, Hermes Trismegistus, which were especially admired, and from most of the Alexandrian philosophers. He was appointed by Cosmo president of a literary society which assembled at his house, and had for its object to explain the doctrines of Plato. At the age of 40 he entered the church, and was appointed a canon in the cathedral of Florence. He became the disciple of all schools, and borrowed from all systems. He treated of the nature and immortality of the soul, the functions and distinguishing characters of angels, and the being and attributes of God. His chief merit, however, is as the translator and first western admirer of Plato; and in his partiality for this philosopher he is said to have endeavored to introduce fragments from his writings into the offices of the church. His works were collected and published at Basel (2 vols. folio, 1491).

FICK, Adolf, a German physiologist, born in Cassel in 1829. He received his diploma of M. D. at Zürich in 1852, and was professor of physiology there from 1856 till 1868, and has since filled the same chair at Würzburg. He has published Die medicinische Physik (Brunswick, 1867), as a supplementary volume to Müller's version of Pouillet's Éléments de physique. His other writings include Compendium der Physiologie des Menschen mit Einzeichnung der Entwickelungsgeschichte (1860), Anatomie und Physiologie (1869), and Die Naturkräfte in ihrer Wechselbeziehung (1869).

FICQUELMONTE, Karl Ludwig, count, an Austrian general and statesman, born at Dienne, Lorraine, March 23, 1777, died in Venice, April 7, 1857. He was a son of Count Joseph, who, after emigrating from Lorraine to Austria, died in 1799 from a wound received at the battle of Magnano. He entered the Austrian army, and in 1809 was colonel and chief of the staff of the grand duke Ferdinand of Este. In 1811 and 1812 he commanded three regiments of cavalry in Spain under Wellington. In 1818 he was promoted to the rank of major general, and in 1814 he brought about the capitulation of Lyons. He was afterward sent on several important diplomatic missions. He was minister of foreign affairs during Metternich's temporary absence from Vienna in 1889, and in 1840 became a member of the cabinet. During the revolution of 1848 he was for a short time minister of foreign affairs, and then provisional prime minister, till May 4, when he retired on account of a hostile demonstration of the people, who looked upon him as a disciple of Metternich; but he continued to exercise important influence in the affairs of the empire. He wrote several political pamphlets, some of which, as Lord Palmerston, England und der Continent (Vienna, 1852), and Zum künftigen Frieden (1856), attracted considerable attention. Les pensées et réflexions morales et politiques du comte de Ficquelmont appeared in Paris in 1859, with a biographical notice by M. de Barante.

FICION, in law, a composition which is known not to be true, but which is assumed to be true in order that certain conclusions and inferences may be supported. Fictions have been made use of in all legal systems, but in none more abundantly than in that of England. The important courts of queen's bench and exchequer acquired their general jurisdiction by means of the fiction of supposing in the one case a trespass and in the other a debt to the crown, which the defendant was not suffered to dispute. The old action of ejectment and the existing action of trover furnish cases of fictions which seem to us at this day utterly absurd, the supposed lease, entry, and ouster in the one case, and the supposed finding of the goods in dispute in the other, having no bearing on the merits of the case; but they nevertheless have had their use in enabling the courts to give suitable remedy for a wrong which otherwise might have gone unredressed in some cases. With few exceptions, no fictions are now retained in the law except such as have a beneficial purpose; and these are mostly fictions of relation, as where the title of an administrator is supposed to have attached at the death of the deceased, in order to enable him
to recover for any trespass or misuse of the property prior to his appointment; and that of a purchaser at a judicial sale is made to relate back to the time of sale, though the title is not to pass until after the expiration of a period allowed for redemption. Several rules are laid down in respect to fictions: 1. The law never adopts them except from necessity and to avoid a wrong. 2. They must not be of a thing impossible. 3. They are never admitted where the truth will work as well. 4. They are not admissible in criminal trials. The fiction, for instance, that the title of a purchaser at a judicial sale shall relate back and cover the period allowed for redemption, though admissible for the purpose of giving a remedy against a wrong doer, would not be admissible as against the party whose previous title was divested, if by law he was entitled to a beneficial use of the property until the time for redemption expired. Fictions might undoubtedly be all rendered unnecessary by statutory provisions, but not many are made use of in the law at this time which create any confusion, or the removal of which could be of any service beyond giving a little more directness to legal proceedings, or expressing the legal right in language more suited to the comprehension of laymen.

FIELD. I. David Dudley, an American clergyman, born at East Guilford, Conn., May 20, 1781, died at Stockbridge, Mass., April 15, 1867. He graduated at Yale college in 1802, was minister at Haddam, Conn., from 1804 to 1818, at Stockbridge, Mass., from 1819 to 1887, and again at Haddam from 1837 to 1851, when he returned to Stockbridge. He published "History of Berkshire County" (1839), "History of Middlesex County" (1839), "History of Pittsfield" (1844), "Genealogy of the Brainerd Family" (1857), and several occasional sermons. II. David Dudley, an American jurist, eldest son of the preceding, born at Haddam, Conn., Feb. 18, 1808. When he was 14 his father removed to Stockbridge, Mass., and in 1821 he entered Williams college. In 1826 he commenced the study of law, was admitted to practice in 1828, and settled in New York, where he has been conspicuous at the bar for more than 40 years. He is especially known by his labors in the cause of law reform. As early as 1839 he published his first essay on the subject, pointing out the necessity of a reconstruction of the modes of legal procedure. This he followed up by other articles on the same subject in 1842, 1844, 1846, and 1847. In 1847 he was appointed by the legislature of New York a commissioner on practice and pleadings, and as such took the leading part in the preparation of the code of procedure. Of this work only a part has been enacted into law, and many, if not all, the defects imputed to the code may be fairly attributed to this fact. The original design of the new system of civil procedure was to unite in one code a number of the forms of action and between legal and equitable suits, so that all the rights of the parties in relation to the subjects of litigation can be determined in one action, instead of dividing them as heretofore between different suits, often inconsistent and always perplexing. This system has been adopted not only in New York, but in Ohio, Kentucky, Missouri, Minnesota, California, Oregon, and in several other states, and has materially affected the legislation of Great Britain and her colonies. In 1857 Mr. Field was appointed by the legislature of New York as the head of a new commission to prepare a political code, a penal code, and a civil code, works designed to contain, with the codes of procedure, the whole body of the law. These several codes have been completed and reported, but have not as yet been adopted by that state. Other states have, however, drawn largely from them in their legislation, and in California they have been adopted entire, with only such changes and modifications as its constitution and conditions required. In 1866 he brought before the British association for the promotion of social science, at its meeting in Manchester, a proposal for a general revision and reform of the law of nations, similar to that which he had before undertaken in regard to the civil and criminal law. He procured the appointment of a committee consisting of eminent jurists of different countries, charged with preparing and reporting to the association the outlines of an international code, to be first submitted to their careful revision and amendment, and, when made as complete as possible, to be presented to the attention of the different governments, in the hope of receiving at some time their approval and adoption as the recognized law of nations. As the distinguished jurists composing this committee resided in different countries, it was difficult for them to act in concert, and each was left to act independently. Mr. Field, as the sole American representative, took the whole matter upon himself, and in 1873, after the lapse of seven years, presented to the social science congress his completed work, in a volume of nearly 700 pages, which he styles "Outline of an International Code." This work has attracted no little attention from European jurists. In the same year he attended a meeting held at Brussels, composed of delegates from all parts of Europe to consult upon this subject. This resulted in the formation of an association for the reform and codification of the laws of nations. The association consists of jurists, economists, legislators, and politicians, with branches in different countries. Its object is to substitute arbitration for war in the settlement of disputes between nations. Of this association Mr. Field was elected president. In August, 1873, he left the United States, proposing to make a tour around the world. III. Stephen Johnson, an American jurist, brother of the preceding, born at Haddam, Conn., Nov. 4, 1827. At an early age he went to the East, and passed nearly three
years at Smyrna and at Athens, engaged in the study of modern languages, particularly Greek. He returned in the winter of 1832-33, and in the following autumn entered Williams college, from which he graduated in 1837. He studied law in New York with his brother, and on admission to the bar became his partner, and thus continued until the spring of 1848, when he went abroad, and passed a year in Europe. On his return in the autumn of 1849 he went to California, where he has ever since resided. He was among the first settlers of what is now the city of Marysville, was elected its first alcalde, and held that office until the organization of the judiciary under the constitution of the state. Although the jurisdiction of the alcalde courts under the Mexican law was limited and inferior, yet in the then existing state of things in California unlimited jurisdiction, civil and criminal, was asserted and exercised by them. In October, 1850, he was elected to the legislature, and during the session of 1851 was an active member of that body. He introduced and succeeded in getting passed the several laws concerning the judiciary, and regulating the procedure, civil and criminal, in all the courts of the state. He was also the author of that provision of law which gave controlling form to the regulations and customs of miners in the determination of their respective claims, and in the settlement of controversies among them; a provision which solved a very perplexing problem, and has ever since remained undisturbed. In 1857 he was elected a judge of the supreme court of California for six years, from Jan. 1, 1858. A vacancy occurring previous to the commencement of his term, he was appointed to fill it, and took his seat on the bench Oct. 18, 1857. In September, 1859, he became chief justice of the state. The value of real property in California was placed on a solid basis while he was on the bench, and principally by decisions in which he delivered the opinions of the court. In March, 1863, he was appointed by President Lincoln an associate justice of the supreme court of the United States. As such he delivered the opinion of the court in the well known test oath cases. His dissenting opinions in the legal-tender cases, in the confiscation cases, and in the New Orleans slaughter house case, have also attracted attention. In 1873 he was appointed by the governor of California one of a commission to examine the code of laws of that state, and to prepare amendments to the same for legislative action.

Mr. Cyrus West, an American merchant, brother of the preceding, born at Stockbridge, Mass., Nov. 30, 1819. He was educated in his native town, at the age of 18 became a clerk in New York, and in a few years was at the head of a large and prosperous mercantile house. In 1853 he partially retired from business, and spent six months in travelling in South America. On his return he became deeply interested in the project of a telegraph across the ocean. He was first applied to for aid to complete a land line, which had been begun in Newfoundland, to cross the island, 400 miles, from Cape Ray to St. Johns, from where it was intended to run a line of fast steamers to the west coast of Ireland, and thus bring America within a week of Europe. While studying the subject, and turning over the globe in his library, the idea flashed upon his mind, "Why not carry the line across the ocean?" In this idea was the germ of one of the greatest enterprises of modern times, that of telegraphic communication between the old world and the new. His first step was to obtain legal authority. For this purpose he went in March, 1854, to St. John's, Newfoundland, and obtained from the legislature of that colony a charter, granting an exclusive right for 50 years to establish a telegraph from the continent of America to Newfoundland, and thence to Europe; and he thereupon associated with himself Peter Cooper, Moses Taylor, Marshall O. Roberts, Chandler White, and William G. Hunt, of New York, under the title of the "New York, Newfoundland, and London Telegraph Company," for the purpose of carrying this design into effect. Mr. Field thenceforth devoted himself almost exclusively to the execution of this project. To build the land line of telegraph across Newfoundland and Cape Breton island took more than two years. While this was in progress he went to England, and ordered a submarine cable, to connect Cape Ray and Cape Breton. This was sent out in 1855, but was lost in a gale in the attempt to lay it across the gulf of St. Lawrence. The attempt was renewed the following year with success. In that year (1856) he went to London, and there organized the "Atlantic Telegraph Company," to carry the line across the ocean. The law of real estate in England was in favor of the whole capital of the company. By his personal application he procured from the British and American governments aid in ships, and accompanied the expeditions which sailed from England in 1857 and 1858 for the purpose of laying the cable across the Atlantic ocean. Twice the attempt failed—in 1857, and the first time in 1858. The third attempt proved successful, and in August, 1858, telegraphic communication was established across the ocean. The cable, however, worked only a few weeks, and then became silent. To resuscitate the project now became more difficult than ever, as the public had lost faith. From that time it was kept alive only by the ardent faith and indomitable will of its projector. He was continually passing to and fro between America and Europe, inspiring fresh courage and gathering new resources. But obstacles multiplied, civil war broke out in the United States, and the nation, absorbed in its own affairs, had no time for foreign enterprises. Thus seven years passed away before the attempt was renewed. But at last, in 1865, another expedition was prepared. Submarine telegraphy had been greatly improved; a better cable was construct-
ed; and the Great Eastern took it on board, and sailed to the west. Over 1,200 miles had been laid, when by a sudden lurch of the ship, the cable snapped and was lost. The bottom of the sea was dragged for days in vain, and the expedition returned defeated to England. The year 1866 saw still another expedition, which this time proved successful. The cable, 2,000 miles long, was safely stretched across the ocean, and the communication proved perfect. After landing this the Great Eastern returned to the middle of the ocean in search of the cable lost the year before, and after a month’s labor finally succeeded in grappling it at a depth of two miles and bringing it to the surface, and, joining it to the cable on board, carried it safely to the western shore. Thus, after 12 years of incessant labor, in which he had crossed the ocean some 50 times, Mr. Field saw the great object of his life accomplished. Congress, at the unanimous request of Mr. Field, presented him with a gold medal, with the thanks of the nation; while the prime minister of England declared that it was only the fact that he was a citizen of another country that prevented his receiving high honors from the British government. John Bright pronounced him “the Columbus of modern times, who by his cable had moored the new world alongside the old.” The great exposition in Paris in 1867 gave him the grand medal, the highest prize it had to bestow. Since that year two other cables have been successfully laid, and telegraphic communication across the Atlantic ocean has never been interrupted for a single hour.

V. Henry Martyn, an American clergyman, brother of the preceding, born at Stockbridge, Mass., April 3, 1822. He graduated at Williams college at the age of 18, and after four years’ study of theology became pastor of a church in St. Louis in 1849. After five years he resigned his charge to go abroad. In 1847–8 he was in Europe, and after returning he published a historical sketch of the Italian revolutions, and a letter from Rome on “The Good and the Bad in the Roman Catholic Church.” In January, 1851, he was settled at West Springfield, Mass., whence he removed in 1854 to New York, to become one of the editors of the “Evangelist,” a religious journal, of which he subsequently became proprietor. In 1858 he again made a tour in Europe, which he described in a volume entitled “Summer Pictures from Copenhagen to Venice” (New York, 1859). In 1867 he went abroad again to the great exposition in Paris, and as a delegate to the Free church of Scotland and the Presbyterian church of Ireland. His last book is a “History of the Atlantic Telegraph.” He has also published “The Irish Confederates, a History of the Rebellion of 1798” (1851).

FIELD, John, a British composer, born in Dublin, July 26, 1782, died in Moscow, Jan. 11, 1857. His father was a violin player in the orchestra of the Dublin theatre. He received his first instructions upon the piano-

Fieldfare (Turdus pilaris).
is that of the thrushes, is orange at the base and brownish black at the end; the inside of the mouth is orange, the edges of the lides yellow, the iris brown, the feet and claws dusky; the head, hind neck, and rump are gray, most of the feathers on the first with a central dusky streak; a space before the eye brownish black, and a whitish line over the eye; the anterior half of the back and the wing coverlets are chestnut, shading behind into ash-gray; fore neck and breast yellowish red, with elongated triangular brownish black spots; the sides paler with broadly rounded spots; the lower breast and abdomen grayish white tinged with red; the wings are grayish black, with the edges of the feathers paler; tail deeper black, the lateral feathers grayish toward the end; the lower wing coverlets and axillary feathers are pure white, conspicuous during flight. The specific name is derived from a few hairy filaments on the occiput, which are also found in other species, and even in other genera. The female very closely resembles the male. The above is the plumage when it enters Great Britain from the continent; varieties in size and coloring are met with, and abinos are occasionally seen. They arrive in October and November, and some remain until the following spring if the season is mild; they roost in trees if they can, leaving for the fields at early dawn, in parties of three or four to many hundreds; their flight is easy but not rapid, and their movements in the trees and on the ground are graceful; they frequent open fields, associating often with other species, and are generally very shy. The food consists of hawthorn and other berries, worms, larvae, insects, seeds, and grains. They generally disappear in April or May, retiring probably in summer to the north to breed; the nests are built in society, usually in fir and spruce trees, and with the eggs, five or six in number, resemble those of the blackbird. The flesh is tender, fat, and of good flavor; this species varies in color. The species so highly esteemed by the Romans.

FIELDING, Copley van Dyke, an English painter in water colors, born about 1787, died in Worthing, Sussex, March 3, 1865. He belonged to a family of artists, and his first picture was exhibited in 1810. He early became a teacher, and acquired many pupils and friends. On the death of Joshua Cristall, he was elected president of the old society of painters in water colors, which office he held till his death. Fielding's favorite subjects were either rich wooded landscapes, or ships at sea off a stormy and rock-bound coast. From these two types he seldom varied. His manipulation was peculiar, but it represents atmospheric effects with great freshness. The demand for his works was so great that they were produced too rapidly, and fall into mannersism.

FIELDING, Henry, English novelist and dramatist, born at Sharpham Park, near Glastonbury, Somersetshire, April 22, 1707, died in Lisbon, Oct. 8, 1754. His father was a grandson of the earl of Desmond, and great-grandson of the first earl of Denbigh, and served under Marlborough, attaining the rank of lieutenant general at the close of the reign of George I. The family of the Fieldings is stated in the English peerages (where the name is spelled Fielding) to be descended from the same ancestry as the imperial house of Hapsburg. The early education of Fielding was intrusted to the care of the Rev. Mr. Oliver, a private teacher in Gen. Fielding's family, and who, it is said, appears in "Joseph Andrews" as Parson Trulliber. He received but little benefit from his tutor, and was sent at an early age to Eton, where he distinguished himself by his brilliant parts, and before his 18th year had made great progress in classical learning. From Eton he was sent to the university of Leyden, where he applied with assiduity to his studies, but led so gay a life that his father, who had taken a second wife, and had a numerous family, found himself unable to defray the cost of his son's extravagance. In his 20th year Fielding was compelled to return to England, and was at once thrown upon his own resources, with a fondness for costly pleasures and but slender means of paying for them. His father had promised him an allowance of £200 per annum; but this, as Fielding said, "any one might pay who would." His vivacity, good humor, and talent gained him the companionship of the most eminent wits of his time; and after he arrived in London, while yet a minor, he commenced writing for the stage. His first comedy, "Love in Several Masques," was produced in 1727, when he was but 20 years of age. He wrote his dramatic pieces with great rapidity, and threw into them a marvellous amount of wit and satire. As the pay he received was small, the necessity for constant production left him little time to make elaborate plots, or to pay much attention to the characters of his plays. The "Wedding Day," one of his most successful comedies, gained him but £50, and his pension of a dramatist brought him in contact with acquaintances who were not calculated to improve either his finances or his morals. In the midst of his gay career, while living from hand to mouth by his pen, and writing his plays on the backs of his tavern bills, he formed an acquaintance with Miss Craddock of Salisbury, whom he married in his 27th year. As his wife he had a fortune of but £1,500, the financial condition of the dramatist was not much improved by his marriage. He retired to a small estate in the county which he had inherited from his mother, worth about £200 per annum. He was devotedly attached to his young bride, and made serious resolutions of reform. He gave up writing for the stage, having produced about 20 comedies, farces, and burlesques, one of which was the parody of "Tom Thumb," has kept its place in the theatre. He applied himself with great vigor to literary studies in his country retreat;
but he also gave himself up to such pleasures as the country afforded, and was soon insolvent, and compelled to return to London to retrieve his fortunes. At the age of 30 he entered himself a student at the Inner Temple, studied diligently, and in due course was admitted to the bar. But repeated attacks of the gout compelling him to abandon legal practice, he again had recourse to his pen. He renewed his connection with the theatre, and wrote essays, poems, satires, and whatever else the taste of the day demanded, for literary periodicals. Though he could no longer travel his circuit, he turned his legal acquirements to account by preparing a work on crown law, which evinced his remarkable capacity for patient drudgery. Failing to obtain from these sources the income requisite for his daily wants, he wrote nearly the whole of the literary contents of the "Champion," a periodical which is now only known from his contributions. But now his genius was first attracted to that sphere for which it was best adapted, and in which he was destined to secure an enduring fame. His first novel, "Joseph Andrews" (1749), professedly in the manner of Cervantes' "Pamela," which was then the most popular novel of the time. Fielding's work is infinitely better than the author intended to make it, and, if his fame rested upon that work alone, he would be remembered while the language in which it is written endures. In 1748 he published three volumes of "Miscellanies," including the "Journey from this World to the Next," a work which, though incomplete, and seemingly without any special plan, exhibits much imagination and satirical power. "The History of Jonathan Wild," which appeared about the same time, is a storehouse of wit, profound thought, serious satire, and benevolence so genuine, that even under the guise of the greatest villains we are made to love our brother man. The Newgate ordiny in this great prose satire is the representative of the whole class of worldly-minded ecclesiastics, as much so as Macbeth is the type of unscrupulous ambition, or Othello of noble jealousy. Shortly after the publication of "Joseph Andrews," amid an accumulation of illness, broken fortunes, and constant disappointments, he lost his wife, whom he tenderly loved and most sincerely mourned; though in a few months after her death he married her maid, an act curiously apologized for by his relative, Lady Mary Wortley Montagu. Though he had faithfully served the whig party with his pen, the only reward he received was his appointment, in his 43rd year, when his constitution was completely broken, as an acting magistrate for Westminster. He was not content to confine himself to his official duties, but published several tracts on the causes of crime and pauperism in the metropolis, one of which may be regarded as the first temperance tract ever published; it was "An Inquiry into the Increase of Thieves and Robbers." Robbery was then frightfully prevalent, and he attributed it to the great consumption of gin. Amid all these woes, he found time to write that greatest of all compositions of its class, "Tom Jones, or the History of a Foundling" (1749). His third novel, "The History of Amelia," wherein he portrays the virtues of his first wife and the reckless conduct of his own earlier years, and on which he probably bestowed more careful labor than on any of his other productions, was published in 1793. To eke out his inconsiderable income from his official position and from the sale of his writings, he started in this year another literary undertaking, "The Covent Garden Journal, by Sir Alexander Drawcansir, Knight, Censor General of Great Britain." He now undertook as magistrate, at the request of the duke of Newcastle, the prime minister, to extirpate several gangs of ruffians which infested London; and in this, amid great bodily suffering, and with very meagre recompense, he completely succeeded. But at length his bodily strength would no longer sustain the burden imposed upon it; the dropsey with which he had long been troubled had alarmingly increased, and he was induced to try the influence of a change of climate, Lisbon being selected as the most desirable place for the purpose. He left England June 28, 1754. The journal which he kept of his voyage gives a most touching proof of his affectionate and noble nature in detailing the events of his parting with his family. Though suffering great pain, being hardly capable of moving himself, and forced to be continuously tapped, his intellect retained all its activity; he made a record of all the incidents of his voyage, and he furnishes us in his journal the best account we have of the condition of shipping in the last century, and of the inconveniences, troubles, and delays to which those were subjected who made passages by sea. The climate of Lisbon did not agree with him, and he died two months after his arrival, leaving behind him his second wife and four children, all of whom were generously provided for by his brother Sir John Fielding, aided by his friend Allen, the original of Squire Allworthy, to whom he dedicated "Tom Jones," and in allusion to whom he had said, if a letter were inscribed simply Detur Optimo, there would be few persons who would think it needed any other direction. Great as were the literary labors of Fielding, they were hardly more important than those which he rendered as a police magistrate, in reforming the laws, and in introducing measures for the extirpation of thieves and desperadoes.—The works of Fielding have passed through very many editions, the principal of which are those of 1762 (4 vols. 4to and 8 vols. 8vo, London), with a life of the author; 1784 (10 vols. 8vo), with an essay on his life and genius by Arthur Murphy; 1821 (10 vols. 8vo), edited by Alexander Chalmers; 1840 (imp. 8vo), with a life and notice of his

FIELING, Sarah, an English authoress, sister of the preceding, born in 1714, died in Bath in 1768. Her principal works are "The Adventures of David Simple in search of a Faithful Friend" (2 vols. 12mo, London, 1744; a 9th vol. added in 1759); "History of the Countess of Delwyn;" "History of Ophelia" (2 vols. 12mo, 1785); and "Lives of Cleopatra and Octavia." In 1762 she published a translation of "Xenophon's Memorabilia of Socrates, with the Defence of Socrates before his Judges," in which she was assisted by Mr. Harris.

FIELD MARSHAL. See Marshall.

FIELDS, James Thomas, an American author and publisher, born at Portsmouth, N. H., Dec. 31, 1817. He was educated at the high school of his native city, and at the age of 14 went to Boston to become a clerk in a book store. At 18 he was invited to deliver the anniversary poem before the Boston mercantile library association, Edward Everett being the orator of the occasion. Twelve years later he read before the same society a poem entitled "The Post of Honor," the oration being by Daniel Webster. Soon after he reached the age of 21 Mr. Fields became a partner in the bookselling firm of Ticknor, Reed, and Fields, which about 1844 by the withdrawal of Mr. Reed became the house of Ticknor and Fields, and was soon honorably distinguished by the high character of its publications, especially of poetry. Among the American authors whose works it issued were Emerson, Hawthorne, Holmes, Longfellow, Lowell, Thoreau, and Whittier. Mr. Ticknor died in 1864, and the firm became Fields, Osgood, and Co. In 1870 Mr. Fields withdrew from it to devote himself to authorship and to public lecturing. While a publisher he collected and edited in 33 vols. the writings of Thomas De Quincey. For several years he edited the "Atlantic Monthly." In 1849 he published a volume of his poems, in 1854 printed another for private distribution, and in 1868 a third entitled "A Few Verses for a Few Friends." His latest publication is a volume of prose sketches of his literary friends, entitled "Yesterdays with Authors" (1833). In November, 1875, he delivered six lectures on modern English literature before the Lowell institute at Boston. He visited Europe in 1848, 1851, and 1859.

FIERI FACIAS, the name of a writ at common law, so ancient that its origin is unknown. By it a sheriff, or other competent officer to whom it was directed, was ordered quod fieri facias, de terris et cattalis (or de bonis et cattalis), "that you cause to be made out of the lands and chattels," or "the goods and chattels of," &c., a certain sum of money, being that to which the party for whom the writ was issued was entitled by the judgment of court; and it may be remarked that the only regular foundation for the writ of fieri facias is a judgment of court. It is in fact the great writ of execution in general, though not exclusive, use throughout the United States, and is often spoken, or at least written of, by way of abbreviation, as a.j. fa. By virtue of it the officer to whom it is directed will obtain from the property of him against whom it is directed enough to satisfy the amount of debt or damages and costs, which are always specifically stated in the writ. The rights which this writ confers upon the officer, and the manner in which he is to exercise them, are to some extent matters of statutory regulation. In general it may be said that he must not obtain an entrance to a dwelling by breaking an outer door or window; and it was mainly from this rule that there grew up, with the aid of a little rhetoric, the famous apothegm that "every Englishman's house was his castle." But he may break the outer door of a building disconnected with a dwelling house, as a barn or store; and being peaceably, by voluntary admission or by entry without opposition, within a dwelling house, the sheriff may break open inner doors, or chests or boxes, in search of goods; and it is said that he may do this without the ceremony of asking that they be opened.

FIESCHI (singULAR Fiesco), one of the four principal families of Genoa and its territory, said to be of Bavarian origin. The Fieschi and Grimaldis adhered to the Guelphs, the Doria and Spinolas to the Ghibellines. Their rivalries occasioned frequent wars in the republic of Genoa between the 11th and 16th centuries, when the failure of the conspiracy against the Doria drove the elder branch of the Fieschi into France, and left the younger poor and powerless. They defied the authority of the city in an obstinate struggle in the early part of the 12th century, but finally their castles were captured and destroyed, and they submitted. In 1160 the republic granted them the privilege of erecting a palace in Genoa; and in 1191 they resigned to the republic their castle of Lavagna and their other fiefs, in return for which they received the right of citizenship and nobility. The Fieschi family has produced two popes, Innocent IV. and Adrian V., and a large number of cardinals, patriarchs, archbishops, and bishops, besides statesmen and warriors. (See Fizcoo.)

FIESCHI, Joseph Marie, a French conspirator, born in Corse in 1790, executed in Paris, Feb. 19, 1886. He served in the Russian campaign, and left the army in 1814 with the grade of sergeant. Subsequently joining Murat's fatal expedition to Calabria, he was spared by the Neapolitans as a Frenchman. From 1816 to 1826 he served a term in the penitentiary at Embrun for cattle stealing and forgery. He afterward went to Paris, obtained employment in a manufactory near the Gobelins, and also
served as a policeman and a spy. Convicted of having misappropriated funds intrusted to him as foreman, and of other misdemeanors, he led a miserable life till 1885, when he devised an infernal machine, with 25 gun barrels and many projectiles, for the assassination of Louis Philippe. His accomplices were Morey, a saddler, and Pepin, a grocer, the latter supplying him with money. They hired the third floor of a house in the boulevard du Temple, where Fieschi took up his quarters to await the passing of the king; a fourth accomplice, Boireau, a lamp maker, undertaking to act as watchman. The king, while holding a great military review on July 28, 1885, in celebration of the fifth anniversary of the revolution of 1880, passed the house, in the midst of an immense crowd, accompanied by three of his sons, when the explosion took place, which killed Marshal Mortier, duke of Treviso, chief of the royal staff, Gen. Lachasse de Vézirigny, and Lieut. Col. Riesssec. Altogether 11 persons were killed on the spot, 7 more died soon afterward, and 22 were wounded. The king and the princes escaped with some slight contusions caused by the rearing of the horses. Fieschi, wounded and covered with blood, escaped upon the roof of the house, and thence into a neighboring courtyard; but here he was arrested, and was long under medical treatment. On his recovery he attempted to make light of the affair and to deny his crime, but finally confessed and named as his accomplices Morey, Pepin, Boireau, and one Becher. The last was acquitted. Boireau was condemned to 20 years' transportation; Fieschi, Morey, and Pepin were sentenced to death. During the trial Fieschi bore himself like a stage brigand, continually waving kisses to his mistress; and after the execution of Pepin and Morey, he continued to trifle and attend upon the foot of the scaffold.—See Procès de Fieschi (3 vols., Paris, 1886).

FIESCHI, Giovanni Luigi, count of Lavagna, a conspirator of Genoa, born there about 1524, drowned Jan. 2, 1547. Wealthy, accomplished, and of high rank, he evinced from his earliest youth an inextinguishable love of power, and succeeded in making himself popular with the common people. Andrea Doria was at that time the ruler of Genoa, and although Fieschi was not so much opposed to Andrea as personally exasperated against his nephew Giannettino (who was allowed a precedence of rank which was due to himself), he instigated, in concert with Calacogo, Verrina, Sacco, and other discontented politicians, a conspiracy with the view of overthrowing the existing government. The rebellion broke out in the night of Jan. 1-2, 1547. Giannettino Doria was killed, but his uncle the doge escaped. Fieschi himself fell into the water and was drowned while going on board a galley in the port of Genoa, and his death put an end to the outbreak. The life of his widow was spared, but two of his brothers, Geronimo and Ottoboni, were put to death, and the other leaders of the revolt had their property confiscated and were banished by the doge, although an amnesty had been originally granted to them by the senate. An account of the conspiracy of Fieschi was written in 1629 by Augustino Mascardi, and after him by Cardinal de Retz. It also forms the subject of Schiller's tragedy, Fieschi.

FIESOLS (anc. Fiesola), a town of Italy, in the province and 34 m. N. E. of the city of Florence, with which it is connected by an uninterrupted chain of villas; pop. about 2,500. It is the seat of a bishop, and has a cathedral and an episcopal seminary. In antiquity Fiesola was one of the chief towns of Etruria. Sulla established there a military colony, and the town was the headquarters of Catiline after his escape from Rome. In A. D. 405 the Roman general Stilicho gained near it a great victory over the barbarians under Radagonus. In 1010 it was dismantled and destroyed by the Florentines.

FIESOLE, Giovanni Angelico da. See Angelo.

FIELD, Joseph, a French politician and author, born in Paris, April 8, 1767, died there, May 7, 1889. He lost his father at an early age, and was apprenticed in a printing office, devoting himself also to literature and politics. He embraced the principles of the revolution in 1789, and assisted Condorcet and Millin in editing the Chronique de Paris. Disgusted with the excesses of the terrorists, to whose downfall he contributed in 1794, he entered in 1795 upon a course of royalist partisanship, and was proscribed by the revolutionists, imprisoned in 1799, and restored to liberty on the 18th Brumaire. In 1802 he was sent by Napoleon upon a delicate mission to England, and on his return published a volume of letters concerning that country. In 1810 he was sent to Hamburg to examine the operations of certain agents, and under the first restoration was prefect of the department of Nièvre, from which post he was dismissed by Napoleon on his return from Elba. He afterward took part in editing several royalist journals, and especially contributed by his skill in polemics to the power of the Journal des Debats. He wrote several romances, remarkable for grace and simplicity, published a pamphlet in 1795, Sur la nécessité d'une religion, which first gave him a leading position in the religious and monarchical party, and left a great number of political treatises.

FIFESHIRE, a peninsula of Scotland, bounded N., E., and S. by the frith of Tay, the North sea, and the frith of Forth, and W. by the counties of Clackmannan, Perth, and Kinross; area, 518 sq. m.; pop. in 1871, 160,810. The surface of the country is much diversified. The chief mountains are the Lomond hills, Large Law, and Norman Law. The soil is of various quality, but so productive in general that fully two thirds of the whole is under cultivation. Agriculture is in a very advanced state.
The Fife breed of cattle have long been celebrated, and are in high repute both at home and in the English markets. Coal, iron, limestone, and freestone are abundant. Coal has been worked for several centuries, but ironstone, especially that called blackband, is of recent discovery. The principal manufacture is linen, which is carried on very extensively at Dunfermline and Kirkcaldy. There are salmon fisheries in several of the rivers, and herring, cod, turbot, and haddock fisheries on the coasts. The principal towns are Dunfermline, Kirkcaldy, Cupar, Dysart, and St. Andrews.

FIG, the fruit of the *Ficus carica* (Linn.), a tree which is indigenous to Asia and Barbary, and is much cultivated in the warmer portions of the globe. The leaves of the fig tree are rough, lobed, and deciduous. The flowers are so curiously concealed from observation, that many persons think it has none, though they are very numerous, being borne inside of a succulent, hollow receptacle, which first appears on the sides of the young shoots like a small round bud. This receptacle is called a sycorus, and on being cut open the minute, chaffy, spathose florets, each furnished with three stamens and two styles, will be seen lining its walls. If these florets have become duly impregnated, the sycorus, after having remained entirely at rest for some time at half its growth, begins to swell again, augments considerably in size, becomes very pulpy and sweet when it ripens, assumes some kind of color, and is the fig. The pulp, sweet mass will be found to be penetrated with small round seeds, each of which is the result of a minute chaffy floret. The fig tree attains a height of 20 ft., with a branching, spreading head, like an apple tree, in those countries where it is indigenous; but in northern countries it is seldom seen except as a shrub, unless when trained under glass. In the middle states, where cultivated in the open air, it is purposely kept low and shrub-like, so that it may be bent to the ground and covered with earth in the winter, to protect it from frosts. In England the tree is usually planted against a low wall, in order that it may receive some of the heat reflected from the surface of the soil. Such walls are sometimes furnished with flues to conduct artificial heat to the ripening crops of figs in autumn. In some parts of France it is grown as a dwarf standard tree, the chief end being to keep the branches short, low, and spreading, in order that they may benefit by the sun’s rays reflecting heat from the earth. The soil is manured occasionally and stirred once a year, and some slight protection is given to the lower branches and base of the trunk in the winter. In the south of England it has been treated in the same way with success. Two or more crops of fruit are produced from the fig tree by judicious pruning and training, each crop being produced on distinct sets of shoots. The second crop, for instance, grows from the eyes or buds of the shoots made in early summer, and if the season be sufficiently long and warm, the fruit will ripen; but this seldom happens in the open air. In hot climates the second crop is the most productive and valuable, being what are called summer figs, and used for exportation. By continued high temperature eight crops a year have been produced in England.—The fig tree is easily propagated from cuttings, or by ringing some branch and surrounding the cut place by a small pot of earth, into which the roots will penetrate and increase to such extent that the branch may be separated before the fruit upon it has ripened. Branches also girdled by removing a narrow ring of the bark below the fruit-bearing parts, will produce earlier ripening figs, the process being found as safe and efficacious as with the pear tree or the grape vine. It is cultivated to a considerable extent around Boston, Mass., in conservatories and forcing houses such as are used in the cultivation of forcing grapes. Trellised upon the back wall of such structures, by using espaliers or by nailing in the branches, a single tree may be made to produce large crops. The branches are spread out horizontally, and so arranged that they can be loosened from the walls, pruned, washed, and cleaned when necessary. Judicious management is important to prevent too great growth of young or useless shoots. By this mode two crops are secured.—There are many choice varieties of the fig, each having some peculiar merit. The London horticultural society’s catalogue for 1842 gives 42 varieties, and in this number are comprised fruits of white, green, yellow, and brown colors. As an abundant bearer, and harder than any other, the brown Turkey fig seems to be preferred. Downing considers it the best for the open air, and says that it has a delicious flavor. The brown Ischia, white Marseilles, Brunswick, and white Ischia are highly commended. The fresh ripened fig is delicious and luscious. Few, however, fancy it on first acquaintance, but experience soon decides in its favor over the
dried and pressed fruit of commerce. Nearly all the figs consumed in the United States and Great Britain are produced in Turkey.—The genus Ficus includes also the banana and the East India rubber tree.

FIGEAC, a town of France, in the department of Lot, on the railway from Périgueux to Ro-dex, in a deep valley of the Cédé or Selle, an affluent of the Lot, 80 m. N. E. of Cahors; pop. in 1866, 7,610. It has a communal college, a library, a chamber of agriculture, a magnificent bridge, a railway tunnel 4,100 ft. long, manufactures of linen and cotton fabrics, dyeing houses, tanneries, &c., and some trade in wine and cattle. It is supposed to owe its origin to a Benedictine abbey, founded in 765 by Pepin the Short. It is the birthplace of the Chambollins, to the younger of whom a statue has been erected.

FIGERA, a town of Spain, in the province of Gerona, Catalonia, situated on the road from Pervigan to Barcelona, 31 m. N. N. E. of Gerona and 14 m. from the French frontier; pop. about 10,600. The citadel or castle of San Fernando is regarded as one of the strongest fortresses of Spain. It was built about the middle of the 18th century, and will serve as an intrenched camp for 16,000 men. It was, however, captured by the French in 1808, re-taken by the Spaniards in 1811, again captured by the French in the same year, and also in 1829.

FIGUEIREDO, António, a Spanish statesman, born in Barcelona, Nov. 18, 1819. After completing his studies he espoused the ultra liberal cause, but subsequently separated himself from it and became one of the editors of a journal which supported Espartero. In 1851 he was elected to the cortes; in 1854 he was a member of the Tarragona revolutionary committee, and in 1862 was re-elected to the cortes. He was connected with the revolutionary attempts in 1866, and was imprisoned by Narvaez in 1867. After the downfall of Isabella (1868) he became a member of the revolutionary committee and judge. Subsequently he was again sent to the cortes, where he became a prominent leader of the republican party, and after the abdication of King Amadeus (Feb. 11, 1870), and the formation of the republic, he was appointed president of the executive council. Subsequently he was minister of the interior until the end of April, when he retired on occasion of the death of his wife.

FIGUEROL, I. Francisco de, a Spanish poet, born at Alcalá de Henares about 1640, died about 1680. He received a university education, served in the army, and in 1673 accompanied Carlos of Aragon, duke of Terranova, to Flanders. He wrote in Italian and in Spanish, and was called "the divine poet." His eulogy of Tirso (his nom de plume) contains the first good Spanish blank verse. His poems, first published in 1625-6, were re-published in Ramon Fernandez's collection (Madrid, 1786-1804). II. Cristóbal Suarez de, a Spanish author, born in Valladolid about 1680, died about 1680.

was a jurist and a soldier, and resided for a long time in Italy. His principal works are: La constante Amarilla, a pastoral romance in prose and verse (Valencia, 1614; French translation, 1614; 8d and best Spanish edition, Madrid, 1781); El pasagiero (Madrid, 1617), a half narrative, half didactic work, containing his autobiography and severe attacks on Cervantes, Lope de Vega, and other dramatists; and Plata universal de todas ciencias y artes (Madrid, 1615; new and enlarged ed., 1787).

FIGURIER, Guillaume Louis, a French writer on scientific subjects, born in Montpellier, Feb. 15, 1819. He studied chemistry under his uncle Pierre Oscar Figuière, became a physician in Paris in 1842, professor of pharmacy in Montpellier in 1846 and in Paris in 1853, and wrote numerous scientific articles for the press. Among his many works are: Exposition et histoire des principales découvertes scientifiques modernes (4 vols., 1851-7; 8th ed., 1862); Histoire de la médecine moderne (4 vols., 1859-63); and Vie des savants illustres depuis l'antiquité jusqu'à l'XIIX siècle (1866). Among recent English translations of his writings are the following: "The World before the Deluge" (new ed., 1 vol., 1866); "The Vegetable World" (1867); "The Ocean World" (1868); "The Insect World" (1868); "Birds and Reptiles" (1870); "Mammalia" (1870); "The Primitive Man" (1870); "Theorrow of Death" (1871); and "The Human Race" (1872). These works are copiously illustrated, and have been widely circulated in the United States. M. Figuière edits L'Année scientifique et industrielle, which has led to the publication of many similar annuals.—His wife, Julienne Bourcaren, has published novels, and a drama, "Gutenberg" (1869).

FIGLIERI, L. Calame, an Italian publicist, born in Naples, Aug. 18, 1752, died July 21, 1788. From 1777 he held various offices at court, and in 1787 he was called to the supreme council of finance. His principal work is the Scienze della legislazione, the first four books of which were published between 1780 and 1784, and the fifth was left unfinished at his death, caused prematurely by his excessive labors. The Scienze has been translated into German, French, English, and Spanish. II. Carlo, duke of Taormina, son of the preceding, born in Naples in 1788, died in 1867. He was indebted for his military education at Paris to the kindness of Napoleon I., fought in the ranks of the French at the battle of Austerlitz, served in the Neapolitan army under Murat, and bravely exposed himself to the fire of the Austrian riflemen in 1815 by making a reconnaissance at the bridge of the Tanaro with only 80 men, on which occasion he was severely wounded. King Ferdinand II. placed him at the head of the artillery and of the engineers, employed him in 1848 in bombarding Messina and in quelling the rebellion in other parts of Sicily, and invested him as governor general of that island with unlimited power. During the short
FILBERT

reign of Francis II. (1589–90) he was premier and minister of foreign affairs.

FILBERT. See HAZEL.

FILIBUSTER. The river Vly in Holland is said to have furnished the name flyboat in Eng-

lish, in Spanish filibote, or by a softening of the first syllable, filibote, to a sort of small fast-sail-

ing vessel of about 100 tons burden, which in the 17th century held in point of sailing qual-

ities the place since occupied by the Baltimore clippers. The buccaneers of the West Indies,

who began their depredations against Spanish commerce in mere row boats, as they acquired

the means for a more formidable outfit, select-

ed these vessels as the sort of craft best suited to their purpose. (See BUCCANEER.) Hence

they became known in French as filibusters, and in Spanish as filibusteros, an appellation

gradually extended in those languages to any

kind of pirates. The term filibuster has re-

cently been introduced into the English lan-

guage—its use commencing in New Orleans, but thence rapidly spreading wherever English

is spoken—as a designation for certain adven-

turers who, after the termination of the war

between Mexico and the United States, busied

themselves with setting on foot within the

United States military expeditions designed to

operate in the Spanish American countries to

the south of us. Of these the expeditions un-
der William Walker to Nicaragua were the most

noted.—Filibustering is a cant term much

used of late years in the legislative assem-

blies of the United States to designate the

employment of parliamentary tactics to defeat

a measure by raising frivolous questions of

order, calls of the house, motions to adjourn,

&c., in order to weary out the opposite party,

or to gain time.

FILIALLE, Vincenzo de, an Italian lyric poet,

born in Florence in 1642, died there, Sept. 24,

1707. His grandfather and father were sena-

tors, and he was educated with a view to that

position. He studied in Italy, and came to this

country in 1688. He wrote in Latin and Italian

verse, but the object of his affections dying in

her youth, he determined thenceforth to write

only on sacred or heroic themes. After his

marriage, having only a small fortune, he re-

tired to the country and gave his attention to

the education of his children and to study. At

this time he wrote many Latin and Italian

poems, but without any intention of publishing

them. After the raising of the siege of Vienna

by the Turks in 1683, he celebrated the tri-

umph of the Christian arms by elegant odes

addressed to John Sobieski, to the emperor

Leopold, to the duke of Lorraine, to the God

of armies, &c. The ex-queen Christina of

Sweden, whom he also celebrated, undertook
to defray the expenses of his son's education.

He was appointed by the grand duke of Tus-

cany senator, and governor of Volterra, and

afterward of Pisa. He then began the task of

preparing his works for publication, but died

before its completion. His son published them

under the title of Poesie toscane di Vincenzo

da Filicaja (4to, Florence, 1707; 2 vols. 8vo,

Venice, 1782). His sonnet L'Italia is es-
temed among the finest in the Italian language.

FILIGREE (It. filigrana, from Lat. plenum,

thread, and granius, a grain), ornamental work

in fine gold or silver wire, often made with

little metallic beads or grains interspersed

among the wires. The work may be complete

in itself, or it may be used, as is the common

method, by applying the wire in flattened and

twisted shapes upon the surfaces of the trinkets

or whatever else it is designed to adorn, and

soldering it there in the patterns of stems and

leaves of plants. It is much practised by the

Italians, who derived the art from the eastern

nations. In the production of silver filigree,

artistically wrought into bracelets, flowers,

and other ornaments, the Genoese workmen stand

unrivalled, and their productions are sent to

all parts of the world. In Sumatra the manu-

facture of filigree has been carried to great

perfection, although the tools employed are

course and clumsy. The wire-drawing tool is

made of a piece of wire hoop; an old hammer

stuck in a block serves for an anvil. The gold

is melted in a crucible over a fire, a joint of

bamboo blown through by the workman being

often the only bellows. When the filigree is

finished they cleanse it by boiling in water with

common salt, alum, and lime juice, and to give

it the fine purple color they call sepe they boil

it in sulphur water. The Chinese also make

filigree, principally of silver, but of inferior
elegance to the Malay work.

FILLMORE. I. A S. E. county of Minnesota,

bounded S. by Iowa; area about 900 sq. m.;
pop. in 1870, 34,867. It is intersected by Root

river and its branches, and has a rolling surface

and an excellent soil. The Southern Minne-

sota railroad passes through it. The chief pro-

ductions in 1870 were 1,664 bales of wool, 1,988

bushels of wheat, 889,956 of Indian corn, 976,981 of oats,

108,885 of barley, 22,409 of potatoes, 28,908

tons of hay, 596,114 lbs. of butter, and 27,187

of wool. There were 6,568 horses, 8,093 milch

cows, 10,781 other cattle, 10,842 sheep, and

10,809 swine; 2 manufactories of carriages and

wagons, 5 of barrels and casks, 1 of machinery,

6 of saddlery and harness, 1 of sashes, doors,

and blinds, 8 of woollen goods, 4 flour mills,

and 6 saw mills. Capital, Preston.

II. A S.

E. county of Nebraska, drained by the N. fork

of Turkey creek and the W. fork of Big Blue

river; area, 876 sq. m.; pop. in 1870, 238. It

is traversed by the Burlington and Missouri

River railroad.

FILLMORE, Millard, thirteenth president of the

United States, born in the township of Locke

(now Summerhill), Cayuga co., N. Y., June 7,

1800, died in Buffalo, March 8, 1874. Cayuga

co. was then a wilderness, with few settle-

ments. The nearest house to that of the Fill-

mores was 4 m. distant. Young Fillmore's
education was limited to instruction in reading, writing, spelling, and the simplest branches of arithmetic. At 14 he was apprenticed to learn the fuller's trade. In 1819 he conceived the design of studying law. He had yet two years of his apprenticeship to serve, and agreed with his employer to relinquish his wages for his last year's services, and promised to pay him $30 for his time. He made an arrangement with a retired lawyer, by which he was to receive his board in payment for his services in the office. In 1821 he went on foot to Buffalo, where he arrived an entire stranger, with $4 in his pocket. Here he obtained permission to study in a lawyer's office, and supported himself by severe drudgery in teaching school and assisting the postmaster. By the spring of 1828 he had so far gained the confidence of the bar, that by the intercession of several of its leading members he was admitted as an attorney by the court of common pleas of Erie county, although he had not completed the period of study usually required, and commenced practice at Aurora, where his father then resided. In the course of a few years he acquired not only a large practice, but a thorough knowledge of the principles of the common law, which placed him in the first rank among the lawyers of the state. In 1827 he was admitted as attorney and in 1829 as counsel of the supreme court of the state. In 1830 he removed to Buffalo, where he continued in the practice of the law until the autumn of 1847, when he retired from it on being elected comptroller of the state.—Mr. Fillmore's political life commenced in 1828, when he was elected representative to the state legislature by the anti-masonic party. He served three successive terms, retiring in the spring of 1831. He particularly distinguished himself by his advocacy of the act to abolish imprisonment for debt, which was passed in 1831, and which was drafted by him, excepting the portions relative to proceedings in courts of record, which were drawn by John C. Spencer. In the autumn of 1832 he was elected on the anti-Jackson or anti-administration ticket to congress. After serving one term he retired till 1836, when he was re-elected as a whig. He was chosen again in 1838, and again in 1840. In 1842 he declined a renomination. In congress he rose gradually to the first rank for integrity, industry, and practical ability. During the early part of his congressional career a national bank was the prominent subject of discussion. Mr. Fillmore was never a warm friend of the bank, and took no part in the debates upon it. He was, however, a decided whig, and labored earnestly in support of the internal improvement and protective tariff policy of the party. It was upon the question of the reception of petitions for the abolition of slavery in the 25th congress, he supported Mr. Adams, and voted for their reception. In a letter written Oct. 17, 1838, he avowed that he was opposed to the annexation of Texas so long as slaves should be held therein; that he was in favor of congress exercising all its constitutional powers to abolish the slave trade between the states, and in favor of immediate legislation for the abolition of slavery in the District of Columbia. He expressly stated, however, that he would not pledge himself as to his future course upon any of these subjects; but reserved the right to modify or change his views, as upon further reflection or examination he might deem proper. He took a prominent part in the debates in congress upon the subject of the burning of the steamer Caroline by British troops at Schlosser, on the Niagara frontier, in December, 1837. At the opening of the 26th congress, Dec. 2, 1839, the seats of five out of the six members from New Jersey were contested. The claimants who held the certificate of the governor were whigs; and so evenly were the parties in congress balanced, that if these were admitted to their seats the whigs would have the control of the organization; if not, it would be in the hands of the democrats. The whigs contended that the certificate of the governor, authenticated by the seal of the state, should be received as presumptive evidence of the right of the five members to their seats; that they should be permitted to participate in the organization of the house, and that afterward the claims of contestants to their seats should be investigated in the ordinary course of business. The democrats insisted that the house should decide the question before electing a speaker. A violent debate arose. Two weeks were consumed in discussing whether the five New Jersey members should be permitted to participate in organizing the house. A resolution to admit them was lost by a tie vote. A speaker was chosen on Dec. 16, and the discussion was then resumed. Mr. Fillmore was assigned a place on the committee on elections. He canvassed the entire vote of the state of New Jersey, devoting three months to this drudgery. A majority of the committee, being democrats, reported that the democratic contestants were entitled to the seats. The minority of the committee were satisfied that three at least of the whig members were unjustly excluded by the majority report. On March 6, by a strict party vote, overruling the decision of the speaker, Mr. Fillmore was declared to be out of order while supporting his views on this question, and all further debate was substantially prohibited. On March 10 the democratic contestants were admitted to their seats, and their title to them was confirmed by a party vote on July 16. Mr. Fillmore was one of the most prominent actors in this controversy, and by his labor in the committee and on the floor, which took place upon the question of the reception of petitions for the abolition of slavery in the 25th congress, he supported Mr. Adams, and voted for their reception. In a letter written Oct. 17, 1838, he avowed that he was opposed to
new financial system, and an entirely new tariff, were to be devised and put in operation. Under the circumstances the position of chairman of the committee of ways and means was the most prominent in the House. It was assigned to Mr. Fillmore. The session continued nine months, during which time he was not absent a single hour from the house, though he did his full share of the labors of the committee. The preparation of the new tariff bill involved a laborious examination, digestion, and arrangement of figures and statistics. Although Mr. Fillmore did not profess to be the discoverer of any original system of revenue, still the tariff of 1842 was a new creation, and he is justly entitled to the distinction of being its author. At the same time, with great labor, he prepared a digest of the laws authorizing all appropriations reported by him to the house as chairman of the committee of ways and means, so that on the instant he could produce the legal authority for every expenditure which he recommended. Sensible that this was a great safeguard against improper expenditures, he procured the passage of a resolution requiring the departments, when they submitted estimates of expenses, to accompany them with a reference to the laws authorizing them in each instance. This has ever since been the practice of the government.—Mr. Fillmore retired from congress in March, 1848. He was the candidate for vice president, supported by his own state and by some of the western states, in the whig national convention which met at Baltimore, May 1, 1844. In the convention of the whigs of the state of New York, which met Sept. 11, he was nominated for governor, but was defeated by Silas Wright, Mr. Clay being defeated at the same time in the presidential election by Mr. Polk. In 1847 Mr. Fillmore was elected comptroller of the state of New York, an office which at that time included in its sphere many duties now distributed among various departments. In his report of Jan. 1, 1849, he suggested that a national bank, with the stocks of the United States as the sole basis upon which to issue its currency, might be established and carried on so as to prove a great convenience to the government, with entire safety to the people. This idea involves the essential principle of our present system of national banks.—In June, 1848, he was nominated by the whig national convention for vice president, with Gen. Zachary Taylor for president, and was elected in the ensuing November. In February he resigned the office of comptroller, and on March 5, 1849, was inaugurated as vice president. In 1826 Mr. Calhoun, then vice president, had established the rule that that officer had no power to call senators into session. During the controversy in the session of 1849-'50 occasioned by the application of California for admission into the Union, the question of slavery in the new territories, and that of the rendition of fugitive slaves, in which the most acrimonious language was used, Mr. Fillmore in a speech to the senate announced his determination to preserve order, and that, should occasion require, he should reverse the usage of his predecessors upon that subject. This announcement met with the unanimous approval of the senate, which ordered Mr. Fillmore's remarks to be entered at length on its journal. He presided during the controversy on Mr. Clay's "omnibus bill" with his usual impartiality. No one knew which policy he approved excepting the president, to whom he privately stated that should he be required to deposit his casting vote, it would be in favor of Mr. Clay's bill. More than seven months of the session had been exhausted in angry controversy, when, on July 9, 1850, President Taylor died. Mr. Fillmore took the oath of office as president on July 10; President Taylor's cabinet at once resigned, and a new cabinet was nominated on the 20th. Its members were: Daniel Webster of Massachusetts, secretary of state; Thomas Corwin of Ohio, secretary of the treasury; A. H. H. Stuart of Virginia, secretary of the interior; Charles M. Conrad of Louisiana, secretary of war; William A. Graham of North Carolina, secretary of the navy; Nathan K. Hall of New York, postmaster general; and John J. Crittenden of Kentucky, attorney general. Of these, Mr. Webster died and Messrs. Graham and Hall retired in 1852, and were respectively replaced by Edward Everett of Massachusetts, John P. Kennedy of Maryland, and Samuel D. Hubbard of Connecticut. Mr. Fillmore immediately ordered a military force to New Mexico, with instructions to protect that territory from invasion by Texas, on account of its disputed boundary. Mr. Clay's bill having been in the mean time defeated, Mr. Fillmore on Aug. 6 sent a message to congress advising that body of the danger of a collision with Texas, and urging a settlement of the controversy in respect to its boundary. Various acts known as the compromise measures, and embracing substantially the provisions of Mr. Clay's bill, were passed before the end of the month. The president referred to the attorney general the question whether the act respecting the rendition of fugitive slaves was in conflict with the provisions of the constitution relating to the writ of habeas corpus. That officer prepared a written opinion in favor of its constitutionality. The president concurred in this opinion and signed the act, together with the rest of the compromise measures. The fugitive slave law was exceedingly offensive to great numbers of the whig party of the north, as well as to those known strictly as anti-slavery men. Its execution was resisted, and slaves were rescued from the custody of the police in New York, Boston, Syracuse, and Christians in Pennsylvania, in the last of which places one or two persons were killed. The president announced his intention to enforce the law, and issued a proclamation calling upon all officers to per-
form their duty in its execution. Prosecutions were instituted in various instances against the rescuers, but without practical results, owing to the unpopularity of the law. Although Mr. Fillmore's administration, as a whole, was acknowledged to be patriotic, able, and useful; although his purity as a public man was unquestioned, and not a single other measure of his administration could be called unpopular, still, by signing the fugitive slave law, he lost the support of a very large proportion of his party in the northern states. In his message to Congress in December, 1850, he recommended considerable reductions in postage; the establishment of an agricultural bureau; liberal appropriations for rivers and harbors; the establishment of an asylum for the relief of disabled and destitute seamen; a moderate but permanent tariff, with specific duties where practicable, and discriminating in favor of American industry; the opening of communication between the Mississippi and the Pacific; a provision for settling disputed land titles in California, and an extension of the system of land laws over the newly acquired territory; a law to provide for the retiring of superannuated officers from active service in the army and navy; a board of commissioners for the adjustment of private claims against the government; and, in conclusion, "an adherence to the adjustment established by the compromise measures, until time and experience should demonstrate the necessity for future legislation to guard against evasion and abuse." But his administration being in a political minority in both houses of Congress, none of these recommendations were adopted, excepting those for the settlement of land claims in California and the survey of its public lands, and for an asylum for disabled and destitute seamen. During this session Congress made an appropriation for the extension of the capitol according to such plan as might be approved by the president. Having adopted a plan, on July 4, 1851, he laid the corner stone of the extension, amid an immense concourse of people, who were addressed by Daniel Webster. Learning that an attempt was to be made to invade Cuba by lawless citizens of the United States, the president, on April 25, 1851, issued a proclamation warning them of the consequences. On Aug. 4, however, an expedition under Lopez, in the steamer Pampero, sailed from New Orleans by the connivance of the collector of that port and landed in Cuba. They were there captured; a number were executed, a few pardoned, and the remainder sent prisoners to Spain. Those sent to Spain were finally pardoned, and Congress paid their expenses home. The collector of New Orleans was removed from office, and the steamer Pampero seized by the government, and condemned and sold for a violation of the neutrality laws. In his message of 1851, besides reiterating the views expressed in that of 1850, the president urged a revision of the fee bill of the United States courts, a thorough revision and codification of the laws of Congress then in force, and a law prescribing the relative rank of officers in the army and navy. Mr. Fillmore's administration is distinguished by the expedition of Commodore Perry to Japan, in a squadron which sailed in the autumn of 1852, and which resulted in a favorable treaty with that country. During the years 1851 and 1852 treaties were also formed with Peru, Costa Rica, Brazil, and other South American states. A steamer was sent to explore the Plata and its tributaries. An expedition was also ordered by the president to explore the valley of the Amazon. This accomplished its object, and instructive reports were made by Lienitz, Herndon and Gibbon. Mr. Fillmore carried out strictly the doctrine of non-intervention in the affairs of foreign countries, and frankly stated his views upon this subject in an interview with Kossuth. At the same time, however, it appeared clearly enough by the celebrated letter of Mr. Webster, secretary of state, to M. Hildebrand, how little the administration sympathized with Austria in its struggle with Hungary. Daniel Webster died Oct. 24, 1852, and Edward Everett was appointed his successor as secretary of state. His brief term of office was distinguished by his letter declining the proposition for a tripartite treaty with England and France, by which each country was to disclaim then and for the future all intention to obtain possession of the island of Cuba. But in his message to Congress in December, 1852, the president expressed his opinion that the incorporation of Cuba into the Union would be a hazardous and impolitic measure.—Mr. Fillmore retired from the presidency March 4, 1853. He left the country at peace within and without, and in the enjoyment of a high degree of prosperity in all departments of its industry. In his cabinet there had never been a dissenting voice as to any measure of his administration; and upon his retiring from office a letter was addressed to him by all its members, expressing their united appreciation of his abilities, his integrity, and his devotion to the public service. At the Whig convention of 1852 he was a candidate for nomination as president; but though his policy, the fugitive slave law included, was approved by a vote of 227 against 60, he could not command 20 votes from the free states. During the spring and summer of 1854 he made an extensive tour through the southern and western states. In the spring of 1855, after an excursion through New England, he sailed for Europe, where he remained until June, 1858. While at Rome he received the news of his nomination as candidate for the presidency by the American party. He accepted the nomination, but before the close of the campaign it became evident that the real struggle was between the democrats and the republicans. Very many of those with whom he was the first choice for president cast their votes either for
Mr. Buchanan or Mr. Fremont, believing that there was no hope of Mr. Fillmore's election; and though he received the support of large numbers in all the states, Maryland alone gave him its electoral vote. Mr. Fillmore afterward resided in Buffalo, taking no prominent part in public affairs.

**FILTER**, an apparatus for separating from fluids the foreign substances mechanically intertwined with them. Beds of sand and gravel constitute natural filters, through which the surface water from rain percolates and may be collected in wells, or through which springs may pass upward from substrata. Artificial filters are constructed upon the same principle; a diaphragm of some substance is presented, through the pores of which the fluid can penetrate, but which are so fine that they arrest the particles held in suspension. They are variously constructed according to the nature of the fluid to be purified. The chemist takes a disk of thick unsized paper prepared for the purpose, doubles it twice, introduces it into a funnel of proper size, which, for facilitating the passage of the fluid, is commonly ribbed, opens one of the folds, and pours in the liquid. The fluid portion passes through the paper, leaving all the solid particles upon the filter. Filters used by chemists and apothecaries are usually made of paper, but felt, cloth, and cotton, woven and unwoven, are often used, as also layers of charcoal, sand, asbestos, and similar materials. The old pharmacists used a conical bag of cotton or woolen called Hippocrates’s sleeve, and the same contrivance is still considered one of the best for the clarification of sirups and other viscid liquids. The conical hat body made of felt is well adapted, before its shape is altered, to the filtration of fixed oils. Corrosive liquids, as strong acids, may be cleared by passing them through pure silicious sand supported upon coarse fragments of glass placed in the neck of a funnel and gradually diminishing in size upward. Charcoal is a favorite material, particularly for the purification of water used at sea; it has the property not only of separating the impurities passed through layers of it alternating with others of sand, but also of removing disagreeable odors. The Japanese use porous sandstone hollowed into the form of an egg, and set in a frame over a vessel, into which the water drops as it percolates through the stone. The Egyptians adopt the same method for clarifying the water of the Nile. A stone which answers this purpose well has long been known at Teneriffe, and was formerly largely imported into England. In Spain porous earthyware vessels are manufactured, called alcar recurring, which are used for this purpose, and also for filtering wine. An interesting notice is given at the London international exhibition of 1861, sent by the Wenham lake ice company of Massachusetts, the invention of Mr. Alfred Bird. It consists of a siphon, the short limb of which terminates in a cylindrical box, which is placed in a cask of water under the surface. This box contains the filter, and on drawing the air out of the long arm, which projects from the cask, the water is forced up through the filter and passes through the siphon, its flow being regulated by a stopcock at the lower end of the long arm. It has the advantage, if the cask is kept properly supplied, of drawing the water neither from the top where the lighter sediment collects, nor from the bottom to which the heavier impurities sink. Filters upon a large scale are connected with the reservoirs from which cities receive supplies of water. These reservoirs are divided into several basins, the first of which are intended for receiving the sediment that will subside as the water is left standing; from these it passes through porous beds which separate them from an adjoining basin, and which collect the impurities still remaining suspended. By using several such basins the beds may be kept alternately in use, affording an opportunity for cleansing them whenever this is required. In many large reservoirs, as the Croton, no filtering apparatus is used, the water passing from the first to the second, and even to the third and fourth, and the separation of clear water and sediment being effected by precipitation. The water of such reservoirs is often filtered by attaching diaphragms to the delivering pipes in the houses.—In connection with the purification of water by filtration, ingenious methods have been devised of separating the soluble salts of lime, which give the property of hardness to water, and which being in the state of solution pass through the filter. Pure water can hold only about two grains to the gallon of carbonate of lime, or $\frac{2}{3}$; but as the water absorbs carbonic acid gas, its power of dissolving carbonate of lime increases till its capacity may be ten times that of pure water. Its hardness increases with the quantity of lime taken up. Thus the water of springs, especially in districts where calcareous rocks abound, differs in composition from the soft rain water which has not flowed through the ground. When such water is boiled, the excess of carbonic gas is expelled, and with it the capacity of holding a portion of the carbonate of lime. This falls as a precipitate, and forms the crust which collects on the inside of kettles in which such water is boiled. By continuing the boiling, all the lime may be thus separated, except about two grains to the gallon; and it is then in the best condition to be purified by filtering. Other salts, the solubility of which does not depend upon the carbonic acid gas present, can only be separated by distillation. Some substances often present in the state of suspension in water cannot be separated either by chemical or filtering means; such are some organic matters, and the fine clayey or aluminous particles. Waters which wash cliffs of clay become saturated with the impalpable material, which they almost wholly refuse to shed by any mechanical action. This
property may be witnessed upon a large scale in passing in a steamboat along the north shore of Lake Erie, where the water, particularly after a storm, carries the drift from the clayey banks miles out into the lake, and receives from it a milky appearance.

FINBACK. See ROSEATE.

FINCH, a name given to many birds of the order passerines, suborder oscines, tribe conornithes, and family fringillides, including a numerous series of small and generally brilliant birds, with short, thick, more or less conical bill, without emargination at the tip. This family, according to Gray, comprises the subfamilies plococina, or weavers, African for the most part, except the typical genus plocus (Cuv.), which is Asiatic; cocothraustina, or hawfinches, well scattered over the globe, of which the rose-breasted grosbeak is a familiar representative in the United States; tanagrina, or tanagers, peculiar to this continent, especially to South America; fringillina, or finches, found all over the world; emberiza, or buntings, of which the common snow bunting is a good example; alaudina, or larks, of which the shore lark of the north and a second species on the Pacific coast are the only American specimens; this subfamily is by some, and with good reason, removed from the fringillidae; pyrrhulina, or bullfinches; iciina, or cardinals; and phrynotinae, or plant-cutters. The characters of the bullfinch, bunting, and crossbill have been given under those titles respectively; those of the grosbeaks, hawfinches, larks, plant-cutters, tanagers, and weavers, will be noticed in their alphabetical order; leaving nothing for this article but the proper finches.—The characters of the fringillinae are, in addition to those already alluded to as belonging to the whole family, wings more or less lengthened and pointed; tail varying in length, sometimes with the feathers acuminate; tarsi rather shorter than the middle toe, in a few cases as long, slender and transversely scaled; toes long and slender, the hind toe moderate, with the claws curved and acute. The genus estrilda (Swains.) is found in Africa, Asia, and Australia, occurring in small flocks in meadows and bushy grounds, and occasionally visiting gardens. The wax-billed finch, or bengalyn (E. astrild, Linn.), is of the size of a wren, about 4½ in. long, and a streak through the eye and the middle of the breast are of the same color; the general color above is brown, and below reddish gray, everywhere crossed with fine blackish undulations. This handsome bird inhabits Africa from Senegal to the Cape of Good Hope; it often commits considerable havoc in gardens, where it devours both buds and seeds; it is frequently kept in cages, more for its beauty than its song. The wings in this genus are short, and the flight is consequently for small distances at a time; the tail is lengthened. There are more than 40 other species. As a specimen of the genus amadina (Swains.), differing from the last chiefly in a more uniformly conical bill and in a short and rounded tail, may be mentioned the Java finch, commonly called here Java sparrow (A. orestias, Linn.); other names are the paddy and rice bird. This is of the size of a sparrow, in length about 5 in.; the bill is stout and red; the eyelids are of the same color; the head and throat black; the sides of the head, under the eyes, white; the upper parts pale ash; belly and thighs pale rose, white toward the vent; the tail black. It inhabits Java, China, and India, where it occasionally does much mischief in the rice grounds; it eats seeds and insects; it is often seen here as a cage bird, and is a favorite for its beauty. There are more than 80 other species of the genus.—The typical finches are found in the genus fringilla (Linn.), which is distributed over all the world, living in flocks in which are often associated several species; their food consists of seeds of various kinds of plants and trees in winter, and of insects, grains, and grain in summer; as the redpoll and the snow bird, are found in very cold regions. There are more than 80 species, which by Gray were brought under the Linncean genus fringilla; some of the old subdivisions have been readopted in Prince Bonaparte's Conspectus Avium, and in Baird's catalogue of North American birds, but the simpler method of Gray will be adhered to in this article. In the genus fringilla the wings are long and pointed, and the tail is generally slightly forked. The chaffinch (F. caelebs, Linn.) has been described under that title, and the siakin (F. spinus, Linn.) under Aberdeenshire; the goldfinch (F. carduelis, Linn.), the redpoll finch (F. linaria, Linn.), the snow bird (F. junco) hengemis, Linn.), and the yellow bird or American goldfinch (F. [chryspomitra] tristis, Linn.), will be described under their respective names.—The Brambling or mountain finch (F. montifringilla, Linn.) is a little smaller than the chaffinch, being about 6½ in. long, with an extent of wings of 10½ in.; it resembles this bird in its form, mode of flight, gait, and manners; the bill is larger in proportion. The greater part of the upper mandible and the end of the lower are dusky, the base of the former pale gray, and the rest of the latter yellow; the head and back in the male are deep black, the feathers with a tinge of rust; the throat, breast, and upper wing coverts are light reddish brown; the rump white tinged with yellow; the quills and larger coverts black, the former margined with yellow externally, the inner with a reddish margin and a white spot at the base; the sides spotted with black; the tail black; the exterior feather white on the outer web, and the middle ones edged and tipped with ash color; abdomen and lower tail coverts yellowish white. The female is much less bright; the sides of the head and the back of the neck are gray, the top of the head and back being dusky margined with gray; the rufous mark-
nings of the breast and wings are very faint; the size is smaller. It is seen in Great Britain in large flocks in winter, with the chaffinch and allied species, disappearing toward the end of spring, going north to breed; it is hardy and bold, feeding on seeds and what it can pick up in the open fields; its flight is rapid and undulating; the note is like the “tweet” of the chaffinch repeated several times; according to Montague, it builds a nest in fir trees, and lays four or five yellowish spotted eggs. Albino’s of this species are occasionally seen. It is said to be very fond of beech mast.

The green finch (F. chloris, Linn.), also a European species, is about 6 in. long and 9 in. in length of wings; the bill is very stout, the tail short, and the body bulky, which characters have led Mr. Gould to consider it rather a grosbeak (coccothrautes) than a finch, and it is no doubt one of the intermediate forms between this and fringilla. The male is bright olive green above, passing into yellow; the quills blackish gray, with outer webs bright gamboge yellow; the tail, except the two middle feathers, which are gray with light yellow margins, are yellow like the wings, with the external edges grayish brown; below greenish, passing into sulphur yellow; the bill is white, with a pink tinge; the legs brown; the young are marked with oblong dashes of brown on the lower surface and the upper part of the back. This is an indigenous, non-migratory, hardy bird, living in flocks, familiar and docile; it is often kept in confinement for its facility in imitating the notes of other birds; its own song consists of three or four short mellow notes, which are very pleasing during the breeding season; it is not particular in its choice of food, eating the usual grains and seeds given to caged birds. The eggs are four or five in number, pale bluish white, speckled at the larger end with reddish brown.

The pine finch (F. pinus, Wils.; chryosomitra, Boie), distributed over North America from the Atlantic to the Pacific, is 4½ in. long, with an extent of wings of 8½ in. The plumage is soft, but with little gloss; the short, conical, acute bill is light yellowish brown, with a dusky tip; the iris brown; general color above yellowish gray, with dark brown streaks; the wings and tail dusky, with grayish white edges; the base of the secondaries, the tips of their covert, and the margins of the rump feathers are cream-colored; grayish white below, with streaks of dull brown, and a brown tinge on the fore neck; the female very closely resembles the male. This species, though seen in the southern states, prefers the northern regions of the country and the Canadas, wherever pine trees abound; it is most common in the north during winter, where it is seen in small flocks with the redpoll and the crossbill; the favorite food is found amid the branches of the highest fir trees, where they hang head downward like the titmouse; the seeds of the thistle and of the sweetgum are also much eaten by them. Though he could find no nests, Audubon met with great numbers of these birds accompanied by their young on the coast of Labrador toward the end of July; and they doubtless breed there. The mode of flight and notes resemble those of the goldfinch; like the latter, it sweeps through the air in long graceful curves, uttering its sweet and clear song as it takes a fresh start.

The genus passer (Brisa.) includes the sparrows of the old world, which are rarely called finches. The American sparrows are contained in the genus sonotrachia (Swains.); many of these are popularly called finches; the bill is perfectly conical, the wings moderate, the tail long, broad, and nearly even at the end. The grass finch (Z. graminea, Gmel.; genus puscetis, Baird) is 5½ in. long, with an extent of wing of 10 in.; the general color above is a light brown, streaked and mottled with darker; a narrow circle of white around the eye; throat and breast yellowish white, the latter streaked with dark brown; the larger coverts and the quills deep brown, the former edged with paler, and the first of the latter with white external margin; lesser coverts bay; tail deep brown, marked and margined with white; sides and abdomen pale yellowish brown, the former streaked with darker; under tail coverts white. It is distributed far to the north and over the United States from the Atlantic to the Pacific, and there is a variety, or perhaps a species, to the west of the Alleghanians; it seems to prefer sandy and barren soils in cultivated districts; its song is sweet and protracted; it is shy and solitary, and runs nimbly through the grass, in which the nest is built; the eggs, four to six in number, are laid about the middle of April at the south, where two broods are generally raised each year; they are seven or eight in number, pale bluish white, with reddish brown blotches; the food consists of various kinds of seeds and insects, and
the flesh is tender and of good flavor. This bird employs a great variety of artifices to deceive any one who approaches her nest, imitating lameness, and attempting to draw attention to another locality. Lincoln's finch (Z. Lincolnii, Aud.; melospiza, Baird) is yellowish brown above, with streaks of brownish black; head chestnut, streaked with brownish black; with a grayish blue band in the centre and two at the sides; quills and larger coverts deep brown with lighter margins, and the latter tipped with whitish; tail yellowish brown; throat white, with dusky streaks and spots; below grayish white. It is found as far north as Labrador, from the Atlantic to the Pacific, and south through Mexico to Guatemals. The song is very sweet and loud; the flight is rapid and low; the food is insects and berries; the males, as in most finches, are pugnacious.—The genus ammodromus (Swains.) has the wings short, the tail lengthened, the lateral feathers graduated, with the end of each acuminated; the species generally remain within the limits of tide water, and run along the shores among the weeds, like sandpipers, climb along the rushies, or swiftly dart among the tufts of grass; they eat shrimps, small mollusks and crustaceans, and other minute marine animals. The sharp-tailed finch (A. caudacutus, Gmel.) is found along the whole Atlantic coast of the United States, being most abundant among the salt marshes of South Carolina. The crown of the head is bluish gray in the middle, and deep brown at the sides, with a band of yellowish red from the bill over the eye; hind neck dull gray, tinged with brown; fore neck pale yellowish red with dusky streaks, the throat paler and unspotted; back brown, tinged with gray; primaries and tail wood brown; secondaries and smaller coverts reddish brown; sides yellowish red, with dusky streaks; breast and abdomen grayish white. They come down to the marshes when the tide is out, returning to the shores and rice fields at high tide; the note is a single "tweet;" the nest is placed on the ground, near the water, in a slight hollow; the eggs, four to six, are laid sometimes twice in a season; the color is dull white, with light brown dots, most numerous at the larger end; from the quickness with which they move on the ground, they are most easily shot on the wing. The seaside finch (A. maritimus, Wils.), with similar habits to the preceding, and found in the same localities as far north as Long Island, has the crown of the head deep brown, surrounded by a line of grayish blue; upper part of the back, wings, and tail, olive brown mixed with pale blue; lesser wing coverts reddish brown; a yellow streak from the bill over the eye; throat and fore neck grayish white; breast and sides grayish blue, the abdomen paler. The eggs are grayish white, with brown freckles all over; many nests are found in company. The food consists of marine insects, snails, crabs, sand beetles, and seeds.—Bachman's finch, placed in the genus ammodromus by Gray, belongs to the genus pseuca (Aud.); this (P. australis, Licht.) is reddish brown above, with the centre of the feathers black and their margins bluish gray; the quills dark brown with lighter edges; tail feathers brown, lighter on the outer edges; ochre-yellow streak over the eye; throat pale yellowish gray; fore part of the breast and sides tinged with brown, lower parts yellowish gray. The length of the bird is 6 in., and the extent of the short wings only 8. The habits of this species render it difficult to observe; it runs in the grass more like a mouse than a bird, and is much oftener heard than seen; the notes are soft and sweet, justifying the remark that it is perhaps the finest songster of the sparrow family. The food consists of grass seeds, beetles, and berries. It is confined to the southern states.—In the genus epiza (Bonn.), or cyanospiza (Baird), the wings and tail are moderate, and the latter even. The nonpareil or painted finch (S. ciria, Bonap.) is 6½ in. long and 7¼ in extent of wings; in the adult male, the head and neck are azure blue; the back and lesser wing coverts yellowish green; circle round the eye, lower back, and under
parts carmine; quills and tail purplish brown; secondary coverts green. The female has a brown bill, the upper parts light olive green, and the under parts dull orange-green, paler behind; the male of the first year resembles the female, except in having the blue lower mandible of his sex; the adult male plumage is not obtained until the fourth year. It is an inhabitant of the south Atlantic and gulf states, extending into Texas and Mexico; its flight is short and quick, and its movements on the ground like those of the sparrows; its song is very sonorous and pleasing, and is continued through the hottest part of the day; the nest is usually built in an orange tree, and the eggs, four or five, are of a fine bluish pearl color, speckled with blackish. It appears in the vicinity of New Orleans about the middle of April, when great numbers are taken in traps, set with a stuffed specimen of a male bird; all males which perceive this are led by their pugnacious disposition to attack it, and the trap springs upon them during the operation; they are easily kept in confinement, and will sing and breed in captivity if properly cared for. Great numbers of this beautiful finch were formerly carried to Europe, where they brought almost fabulous prices, a bird which cost eight cents in New Orleans selling in London or Paris for more than twice as many dollars. Their flocks sometimes occasion considerable damage to ripe figs and grapes, of which they are exceedingly fond. The lazuli finch (S. amaena, Bosc.,) is another handsome and allied species, belonging rather to the Pacific fauna. The bill is brownish black; the head and neck, bird part of back and rump, are beautiful greenish blue; fore part of the back, scapulars, wings, and tail, brownish black, the feathers with blue margins; a conspicuous white band on the wings; on the fore part of the breast a broad band of brownish red; the sides, lower wing coverts, and tibial feathers, bluish gray; lower parts white. The female is far less brilliant, a grayish tint prevailing in most parts of the plumage. It is rather a shy bird, with a lively and pleasing song. Another beautiful species is the S. cyanea (Bosc.), which will be noticed under Immoo Bird.—The last finch which will be mentioned belongs to the subfamily of pyrrhulinae, and to the genus Carpodacus (Kaup). The purple finch (C. purpureus, Gmel.) is 6 in. long, with an extent of wings of 9 in.; the bill is very robust, conical, bulging, and acute, deep brown above, bluish below; the head, neck, breast, back, and upper tail coverts are of a rich lake color, nearly crimson on the head and neck, and fading into rose color on the abdomen; the fore part of the back is streaked with brown; the quills, larger coverts, and tail are brown margined with red; a narrow cream-colored band across the forehead close to the bill. The female and young are brownish olive above, with dark brown streaks; the under parts grayish white, the sides streaked with brown; quills and tail feathers dark brown with olive margins; a broad white line over the eye, and another from the gape backward. In the southern states their flocks are seen from November to April, feeding on the interior of buds, which they husk with great...

skill; they are usually seen in the morning and at night, darting after insects. Their song is sweet and continued. They are found from Labrador to Louisiana, being replaced on the Pacific coast by the C. Californicus (Baird) and the C. Cassini (Baird); they breed in the north, where they are seen in midwinter in company with crossbills and other hardy birds, feeding on the berries of the evergreens. Their nests have been found in Massachusetts; the eggs are of an emerald-green color, with a few black dots and streaks near the point, and some purplish blotches. The farmers believe them to be injurious to fruit trees by destroying the blossoms, great numbers of which they pull off. Audubon considers their flesh equal to that of any small bird except the rice bunting. They are sometimes kept in cages and in aviaries, but they do not sing in confinement.

—Other sparrows and buntings are called finches in different parts of the country, though not belonging to the subfamily of fringilla, and may be found described among the fringillidae in works on ornithology.

FINCH, Henage, earl of Nottingham, a British statesman and jurist, born in Kent, Dec. 28, 1621, died in London, Dec. 18, 1682. He was educated at Westminster school and at Christchurch college, Oxford, subsequently studied law in the Inner Temple, and rose to great eminence as a lawyer. During the revolution he enjoyed general respect and confidence. At the restoration he was made solicitor general, took part in the prosecution of the regicides, of which he wrote a full account, and in 1661 entered parliament as member for the university of Oxford. In 1667 he defended
Lord Clarendon, when impeached for high crimes and misdemeanors. After being successively attorney general and lord keeper, he was appointed in 1675 lord high chancellor of England. In 1681 he was created earl of Nottingham, having for some years previous borne the title of Baron Finch of Daventry. He pursued a steady and consistent course in difficult times, and was distinguished not only for his legal erudition and soundness of judgment, but also for his eloquence and great powers of reasoning. He published various parliamentary speeches and legal arguments, and left in manuscript some volumes of chancery reports, and notes on Coke's Institutes.

FINDEN, William, an English engraver, born in London in 1787, died there, Sept. 20, 1852. He became noted at an early age as an engraver of book plates. Being remarkable for a certain neatness of line and smoothness of finish, his works were very popular, and he was selected to engrave Lawrence's celebrated portrait of George IV., for which he received 2,000 guineas. He also engraved the "Village Festival" and the "Highlander's Return," both from well known pictures by Wilkie. He published some very extensive series of engravings, the best of them the "Gallery of British Art" by which he lost heavily.

FINDING. The law of finding is, in some particulars, not quite settled. It is certain that nothing can be found that was not lost; hence, unless the owner of property has it no longer in his possession or within his reach, and is deprived of all power over it, either by accident or voluntarily, as when he casts it away, another man who happens upon it acquires none of the rights of a finder. Lost goods were defined by the old law as bona vacantia; and Savigny, in his "Treatise of Possession," says, § 18: Vacua est, quam nemo detinet. The ancient law of treasure trove was said to apply to gold and silver only; and indeed only to that which had been purposely hidden in the earth, and of which the owner was unknown. Originally it belonged to the finder; but many centuries ago it was adjudged to belong, to a greater or less extent, to the sovereign, and Grotius says this rule had become in his time jus commune, quaest gentium. Blackstone ("Commentaries," vol. i., p. 296) makes a distinction between goods hidden by the owner, which the owner never claimed, being prevented by death, forgetting, or neglect, and goods voluntarily or accidentally cast abroad. In the first case there was no intention to abandon them, and when they were not the owner's they became the king's, to whom the finder must give them. In the latter case they became the property of the finder. The law of treasure trove never had much force in this country; and although there were formerly some colonial regulations and there are some modern statutes in respect to finding, they do not appear to have much force, unless it be in relation to what may be termed wrecks. The law on this subject, so far as it can be gathered from the authorities, seems to be this: 1. The finder of lost property is owner of it against all the world excepting the original owner; but the owner may reclaim it from the finder at any time, although leaving it unclaimed in the finder's hands for a sufficient length of time after the owner knew where it was and could claim it (perhaps 20 years, the ordinary period of prescription, might be necessary), would be equivalent to a waiver or abandonment of his ownership. The finder has therefore all the rights of action of an owner, either to recover possession of it, or damages for loss of it or injury to it. 2. The finder is always at liberty to leave what he finds untouched, and cannot be made accountable for any injury thereafter happening to it. But if he takes it into his possession, he acquires some rights and comes under some obligations which do not seem to be perfectly well defined. On the one hand, it is said by the old authorities, that if the thing found perish by his mere neglect, or without his active aid, he is not responsible. But the tendency of modern law is, that while he may abstain if he pleases from any interference whatever, if he chooses to take what he finds into his custody, he makes himself responsible not only for any wilful injury to it (which is quite certain), but for the consequences of his gross negligence. 3. As the correlative rule, or as the right which corresponds to this obligation, he may demand from the owner all his expenses necessarily incurred in keeping and preserving the property, and probably his reasonable expense in the way of advertising, or for similar charges for the benefit of the owner. We should say that where a finder takes into his possession the thing found, it becomes a kind of bailment; and the owner, by reclaiming and receiving it from the finder, as- sents as it were to this bailment; and out of this constructive bailment grow the obligation and responsibility of the finder on the one hand, and his rights on the other. 4. It has been intimated by one high authority, at least, Judge Story ("Bailment," sections 85 et seq.), that the finder may also make a further charge against the owner for compensation for care and labor, and perhaps for reward. There are moral reasons for this, but no legal authority; and except when property is found at sea, and comes under the admiralty law of salvage, we know no law which authorizes the finder to claim more than his expenses. 5. For whatever the finder may lawfully demand of the owner in respect to the property found, he has, we think, as one of the consequences of the constructive bailment above spoken of, a lien on the property itself; that is, a right to hold it even against the owner until his demand is satisfied. 6. It seems now to be settled that the price whereafter the thing found has no effect upon the rights of the finder. Thus if A finds money on the floor of B's
store, and hands it to B for the owner, and B advertises, and does what else he should to discover the owner, and fails in this, the finder may demand it of B, tendering B's expenses in discharge of his lien. There was at one time some disposition to say that if A found goods buried in B's lands, they were the property of B; but this seems to have passed away, or rather never to have been settled law, and the rule above stated, that the place where found has no effect whatever on the right of the finder, is without qualification. 7. If a reward be offered, which is specific and certain, or can be made so by reference to a certain standard, the finder by bringing the thing found to the owner, or otherwise complying with the terms of the advertisement, becomes a party to a contract offered to all by the advertiser, and may sue for the compensation or reward promised. But if the advertisement is general only, as that the finder shall be liberally rewarded, the finder has no specific claim, and can have no action. 8. The rule that the finder is owner against all the world except the original owner has one important exception. A finder of what the law calls a chos in action, or mere evidence of debt or claim, cannot demand payment of it; and if one should pay a note, a check, or a lottery ticket, to a holder known by the payer to have come into possession of it by finding, the payer would be bound to pay the amount to the owner who could prove his property. 9. A finder may incur punishment as for crime, by misconduct about the property he finds. Thus, if he knows the owner, or there are circumstances which, if he chose to profit by them, would lead him to the owner, a conversion of the property to his own use is larceny or theft. But it is not larceny unless the animus furandi existed at the time of the appropriation; for if the finder only discovered the owner after he had made the appropriation, and then concealed his finding, it would seem to be the law that he is answerable only in damages.

FINDS, a term recently applied by English archaeologists to deposits of objects connected with human life, and sometimes associated with human remains, but of prehistoric or unknown origin. The chief aim of scientific research in regard to them is to ascertain the historical relation and condition of the human beings which they represent. As the development of civilization is not a uniform process, the discovery of a few objects made and used by a prehistoric tribe is not a sufficient index to the exact place of that tribe in history. Within certain limits there is a real consistency in stages of civilization; but in the present state of prehistoric archæology it is hardly possible to make a classification which would correctly represent the sequence of forms and materials. The antiquaries of Denmark, a country especially rich in relics, classified their finds according to some leading features that seemed to indicate a regular sequence. They conclu-

ded that there had been an age when men used only implements of stone and bone, and were ignorant of the use of metals; that an age had succeeded when the use of bronze was known, and probably that of gold; and that there was a third age, when iron hadsuperseded other metals for weapons and utensils. All the finds were consequently classified according to these three ages. It proved, however, that such exact lines could not be maintained. Men did not immediately cease to use stone implements when bronze was introduced; and bronze continued to be employed after the use of iron was well known. Another mode of classification is followed in France, where the finds are generally arranged in the museums after the following order:

1. Epoch of extinct animals.
2. Epoch of migrated existing animals.
3. Epoch of domesticated existing animals.

Metal Ages.

1. The bronze epoch.
2. The iron epoch.

This classification, suggested by the archaeologist Lartet, best serves our purpose of making a rapid survey and furnishing a short description of the objects found in ancient habitations of both hemispheres. For the various theories in relation to these finds, as well as for the nature of the places where they have been discovered, see American Antiquities, Archæology, Bone Caves, and Lake Dwellings.

Stone Age. Finds of objects classified as belonging to the first epoch of the stone age have been made principally in the caverns of Aurignac, in the hills of Pajoles, the Trou de la Fontaine, the cave of Sainte-Reine, the grotte des Fées at Arcy, the caves of Vergisson, Vallières, La Chaise, Gorge d'Enfer, Moustier, Pey de l'Azié, of Périgord, and of the department of Ariège, in France; in Kent's cave, Brixham, Gower, Kirkdale, and Wells, in England; in the caves of Chiampo and Laglio near Lake Como, of Palermo, San Ciro, and Macagnone, in Italy and Sicily; in a few caves in Spain, Algeria, Egypt, and Syria; in caves near the lake of Sumidouro in Brazil; and especially in Belgium, as near Liège, at Engls, Enghoul, and Nauliée. In these caverns, and sometimes also on the surface of the ground or buried in it, have been found large quantities of chipped flints, arrowheads, and various stone implements, to all of which archaeologists usually give the common name of hatchets. The commonest of the worked flints is the almond-shaped type. These instruments are oval hatchets, carefully chipped all over the surface so as to form a cutting edge. The Mouster type is a pointed flint wrought on one side, the other being entirely plain. The third type is that of knives; they are thin and narrow tongue-shaped flakes, with one of the ends chipped to a point, and were used as scrapers. Others were wrought so as to do service as augers. Near Amiens were discovered small globular bodies with a hole through the middle, which are believed to be
fossil shells used for adornment. There are many articles in the deposits of the quaternary epoch whose intention or significance is not known. Some are believed to have been religious symbols and emblems of authority. The natural color of all the wrought flints that belong to the earliest epoch of man’s existence is gray, from the brightest to the darkest tint; but argillaceous soils color them white, and ochreous gravels yellowish brown. The proof of their age is the patina, which is the established term for those which are white on one side and brown on the other, probably from having lain between two different beds. To guard against fraud and to detect modern imitations of ancient stone implements, it is well to notice whether the flints are coated with branching crystallizations, called dendrites, of a dark brown, produced by the combined action of the oxides of iron and manganese generally contained in fossiliferous beds.—The finds which are assigned to the second division of the stone age, the epoch of the reindeer or of migrated existing animals, consist of flints which bear marks of more skilful workmanship, and implements in bone, ivory, and reindeer horn, not found in caves where human bones were mixed up with those of animals. Little splinters of bone, one or two inches long, straight, slender, and pointed at both ends, have been found among the deposits of Bruniquel and the Dordogne valley, and are believed to have served as fish hooks during this epoch. Numerous instruments have been found which must have been used as needles, as they are exactly like those now employed by the Lapps for the same purpose. Prof. Owen thinks the men of this period were anthropophagists, because human skulls have been found mixed up with sculptured flints, remains of pottery, and children’s bones on which there seem to be traces of human teeth. To this period are also assigned the polishers, formed of sandstone or some other material with a rough surface; they were used for polishing bone and horn. Other objects classified as belonging to this age are barbed dartheads or harpoons; small flint saws, fine-toothed and double-edged; bone bodkins or stilletes, either with or without a handle; smoothers, probably intended to flatten down the seams in the skins used for garments; flint points with a cutting edge, probably used as drills; whistles made from the first joint of the foot of a reindeer; staves of horn, which were perhaps symbols of authority; earthen vases and urns, which at the bottom bear traces of the action of fire; and first attempts at art, as sketches of mammoths graven on slabs of ivory, hilts of daggers carved in the shape of a reindeer, and representations of bisons, stages, and unknown herbivorous animals. The most important places where finds of such articles have been made are the grottoes and caves near Fontainebleau, near to Nantes; a cave on a mountain near Geneva; the bottom of an ancient glacier moraine not far from the lake of Constance; the caverns at Solutré, Bourdeilles, Laugerie-Basse and Laugerie-Haute, Abbeville, Les Eyzies, Chaffant, La Madeleine, Lavache, and Bruniquel, in France; the cave of Chalenx, the settlements on the banks of the Lesse, the cave near Turfou, in Belgium; and the gravel beds of Colorado and Wyoming, the loess of the lower Mississippi valley, and the Osage and Bourbeuse valleys, in North America.—The third epoch of the stone age, with domesticated animals of existing species, which is also designated as the polished stone epoch, is believed to embrace the finds made in the kjeokken-moeddings (Dan. kjeokker, kitchen; moedding, heap of refuse), or kitchen middens, principally in Scandinavia, but also discovered in Cornwall and Devonshire, England, in Scotland, and near Hyères, at St. Va- lery, department of Pas-de-Calais, at La Salle, and at Cronquelets, in France. Darwin met with them in Tierra del Fuego; Dampier in Australia; Pereira da Costa on the coast of Portugal; Lyell on the coasts of Massachusetts and Georgia; and Strobel on the coast of Bra- zil. Numerous finds assigned to this epoch have also been made in the caves of Old Castle and the provinces of Seville and Badajoz in Spain, in the neighborhood of Civitá Nuova in S. Italy, and in the island of Elba. Polished stone implements have also been found in Wurttemberg, Hungary, Poland, and Russia. Le- guay found in 1860 near Varenne-Saint-Hilaire, at a spot called La Pierre au Prêtre, a complete polishing stone, having on its surface three depressions of different sizes, two well defined grooves, and one merely sketched out. The polishing of stone instruments was effected by rubbing the object in one of these cavities, in which probably a little water was poured, mixed with zircon or corundum powder, or perhaps merely with oxide of iron, which is still used by Jewellers for the same purpose. Finds of numerous hatchets and other polished instruments, near the fragments of several polishing stones, have given rise to the supposition that at this epoch there were regular workshops in which weapons and implements were manufactured. In the kitchen middens were found flat hatchets, cut squarely at the edge; drilled hatchets variously combined with a hammer; double-edged axes and axe hammer, pierced with a round hole in which the handle was fixed; beautiful spear heads in the shape of a laurel leaf, flat, and chipped all over with great art, which were evidently fixed to staves; poinards with handles sometimes covered with delicate carving; arrowheads of various shapes; chisels somewhat in the form of a quadrangular prism; small stone saws, in the shape of a crescent of which the inner edge, which was either straight or concave, was skilfully serra- ted; and various ornaments, as necklaces made of small pieces of amber, perforated and strung. The ideas of the men of this epoch, who lived in the valley of the Somme are also considered as belonging to this epoch. Particularly interest-
ing relics are the pieces of polished flint half buried in a kind of sheath of stag's horn. The middle of the sheath is generally perforated with a round or oval hole, probably intended to receive a wooden handle. Sheaths have also been found which are not only provided with boars' tusks, but are hollowed out at each end so as to hold two flint hatchets at once. In the peat bogs of Abbéville have been discovered long bones belonging to mammoths, as the tibia, femur, radius, and ulna, all cut in a uniform way either in the middle or at the ends, which were probably used as handles for flint implements. Near Pequotny were found 19 boars' tusks split into halves, perfectly polished, and perforated at each end with a round hole. Through these holes was passed a string of some tenacious substance, the remains of which, it is said, were actually seen at the time of the discovery. In the caves of Ariège were found more than 20 stones which could only have been used for grinding corn. According to John Buchanam, quoted in Lyell's "Antiquity of Man," the canoes which were found in the low ground on the margin of the Clyde at Glasgow, as well as other boats found at the bottom of the Swiss lakes, and in Belgium and France, were formed of a single trunk of oak, hollowed out with some blunt instruments, probably stone hatchets, assisted by the action of fire; for which reasons it is believed that these finds must also be classified as belonging to this epoch of the stone age. Finds of stone implements similar to those described have been made in the vicinity of Alton, Illinois; Jackson, Laporte, Sullivan, and Crawford counties, Indiana; in a shell heap on the bank of the Grand lake, Louisiana; in Paris, Wisconsin; and a few in Kentucky. -- *Metallic Age.* The principal places of deposit of articles assigned to the bronze epoch of the age of metals are the lacustrine habitations of Switzerland and other parts of Europe, and the palustrine villages of northern Europe. Survivals of the implements belonging to this epoch have also been made in other prehistoric human habitations, and in tombs, in Scandinavia, the British isles, France, Switzerland, and Italy. The Danish bronze swords had hilts firmly fixed to the blade by means of two or more rivets, and some of them were splendidly ornamented. A bronze knife has been found with a handle in the form of a human figure executed with much fidelity. Several razors have been discovered, of which the blades were overloaded with ornaments. A very important find was made in 1851 in a tumulus in Jutland, of three wooden coffins, closed with movable lids, each of which contained a woollen cloak, a shawl, and a cap, and at the feet of the body two pieces of woollen material which seemed to be the remains of a garment; each also held a sword, a knife, a bodkin, an iron pin, a pair of tweezers, a double button, a ball of amber, and a flint spear head. The shape of the sword and the knife indicates that the deposit belongs to the latter part of the bronze epoch. Various objects found in dwellings belonging to this epoch appear to have been religious symbols. Most of them have a shape bearing some relation to a circle, and many authors have attributed them to the worship of the sun. Crosses belonging to this and even to the stone age are also sometimes met with. The figure of a triangle found on various objects in bronze is also believed to bear some relation to certain religious ideas. For the finds made in North America another epoch, of a special character, has to be presumed. In 1847 Mr. Knapp discovered in the Ontonagon region on Lake Michigan, under an accumulation of earth, a vein of native copper, containing a great number of stone hammers. One of the diggings brought to light some great diorite hatchets which were worked by the aid of a handle, and also large cylindrical masses of the same substance hollowed out to receive a handle. Copper wrought into various utensils is found in the mounds all the way from Wisconsin to the gulf coast. Squier and Davis discovered in a mound near Chillicothe several round shells of mica 10 or 18 in. in diameter, overlapping like the scales of a fish. A find of 250 mica plates was made in the Grave creek mound. Many of the implements of these mound builders of the age of copper seem to have been wrought also of a ribbon-marked silicious stone. Squier and Davis found a deposit of obsidian arrowheads in Ohio, and Mr. Perkins one in Wisconsin. -- *The Iron Epoch.* The finds assigned to this epoch consist of instruments of iron or bronze, or of iron combined with bronze instead of stone, articles of silver and lead, specimens of improved pottery, and coins. The most valuable finds have been made in the vast burial ground recently discovered at Hallstadt, near Salzburg, in Austria. The swords found there have iron blades and bronze hilts. The warriors' sword belts are generally formed of plates of bronze, and embossed with a repoussé pattern; in some instances the belt was made in the form of a hammer. Several necklaces with pendants, and hundreds of bracelets, hair pins, and bronze fibulae, all wrought with taste, have also been found here. Nearly 200 bronze vessels have been discovered, some of which are 86 in. high. Some of these vessels were carefully riveted, but not soldered. A find of glass vessels was also made in the same place, and remains of pottery were abundant. The ivory objects found were heads of hair pins and pommels of swords. The helmets resemble those worn by Gallic soldiers. In the tombs on the plateau of La Somma, in Lombardy, were found vases of fine clay, evidently wrought on the potter's wheel, ornamented with various designs, and containing ashes. Near Bern, at a spot called "the battle field of Tienen," because it appears to have been the theatre of a great conflict between the Helvetians and the Gauls, a find was made of about 100 swords and spear heads, fragments of coats of mail, rings, fibulae, tires of chariot wheels, horses' bits, and
coins in gold, silver, and bronze. The only agricultural implements found in places of de-
posit of an undoubted prehistoric date, are scythes and sickles, and a mill composed of two
stones resembling somewhat the pistrinum of the Romans. No implement of iron has been
found in connection with the ancient civilizations of America. The mound builders appear
to have wrought the rich specular ores of Mis-
souri in the same manner as stone.—Prehis-
toric Monuments. Ferguson, in “Rude Stone
Monuments,” places little confidence in the
classifications hitherto followed as a basis for
establishing any historical relation with the
human beings who used the objects discovered,
or even for determining who they were. He
proposes to classify finds according to the char-
acter of the places where they are made, and es-
specially the degree of art exhibited in the struc-
ture of the prehistoric sepulchres from which
nearly all the antiquarian objects have been
taken. He maintains that the peculiarities of
the mode of honoring the dead distinguish the
races of mankind as definitely as speech. He
classifies prehistoric sepulture as follows: I.
Tumuli. a. Barrows of earth only. b. With
small stone chambers or cists (microlithic).
c. With chambers or dolmens formed of large
stones (megalithic). d. With external access to
chambers. II. Dolmens. a. Free standing dol-
mens without tumuli. b. Dolmens on the outside
of tumuli. III. Circles. a. Circles surrounding
tumuli. b. Circles surrounding dolmens. c. Cir-
cles without tumuli or dolmens. IV. Avenues.
a. Avenues attached to circles. b. Avenues
with or without circles or dolmens. V. Men-
hirs. a. Single or in groups. b. With oghams,
sculptures, or runes. The earliest mode was
simple imnination, and if the deceased was of
some importance a mound was raised over the
grave. A sort of coffin was probably next de-
vised, as seen in the rude cists so commonly
found. In wooded countries the coffin was of
wood, and, if the mound is old, perished long
ago. Cists were expanded into chambers, to
which at a later age passages for access were
made. From the chambered tumulus sprung elaborate domed structures of either mega-
lithic or microlithic architecture. The history
of megalithic remains begins with the rude
stone cists, generally called kistvaen, which
by degrees became magnified into chambers,
the side stones increasing from 1 ft. in height
to 5 ft., and the capstone becoming a really
megalithic feature, 6 to 10 ft. long by 4 or 5
ft. wide, and of considerable thickness. Many
antiquaries insist, however, that all the dolmens
(Celtic, dauil, a table, and men or maen, a stone)
or cromlechs (Celtic, crum or Crom, crooked or
curved, and lech, a stone) which are now stand-
ing free were once covered and buried in tu-
muli. The stone circles appear to have been
introduced as substitutes for the circular
earthen mounds which surround the early
tumuli. They frequently enclose also dolmens,
either standing on the level plain or on tumuli;
but they are often found enclosing nothing that
can be seen above ground. It is believed that
the larger circles, more than 100 ft. in diameter,
were not sepulchral, but cenotaphic, or temples
dedicated to the honor or worship of the dead.
The avenues are rows of stones, sometimes
leading to circles, and are also designated as
alignments or parallelitha. Those of the first
class represent externally the passages in tu-
muli which lead to the central chamber, but it
is difficult to divine the use of the avenues
which are not attached to circles and do not lead
to any important monuments. The men-
hirs, or tall stones (Celtic, men, stone, and
hir, high), are stone pillars, with or without
inscriptions, which gradually superseded the
earthen tumuli as a record of the dead.—Of
the conclusion that may be drawn from the
character of finds in regard to the culture of
the contemporary races, E. B. Tylor says:
“*The exclusive use of stone, bone, &c., for
cutting and piercing implements, is in general
a criterion of savage culture, though compat-
ible with the settled and comparatively ad-
vanced state of the early Swiss lake dwellers.
2. Bronze-making indicates a more advanced
and systematic civilization, up to the level of
the Mexicans and Peruvians in modern, and the
Aryan races in ancient times. 3. Iron-making
is indispensable to high culture, but from the
facility of its adoption is not of itself a proof
of anything beyond a high savage state affected
by intercourse with still higher conditions.”—
Human Remains. These have been found in
surprisingly small numbers. Lyell explains
their scarcity as the effect of nature’s plan of
disencumbering habitable areas of skele-
tons by means of “the heat and moisture
of the sun and atmosphere, the dissolving
power of carbonic and other acids, the grind-
ing teeth and gastric juices of quadrupeds,
birds, reptiles, and fish, and the agency of
many of the invertebrata.” The human re-
 mains remain regarded by eminent archaeologists
and osteologists as the oldest so far discovered are
the fragments of the skeleton found in the
Neandertal cavern, near Dusseldorf, Ger-
many; the fragments of a skull from Brux,
Bohemia; similar fragments of the Engis cave
near Liége, Belgium; and the skeletons from a
tumulus at Borreby, Denmark. The Neander-
thal skull resembles that of Brux, but is so
different in appearance from that of Engis, that according to Huxley it might be
supposed to belong to a distant race of man-
kind. Schaaffhausen and Busk speak of it as
the most brutal of all known human skulls,
and as greatly resembling those of apes. One
of the Borreby skulls has also this resemblance,
but the others are said to exhibit a much higher
conformation. The Engis skull is deemed
a near approach to the Caucasian type, and ap-
pears to possess at the same time a more de-
cided claim to antiquity than that of the Ne-
anderthal. The Borreby skulls belong to the
stone period of Denmark, and the people to
whom they appertained were probably either contemporaneous with or later than the makers of the kitchen middens. The Engis skull was found in one of the numerous bone caves which border the valley of the Meuse, where the remains of a number of human individuals were discovered, mingled with the bones and teeth of extinct quadrupeds, and with rude stone implements. Dupont in 1864 excavated 43 other caves in the valleys of the Lesse and the Meuse, and discovered in 25 of them numerous human remains, which he has divided into the mammoth, the reindeer, and the neolithic or polished stone period. Schaaffhausen, in his exhaustive treatise "Ueber die Urform des menschlichen Schädel" (Bonn, 1868), argues that the individual to whom the Neanderthal skull belonged must have had a small cerebral development, and uncommon strength of corporeal frame. One of the chief objects of the investigations as to the age of these remains is to determine whether man is preglacial or post-glacial. There is some reason for believing him to be pre-glacial, but not older than the later half of the pliocene period. In 1863 Deenoyers found near St. Prest fossil bones which some consider as coexistent with the *elephas meridionalis*, while others regard them as comparatively modern. The genuineness of the fossil man of Denise, found in central France, and alleged to have been contemporary with the same extinct animal, is questioned. The human bone of Natchez, Mississippi, which was accompanied by bones of the mastodon and megahy, is supported by insufficient scientific testimony; and the human remains in the loess near Maastricht, and near Strasburg, are assigned but hesitatingly to any very remote period of antiquity. The human remains found in the caves of Languedoc associated with bones of extinct mammals, and those discovered in March, 1872, by Dr. Rivière in a cave at Mentone, near Nice, may be safely considered as belonging to the postpliocene period. The antiquity of the human bones in Belgium, as Dupont has shown in his work *Les temps antéhistoriques en Belgique* (Brussels, 1871), can also be accepted as dating from times anterior to the neolithic age. Count Fourtale found human remains on the shores of Lake Monroe, in Florida, but as yet no date can be positively assigned to them. Many hypotheses have been put forward on the presumptive migrations of the prehistoric races; but in the present state of our knowledge no satisfactory conclusion can be reached. Quatrefages considers the pre-Aryan races which are typified by the human remains in the caverns of France as belonging to the Finnish family; Schaaffhausen is very decided in associating them with the Celts; Schmerling speculates on Ethiopian affinities; and Huxley sees many analogies between these ancient inhabitants of Europe and the form, condition, and habits of the Australian races.—Besides the works referred to above and in the articles on American Antiquities, Archaeology, Bone Caves, and Lake Dwellings, see Offer, *Lydische Königgräber* (Berlin, 1859); Lindenschmit, *Die Allerthümer unserer heidnischen Vorfahren* (1863 et seq.); Lartet, *Costumes du Périgord, objets gravés et sculptés des temps préhistoriques dans l'Europe occidentale* (Paris, 1864); Don Gonzaga y Martinez, *Antigüedades prehistóricas* (Madrid, 1868); Figgier, "Primitive Man" (1870); Virchow, *Die altnordeische Schädel in Kopenhagen* (Berlin, 1871); Ferguson, "Rude Stone Monuments of all Ages" (London, 1872); Evans, "Ancient Stone Implements" (London, 1872); Foster, "Prehistoric Races of the United States" (Chicago, 1873); and Rivière, *Découverte d'un squelette humain de l'époque paléolithique* (Paris, 1873).

**FINGAL'S CAVE**, a grotto on the S. W. coast of the islet of Staffa, Argyllshire, Scotland, 7 m. off the W. coast of Mull, probably called after Fingal, the legendary hero of Gaelic poe-
FINISTÈRE, or Finistère (Lat. finis terræ land's end), the extreme W. department of France, in Brittany, surrounded on three sides by the ocean and the English channel, and bounded E. by the departments of Côtes-du-Nord and Morbihan; area, 3,595 sq. m.; pop. in 1872, 642,698. The coasts, generally steep and deeply indented, are about 400 m. in length, and present many excellent bays and harbors. The most important ports are Brest, Morlaix, Landerneau, Quimper, and Douarnenez. Of numerous rivers only the Anse, the Ebron, and the Odet are navigable. Two hill chains, that of Arès in the north and that of the Black mountains in the south, run through this department E. and W. The climate is mild, but humid; fogs are common; W. winds are most prevalent, and violent storms often occur. The soil of some parts is good, and the pasturage is excellent; but heath or waste land covers no less than a third of the area, and agriculture is in a backward state. The wealth of the department consists especially in its mines of argentiferous lead; those of Poullaouen and Huelgoat are perhaps the largest in France. Iron, zinc, coal, and bitumen are also mined. The fisheries are very important. There are manufactories of linen and woollen fabrics, paper mills, rope yards, and sailcloth and earthenware factories. The department is divided into the arrondissements of Quimper, Brest, Morlaix, Châteaulin, and Quimperlé. Capital, Quimper.

FINK, or Finck, Friedrich August von, a Prussian soldier, born at Strelitz in 1718, died in Copenhagen, Feb. 24, 1786. He had gained experience in the Austrian and Russian service previous to entering the Prussian army as major in 1748. He was advanced by Frederick the Great to the rank of lieutenant general, and was employed in 1759 to cooperate with the king's brother in Saxony, the chief command being subsequently intrusted to him. After the capitulation of Dresden to the Austrians (Sept. 4), Fink was ordered by the king to Maxen to cut off the enemy's retreat, but was surrounded and overwhelmed by vastly superior forces, and obliged to surrender (Nov. 20). On his return from Austrian captivity he was court-martialled, and, though he had anticipated the Maxen disaster by representing to the king the inadequacy of his resources, was sentenced to a year's imprisonment in the fortress of Spandau.

After his release he begged to be dismissed from the Russian service, and in 1764 became general of infantry in the Danish army. But he felt wronged by the Prussian king's inexorable rigor, and died broken-hearted.

FINLAND (Fin. Suomessa, region of lakes), a grand duchy in the northwest of the Russian empire, lying between lat. 59° 45' and 70° N., and long. 30° 50' and 33° 56' E., bounded N. by the Norwegian province of Tromsö, E. by the Russian provinces of Archangels and Olonetz, S. by the Gulf of Finland, and W. by the Gulf of Bothnia and Sweden; area, 184,880 sq. m. The name of Finland was given to it by the Swedes. The kings or governments and their population in 1867 were as follows:

The population comprises 125,000 Swedish Finns, 8,000 Russians, 1,000 Lapps, 1,000 gypsies, and 400 Germans, the rest being Finns proper. In December, 1870, the population amounted to only 1,793,621, showing a considerable decrease since 1867; as in several years, in consequence of famine and epidemics, the number of deaths largely exceeded that of births. There are 34 towns with an aggregate population of 125,000, constituting only 7.5 per cent. of the total population, a smaller percentage than is found in any other country of Europe. The most populous districts are along the coast; there are some tracts in the interior wholly uninhabited. The population of the whole country is about 13.7 to the square mile.

The S. coast of Finland is bordered by rocky inlets, between which and the mainland are narrow and intricate channels difficult of navigation. The W. coast is generally low, but becomes very rocky near the Quarken, and in some parts is not less dangerous than the southern. Some of the islands, as those of Sveaborg, which command the entrance to the harbor of Helsingfors, are strongly fortified. The rivers are few and unimportant; the principal is the Kummene, which flows into the gulf of Finland, and is broad and deep, but owing to cataracts is not navigable. The lakes, however, constitute a prominent feature in the geography of the country, being very numerous and occupying a large proportion of the territory. Independently of Lake Ladoga, which lies partly in Finland, the largest of these sheets of water are Lakes Saima and Ena. The communication between the various watersheds and the Finnish gulf has been established since 1854 by the lake of Saima. The surface is table land from 400 to 600 ft. above the level of the sea, with occasional higher elevations. The Mann Selkä mountains, which with their
various branches traverse the north, rise to an altitude of about 2,400 ft. The principal geological formation is red granite with hard limestone and slate. The granite is soft and readily disintegrates. The soil is poor and stony, but long furnished considerably more grain than was required for home consumption. The climate is more severe than that of Sweden, although resembling it in many other respects. Dense fogs are frequent, and the rains in autumn are very heavy. In the southern provinces the winter lasts seven months. In the northern the sun disappears in December, and is not seen again until the middle of January; but during the short summer it is almost continually above the horizon.—The mineral products comprise bog iron, lead, sulphur, arsenic, and a little copper ore. Salt is very scarce, and is one of the principal articles of importation. The entire mineral produce of the country was in 1870 valued at $1,169,245. Among the animals are the bear, wolf, elk, deer, beaver, molecat, and various kinds of game. Large herds of reindeer are domesticated in the north, and cattle breeding is a prominent branch of industry. Seals and herring are caught off the coasts, and the lakes and streams abound in salmon and a small species of herring which form an important part of the food of the inhabitants. Finland was formerly called the granary of Sweden; but since the Russian conquest agricultural production is said to have declined. The chief crops are barley, rye, oats, flax, oats, leguminous plants, and potatoes. A little tobacco, carrots, celery, parsnips, and onions are also grown. Wild berries are almost the only fruit. The forests are extensive, reaching N. to lat. 69°, consisting principally of pine and fir, but containing also beech, elm, oak, poplar, ash, and birch. These forests are one of the chief sources of national wealth, but have been much wasted by a system of manuring land with their ashes. The soil requires frequent stimulus, and when the cleared land ceases to produce sufficiently it is abandoned for other portions of soil, the timber of which is purposely burned. Much tar, pitch, and potash, however, as well as firewood, are still exported. The pasture lands are good, but ill managed.—Manufactures are chiefly domestic. The peasant prepares his own oat, tar, pitch, and charcoal, builds his own boat, makes his own chairs and tables, and in his cottage are woven the coarse woollen and other fabrics of which his dress is composed. But there are several cotton manufactories. In 1865 there were in Finland 23 manufactories of tobacco, 19 of glassware, 7 of paper, and various others. The aggregate produce of the Finnish manufactories in 1865 was valued at $2,962,880; the number of workmen employed was 6,946. The exports of Finland amounted in 1870 to $8,514,720 ($3,300,000 to Russia), and the imports to $7,846,460 ($2,769,690 from Russia). The chief articles of export were timber and wooden ware, butter, iron, corn, tar, and fish; the chief imports were coffee, iron, sugar, raw cotton, salt, tobacco, wine, and brandy. Of foreign countries, England ranks first as regards the exports of Finland, and Germany first as regards its imports. Finland has two banks: one national bank, Finland Bank, established in 1811, and administered since 1868 by deputes of the diet; and one private, Föreningbanken i Finland, founded in 1822, which in 1870 had branches in 17 towns. The commercial marine consisted in 1870 of 76 steamships and 504 sailing vessels, of 81,352 tons, manned by 5,743 sailors. The largest number of commercial vessels is owned by the town of Brahestad; next in order follow Abo, Nystad, Vasa, Uleaborg, and Jakobstad. Not included in the above number are 1,109 coal vessels, of 52,064 tons. There is regular steamship connection all along the coast from St. Petersburg to Tornes, as well as on most of the lakes in the interior of the country. There are 14 lighthouses and 740 pilots distributed among 97 stations. The first railway was opened in 1862 between Helsingfors and Tavastehus; in 1870 the railway between St. Petersburg and Helsingfors was completed, and in 1874 that between the former city and Hango. The entire length of the Finnish railways in 1871 was 296 m., of telegraph lines 1,606 m., and of telegraph wires 2,758 m. In 1869 a submarine telegraph was laid between Sweden and Finland, via the Åland islands.—With the exception of 41,000 Greek and 800 Roman Catholics, nearly the whole population are Lutherans, divided into three dioceses. The archbishop resides at Abo, the two bishops at Borga and Kuopio. Education receives considerable care, and the study of the Finnish language, which was much neglected while the country was subject to Sweden, is encouraged by the Russian government. Besides the Alexander university, transferred from Abo to Helsingfors, there are six gymnasia, 13 superior elementary schools, and a military academy, and most of the parishes have primary schools. In 1864 a Finnish normal school was established at Jyväskylä; and in 1871 the establishment of two Swedish normal schools, one male and one female, was ordered. In 1872 the study of the Russian language in all state schools was made compulsory; up to that time it had been optional, and, from the aversion of the Finns to all that is Russian, generally neglected.—Since 1809 Finland has been united with the empire of Russia. Its fundamental laws are the Swedish constitution of 1772, and the act of union of 1789. These were confirmed by the emperor Alexander I., March 27, 1809; again by the emperor Nicholas, Dec. 24, 1825; and by Alexander II., March 4, 1855. The right of representation was regulated anew by a law in 1869. The government is administered by a governor general and a senate consisting of 14 members, half of whom are noble, and who are presided over by the governor general assisted by two vice presi-
students not included in the number of the members. The senators are named for three years by the emperor. The vice presidents are chiefs of the departments of justice and finance. The deliberations of the senate are held at Helsingfors, the modern capital. High courts of justice sit at Abo, Vasa, and Viborg. There is also a regular military court. Provincial governors reside at Helsingfors, Abo, Tavastehus, Viborg, St. Michael, Kuopio, Vasa, and Uleabor. These dignitaries are all, by the terms of the constitution, Finns, and a secretary of state for Finnish affairs resides at St. Petersburg, and is a member of the imperial council. A diet, composed like the former diet of Sweden of the four orders, nobility, clergy, burghers, and peasants, is a constitutional privilege of Finland, according to the imperial recognition. The troops of the army as well as of the navy consist of men who can volunteer for a term of six years. In 1872 Finland had only a battalion of sharpshooters, consisting of 679 men; the marine troops numbered 100 men. The revenue in the general budget for 1871 amounted to $3,058,370, of which $368,440 were from real estate, $1,323,092 from customs, stamps, &c., $500,166 from casual dues, and $240,000 from tax on brands, &c. The expenditures amounted to $2,786,499, of which $575,076 were for the civil administration, $295,440 for government, $475,837 for agriculture and commerce, and $512,110 for extraordinary expenditures. The revenue and the expenditure of the military budget amounted to $492,738 each. The clergy, part of the troops, and various civil functionaries receive their emoluments and pay from resources not included in the foregoing list of revenue; namely, from country parishes, or from government lands reserved for this purpose. These expenditures therefore do not appear in the general budget. The debt of the state in 1871 amounted to $3,309,000.

Less is known of early Finnish history than of that of any other European country. The inhabitants, pagans, were governed by their own independent kings until about the middle of the 12th century. Their piracies at this period so much harassed the Swedes, that St. Eric, king of the latter people, undertook a crusade against them, and introduced Christianity, and also probably planted Swedish colonists upon their coasts. The Swedes thus acquired a hold upon the country which they retained for several centuries. From this period down to 1809 the history of Finland is included in that of the kings of Sweden, during which the country was the frequent scene of Russian and Swedish wars. By the peace of Nystad (1721), three years after the death of Charles XII., the territory of Viborg, the eastern division of Finland, became definitively Russian. In 1741 the Swedes, hoping to repair their losses, declared war, but in a few months the whole of Finland was overrun by the Russians. In the following year, at Abo, Sweden ratified anew all her former cessions, yielding additional territory also, but recovered the principal duchy. In 1787 Gustavus III. began his great attempt to recover these losses and to humble his antagonist; but the results of the war added little glory to the Swedish arms. In 1808 a fresh invasion from Russia took place, and Sweden purchased peace by the cession of all Finland and the islands of Aland, Sept. 17, 1809. The Swedish language and customs during 750 years had taken such firm root that Russian domination has been unable to modify them. Abo remains in some degree a Swedish city, and the removal of the seat of government to its rival Helsingfors (1819), and of the university (1827), has not contributed to Russianize the ancient capital. Indeed, at the present day Stockholm is for Abo much what St. Petersburg is for Helsingfors. During the whole period from 1809 to 1868 the Finnish diet was not convoked by the Russian government. On Sept. 18, 1863, the emperor Alexander opened the diet at Helsingfors, composed of 48 representatives of the rural population, 80 of the towns, 32 of the clergy, and 141 noblemen. The emperor promised that he would cooperate with this diet in the introduction of reasonable reforms. Several resolutions of the diet of 1863-14, as well as of those which met in 1867 and 1872, have been sanctioned by the emperor. Besides the new electoral law, already referred to, a new church law for the Lutheran church of Finland was published in 1869. A new press law which had been adopted by the diet in 1864 was promulgated in 1865, and was to remain in force only till 1867; but as the diet of 1867 failed to agree on the proposed amendments, it remained in force till 1872, when all the four estates composing the diet declared in favor of the liberty of the press, which the government refused to concede. On April 12, 1872, the customs frontier between Finland and Russia was abolished.

—Language and Literature. The Finnish language (Finnish, Suomen Kieli) is one of the chief branches of the Uralo-Finnish family; being, with the Esthie and Lappic collaterals, kindred to the languages of the Ugrians or eastern Turks, Osmanli Turks, Samoyeda, Tartars, Magyara, Mongols, and Tunguses, whose chief branch is the Manchoes. All these, with some other tribes, constitute the family variously designated as Sycythe, Turanian, Allopyle, Mongolian, or Uralo-Altaic. (See Ethnology, Finns, and Tatarian Race and Languages.) The Kieli, which is spoken by more than 2,000,-000 people, consists of many dialects, of which the principal are the lower, used along the coasts (except the islands and towns, where Swedes have settled), its Abo variety being the dialect used in books; the upper, or that of the inland region, divided into the sub-dialects of Ulea and Viborg, and the varieties of Karelia, Ingrin, &c. The Suomi language is written with 28 Latin or German letters, of which two are repeated at the end of
the alphabet with a diacritic sign, viz., å, ö, ü. It contains, however, but 19 genuine sounds, viz., 8 vowels and 11 consonants. The letters b, c, d, f, g occur only in a few foreign words and in some dialects. k, p, b are the most frequent initials, k, p, t the most frequent consonants, and sound a little softer than in other languages. The concurrence of consonants is avoided, so that the foreign words Francis, Stephen, school, stable become Rantti, Tekkan, koulu, talo. There are many diphthongs. Long vowels are written double. The hiatus is not avoided. A few themes end in consonants, but none in m. The rhythm of the language is trochaic, and the root bears the tone. Raak considers the Suomiic to be the most harmonious of tongues. The radical, which precedes all other syllables, never undergoes any change in its beginning and middle. The theme is originally disyllabic, and often corresponds to monosyllable Magyar roots; thus: kasi, Magyar kis, hand; sata, sata, 100; sori, sier, water; sori, œr, blood; ans, and, word; tesi, tã, stem, acc. The various relations of nouns to one another, which in other languages are expressed both by cases and prepositions, are indicated by post-positions or suffixes, forming from the nominative, which is sometimes the theme with a changed final, 14 cases, of which 7 are simple, the others more full. There are two declensions. The object is indicated by the genitive, nominative, or partitive, according to the shade of meaning. Plurality is denoted for the nominative suffix by adding t, and for the other cases by inserting i before their endings. In some instances a euphonic e is inserted before the endings. Vocal harmony is strictly observed between the vowels of the theme (in nouns as well as verbs), and for this purpose the vowels are distinguished into three groups, viz.: a, ò, û; a, e, ò; and a, ò, û; those of the first and last having an accent of another word, too, being compatible with those of the middle one. Hence the vowels of the first and last group are converted reciprocally in the suffixes, in order to suit the vowels of the theme; for instance, mas-te, land-part, but pâd-tã, head-part. No language of this family has grammatical genders, but all indicate sexes either by distinct words or by epithets. The Magyar alone uses an article. The adjectives in Suomiic are inmutable, and are rendered comparative by suffixing apa, ma, miu, and superlative by inserting t before that termination. Nouns and adverbs receive an intenser meaning by inserting apa and impa. The numerals are: 1, yksi; 2, kaksi; 3, kolme; 4, neljä; 5, viisi; 6, kuusi; 7, seitsemän; 8, kahdeksan; 9, yhdysään; 10, kymmenen; 11, yksi-to-ista-kymmenäntä; 20, kuuti-kymmenäntä; 30, kolmi-kymmenäntä; 100, sati; 1,000, tuhannen. The possessive is formed by a suffix, as iä, a father; iäni, my father; iänä, thy father; iänä, his father; iänä, our father; iänä, your father; iänä, their father. The verbs have but two simple tenses, viz., the present and past, the others being periphrastic. Their conjugation is more complicated than in any other family of languages, expressing by certain syllables inserted between the theme and the personal suffixes all voices, modes, species, and other nice shades of meaning. The infinitive shares more than in any other language in the nature of a noun; it comprehends the Latin gerunds, supines, and other shades of sense, and is declinable. The Finnish language has no separable particles, and even affirmation is expressed by means of the auxiliary olen, I am, and negation by means of the verb e. By connecting several such significant syllables into one word, the most complicated ideas may be very precisely expressed, which often require many separate words in other languages. Derived words may be formed almost indefinitely. The construction is extremely free, as in Magyar, without endangering the clearness of the sense; as for instance:

Katto kyölelä menti kyöldeänän, ja kyöldeänän
Loi sower went sow-to, and sowing-while
lankesiaat munamat tiien ohem ja linnut
fell some (seeds) road's edge-on, and birds
pullaat, ja siedät na.
came and picked-up them.

The best grammars of the language are those of Juden (Viborg, 1818) and Koskinen (Abo, 1886), in Swedish. Finnish dictionaries have been published in Latin and Swedish by D. Justenius in 1745, Renwall in Latin, Swedish, and German (Abo, 1826), C. Helenius in Swedish (Abo, 1888), and E. Lönnrot (Helsingfors, 1885).

—The national songs or runes of the Finns may be divided into mythological and lyrical songs. They are sung by Kuololainen (song men), to the sound of the favorite national instrument, the kantele, a species of harp with five wire strings. They have also magic songs (Lvunt), which are not sung but recited in a solemn measured tone. The songs, scattered among the people for generations past, and some of which had been published since the beginning of this century, were at length collected by Lönnrot and published at Helsingfors in 1885 under the title of Kalesula, which work is now regarded as the great national epic of Finland. So great was its success that the Finnish literary society took immediate measures for a more comprehensive collection, and the second edition, which appeared in 1849, contains 60 songs, with 22,790 verses, while the first edition contained only about half as many. A Swedish translation of the poem by Castrén (Helsingfors, 1844) was speedily followed by a French translation by Léouzon le Duc (Paris, 1845), and by a German translation by A. Schiefer (Helsingfors, 1853). Lönnrot has further collected about 600 ancient lyrical songs and 60 ballads (Kanteletar, Helsingfors,
1840); 7,077 proverbs (Suomen kansan sanalukija, 1842); and about 2,200 charades (Suomen kansan orevölkikä, 2d ed., 1851); while Rudbäck has edited a collection of legends and tales (Suomen kansan satuja, Helsingfors, 1854); and Salmenlaitinen has edited Suomen kansan satuja ja tarinoita, a collection of prose tales and proverbs (4 vols., Helsingfors, 1854–62).

There are many poets in Finland of Swedish descent, and Swedish works are often translated into Finnish. The most popular modern Finnish poet is a peasant named Paavo Korhonen. An edition of his songs was published at Helsingfors in 1846, under the auspices of Lönnrot. Next in rank is probably the poet Oskaselta, who published in 1860 Silkenia, kokous runoutta. The prose literature of Finland was formerly devoted almost exclusively to religious and moral subjects. A Finnish translation of the New Testament by Michael Agricola appeared in 1548, and a portion of the Old Testament in 1552; but the whole Bible was not translated into Finnish until 1649. The literature of Finland has, however, passed through a remarkable development during the last few decades. There are now publications in the national tongue on almost every branch of scientific research. Works on linguistics have been published by Geitlin, Stjernsmitz and Rothman, Ahlman, and others; a translation of Tacitus's Germania by Blomstedt (1865), of the Poema del Cid by Estlander (1865), and of the Hindoo epos Ramayana, part Siivara-nam, by Donner (1865). Prominent historical works are: Yrjö Koskinen's Nuutj-sota, etc. (1857 et seq.), Blomstedt's Kapina Kauhajolla (1862), and Peltz's Yleisen historian oppikirja (1865 et seq.). Krohn's Suomenkielen runoliusvu ruotsiinsallan aikana (1892) is a valuable contribution toward a history of Finnish literature. Periodical literature is well represented by Maailma ya mereen taka (since 1844) and the Kirjallinen kuukausinen (since 1886).

FINLAND, Gulf of, the eastern arm of the Baltic sea, extending from the S. W. extremity of Finland and Dago island eastwardly to the bay of Cronstadt and St. Petersburg, between 52° and 60° 30' N., and intersected by the 6th parallel of north latitude. It is 250 m. long, with a mean breadth of 60 or 70 m. Its coasts are entirely Russian possessions; namely, Finland on the north, and the governments of Esthonia and St. Petersburg on the south. Its E. extremity is the bay of Cronstadt, which is almost encircled by the shores of the last named government. The waters of the great lakes Onega and Ladoga, N. E. of St. Petersburg, flow into the gulf of Finland, the first by the river Svir into Lake Ladoga, and the latter by the Neva into the bay of Cronstadt. The bottom of the gulf, in part covered by sand and rock, in some parts compact and naked, in others covered and filled with shells. Occasional points of granite are intermingled with this general character. The depth of water is nowhere great, and is least along the southern coast, of which the submerged descent is gradual. The northern shore is much hemmed in with islands and granite rocks. In its eastern parts, particularly between Cronstadt and St. Petersburg, are numerous sand banks and shallows. In addition to these the huge masses of ice which in spring and autumn block up the mouths of the rivers present a serious impediment to navigation. The water is very slightly salt, and is readily drunk by cattle. The harbors of the gulf of Finland are closed by ice every year from early in December to the middle or end of April. It has several times happened that the waters of the gulf, driven by westerly gales, have submerged whole streets in St. Petersburg, even up to the first floor of houses; an event against which no provision for the future has appeared possible.

FINLAY, George, a British historian, born at Glasgow in 1800, died Jan. 26, 1875. He enlisted in the Greek war of independence, and afterward resided in Athens, acting for many years as the special correspondent of the London "Times." He was noted for his thorough knowledge of Greek topography, art, and antiquity, and wrote a series of works on Greek history, comprising "History of Greece under the Romans" (1848; 2d ed., 1857); "History of Medieval Greece and Trebizond" (1851); "History of the Byzantine and Greek Empires from 716 to 1057" (3 vols., 1858–64); "History of Greece under Othman and Venetian Dominion" (1854); and "History of the Greek Revolution" (2 vols., 1861).

FINLAY, John, a Scottish poet and biographer, born in Glasgow in 1792, died at Moffat, Dec. 8, 1810. His principal poem, "Wallace, or the Vale of Ellums," was published when he was only 18 years old. The more important of his other works are: "Scottish Historical and Romantic Ballads, chiefly Ancient, with Explanatory Notes," etc. (8 vols., Edinburgh, 1808), and a "Life of Cervantes." He also edited Blair's "Grave" and Smith's "Wealth of Nations."

FINLAYSON, George, a British surgeon and traveller, born in Thruso about 1790, died on the passage from Bengal to Scotland in August, 1823. He was a surgeon in the British army, was present at the battle of Waterloo, and served in Ceylon and India. In 1821 he accompanied Crawford in his mission to the sovereigns of Siam and Hué (Cochin China), and wrote an interesting journal of it, which was edited and published after his death by Sir T. S. Raffles (London, 1825).

FINLEY, James Brady, an American clergyman, born in North Carolina, July 3, 1781, died in Cincinnati, O., Sept. 6, 1856. He joined the Ohio conference of the Methodist Episcopal church in 1819. From 1816 to 1821 he was presiding elder of the Steubenville, Ohio, and Lebanon districts. In 1821 he was sent as missionary to the Wyandot Indians, where he remained six years. Retaining the superintendency of this mission for two years, he subse-
FINLEY, Samuel, an American Presbyterian clergyman, born in Armagh, Ireland, in 1715, died in Philadelphia, July 17, 1766. He arrived in America in 1734, studied theology, and was licensed to preach in 1740. The first part of his ministry was occupied with itinerant labors in promoting a revival of religion. In 1744 he was settled at Nottingham, Md., where he remained seven years, and carried on in addition to his ministerial labors an academy which acquired a high reputation. On the death of President Davies of the college of New Jersey, he was chosen his successor, and removed to Princeton in 1761. The college flourished while under his care.

FINMARK, a bailiwick of Norway, forming the N. E. division of the province of Tromsö, and the northernmost region of the continent of Europe, formerly including also what is now the bailiwick of Tromsö; area, 18,906 sq. m.; pop. in 1872, 20,829. It lies wholly within the arctic circle. Its northernmost point is the North cape, in lat. 71° 10'. Its coasts are thickly indented by long winding inlets, and are bordered by a vast number of irregular islands. It has important cod fisheries. The principal rivers are the Alten and Tana, the valleys of which are fertile and well cultivated. The climate of the coasts is so mild that some of the fords never freeze. Hammerfest, an active trading place, is one of the principal towns.

FINN, Henry J., an American actor and author, born at Sydney, Cape Breton, about 1758, perished in the conflagration of the steamboat Lexington in Long Island sound on the night of Jan. 13, 1840. He went to England in his youth, on the invitation of a rich uncle residing there, who died without making any provision for him, and he was obliged to resort to the stage for a support. After a few years he returned to New York, subsequently revisited England, and in 1822 made his first appearance at the Federal street theatre in Boston. He was one of the most popular actors on the stage, his forte being broad comedy. He accumulated a competency, and was on his way to his residence in Newport, R. I., at the time of his death. He enjoyed a considerable reputation as a comedian and playwright, and published a "Comic Annual" and a number of articles in the periodicals. He published a drama entitled "Montgomery, or the Falls of Montmorenci," which was acted with success, and he left besides a manuscript tragedy.

FINLEY, Charles G., an American preacher and author, born in Warren, Litchfield co., Conn., Aug. 29, 1792, died at Oberlin, O., Aug. 18, 1875. He studied law in Jefferson co., N. Y., but became a preacher in 1824, and labored as an evangelist with great success until 1855, when he accepted a professorship in Oberlin college, Ohio; and in 1887 he became pastor of the first Congregational church at Oberlin. He continued to preach in New York and elsewhere at intervals, and in 1848 went to England, where he remained three years. In 1853 he became president of Oberlin college, which position he held until 1866. His principal works are: "Lectures on Revivals" (Boston, 1835; 18th ed., 1840; new and enlarged ed., Oberlin, 1868); "Lectures to Professing Christians" (Oberlin, 1886); "Sermons on Important Subjects" (New York, 1889); and "Lectures on Systematic Theology" (2 vols. Svo, Oberlin, 1847). All of these have passed through several editions. FINNS, a race of men inhabiting portions of N. and E. Europe and N. W. Asia. The most important divisions of this race, besides the inhabitants of Finland or Finns proper, are the Lapps, Estha, Sirians, Permiaks, Votiaks, Teheremisecs, Mordvins, Bashkirs, Tchuvashes, Voguls, Ostiaks, and Magyars. They thus comprise the extensive group of languages and tribes which ethnologists and philologists designate as the Uralo-Finnic branch of the Mongolid, Turanian, or Uralo-Altaic family. (See ETHNOLOGY.) The Finns are related to the Huns, Avars, and Khazars; but it is not positively known when they took possession of their present habitats, and from what direction they moved into them. They are in every respect of the Mongolid type, having not only its general physical character, but also its mental and temperamental characteristics. They are distinguished by the same gravity of demeanor and concealment of emotions; by deliberation of speech and the absence of violent gesticulation; by the rarity of laughter, and by plaintive and melancholy songs. It was until recently the universal opinion of ethnologists that they were a younger branch of the Asiatic Mongolians, and consequently that they emigrated from east to west. There are, however, reasons for supposing that the Finnic languages represent the oldest forms of speech among the Uralo-Altaic group. They possess, for example, the strongest marked features of the whole family, and bear the closest analogy to the Indo-European tongues. From these facts the conclusion has been drawn that the primitive Finns and Indo-Europeans were neighbors, and that the two families of languages were formed at the same time. The authorities who hold this view do not suppose that the Indo-Europeans must be placed where the main body of them is still found, maintain accordingly that the Finns still inhabit their primitive soil, and that they are the ancestors and the stem of the Asiatic Turanians. One of
the least expected results of the decipherment of the Babylonian and Assyroian cuneiform inscriptions is that the most ancient language found in this style of writing is strongly allied to the idioms of the Uralo-Finnic race, and that many of its words and the greater part of its grammatical forms particularly resemble the Finlandish. It is therefore conjectured that the Finnic race was in possession of the Tigris and Euphrates basin more than 4,000 years ago; and in retracing the ideographs of the cuneiforms to the objects they originally represented, it is found that the region where this system of writing was invented was a northern clime; at least one totally different from that of Babylonia and Assyria, destitute, among other things, of large feline carnivora and of palm trees. The French ethnologist Quatrefages maintains in his recent work on La race prussienne that the Prussians proper are of Finnic descent, but apparently without sufficient evidence. Belgeau, on the other hand, argues, in his Ethnologie gauloise, that the pre-Aryan race which inhabited France must have been Finns; but this hypothesis also has no sufficient basis. Finnic elements are also discovered in the Basque language and in the remnants of the Etruscan. As Tacitus, however, speaks of Fenni among the German tribes, and as the Finnic languages are strongly intermixed with Celtic forms, it is probable that the Finns occupied at a remote time the low lands of Germany to the confines of Gaul. Certain it is that they inhabited for a long period the whole region between the Volga and the Ural rivers, and that the Magyar tribe dwelt in the district of the Kuma. The Finns also overran the southern portion of Sweden, and perhaps Jutland; but they were driven out of the country W. of the gulf of Bothnia as early as the 9th century. - The Finns and W. Russians belong either to the Greek or to the Lutheran church. Before the 12th century they adored numberless fetiches, besides a god of heaven and earth whom they called Yumala, Yumula, or Yumara, according to the dialect of the tribe, and also Num on the E. shore of the White sea. The other Finnish deities were tribal gods adopted in the course of migration and development. In Finland there are about 1,500,-000 Finns proper, many of whom have adopted the civilization of the Swedes, their former conquerors, but are reluctant to become Russianized. The peasants of the interior still live in a very rude and simple manner. The dialect of this branch of the Finnic race is considered one of the most harmonious and softest languages spoken. (See Finland, Language and Literature.) The Finns proper are subdivided into Tavasta and Karolians. The Tavasta, who inhabit the S. W. districts of Finland, are great agriculturists, besides paying much attention to breeding cattle. They are nevertheless one of the poorest and humblest branches of the whole race. They designate themselves as Flamalaiseth, and are estimated to number about 600,000. More vivacious and less rude than the Tavasts are the Karelians, whom the other Finnish tribes call Karialaiseth. They inhabit the eastern portions of Finland and the adjoining governments of Russia, and number above 1,000,000. The Lapps are distributed over portions of Sweden, Norway, and Russia, and are only about 18,000 in number. In the government of St. Petersberg dwell nearly 18,000 Ingrams and about 5,000 Voita or Vatialaiseth. The Estha, in Esthonia, Livonia, and the neighboring governments, number upward of 500,000; the Tchuda proper, in Olonetz and Novgorod, about 16,000; the Livs and Krevings, in Courland and Livonia, are becoming extinct, numbering little more than 2,000 persons. All these together form the Tchudic branch of the race. The Permian branch occupies regions between the Ural mountains and the Volga and Dvina. There are about 50,000 Peasants of Finland.

Permians in the government of Perm, who without their Finnic language could scarcely be distinguished from the Russians. They raise cattle, are very poor, and their customs are similar to those of the Votiaks, who number about 185,000, and live in villages of 20 to 40 houses between the Kama and the Viatka. With the latter are mingled the Bisermians, about 5,000 in number, greatly resembling the Permians. The Sirians, between lat. 60° and 66° N., chiefly on the Vyetchegda, number about 70,000, speak exclusively their own dialect, and belong to the Greek church. On the central Volga, and between that river and the Oka, dwells the Volgaic or Bulgaric branch, numbering more than 1,000,000, among whom the Mordvins, upward of 400,000, seem to be the
FIR. 207

dominant class. The writers of the middle ages speak of the Mordvinis as being very cruel, and accuse them of cannibalism. They are now considered intelligent, industrious, and honest; they cultivate the soil, and raise cattle and bees; they live in huts with the door opening to the east; and though they profess to be Christians, they are still given to many superstitious practices. Their dialect is similar to that of the Tchermisises, whose language is strongly intermixed with Tartar and Russian. The Tchermisises are scattered over the governments of Vistska, Kazan, Nizhni-Novgorod, and Kostroma, and are estimated at 150,000. Those living on the right shore of the Volga are called highland Tchermisises, and others Tchermisises of the plain. The Tchuvashes number about 450,000, and live in Kazan, Simbirak, Saratov, and Orenburg. Their religion is neither Christian, Mohammedan, nor pagan, but a mixture of the three, with paganism in the ascendant. The principal tribes among them are the Vereyal and the Kereyal, and their chief occupations are agriculture, bee culture, and cattle raising. The abodes of the Ugric branch are widely distributed. The Ugrian tribe proper and the Ostiaks live in the neighborhood of the Saymoyed, in the Siberian government of Tobolsk. They are half savages, and, though nominally Christians, adhere to Shamanism. Their language is a primitive Finnish dialect mingled with Tartar, and resembles closely that of their neighbors the Voguls, who inhabit the eastern slope of the Ural, number about 2,000, and are similar to the Calkmucks. They live in villages of four or five yurts (tents of felt), dress in caftans, and are peaceable, jovial, lazy, and poor. Their principal occupations are hunting and fishing. The Bashkirs are also now considered to belong to the Finnish race. (See Bashkirs.) The Finnish tribe of Mezhtcheriaks has adopted a Turkish dialect and the Mohammedan faith. For the most important division of the Ugric branch, and of the whole race, the Magyars, see HUNGARY.—

The following are valuable recent works of reference on the subject: Schnitzler, L’Empire des tatars au point actuel de la science (Paris, 1882); Ouno, Forschungen im Gebiete der alten Volkerkunde (Berlin, 1871 et seq.); Koskinen, Finnische Geschichte von den fruhesten Zeiten bis auf die Gegenwart (Leipsic, 1873); also the periodical Archiv für wissenschaftliche Kunde von Russland, published in Berlin.

FINTERRAARHORN, the loftiest peak of the Bernese Alps, 14,108 (or according to another measurement 14,026) ft. high, situated W. of the Grimsel, and visible from the new carriage road completed since 1887 over the Furca pass. The summit is accessible from the Faulberg hut, 5 m. from Lake Morjelen. Although the mountain is surrounded by stupendous glaciers, the highest point is said to be free from snow and ice, owing to its needle-like formation, whence it is called the Nadler; it is about 20 ft. long. The S. part of the mountain is called also Schwarzhorn, on account of the dark appearance of the rocks. Various attempts to scale the summit have been made during the last 60 years, with varied success; those made most recently have been most successful.

FIORELLI, Giuseppe, an Italian archaeologist, born in the province of Naples about 1828. He early became one of the directors of the excavations at Pompeii, but being denounced as a liberal, he was removed and subjected to privations and persecutions, despite the protection of the count of Syracuse, brother of the king of Naples, and not restored until the occupation of the kingdom by Victor Emanuel in 1860. He has since been the chief superintendent at Pompeii, and has made considerable progress in the restoration of the excavated buildings, and in the prosecution of new excavations, an annual allowance of 60,000 francs being granted by the government for that purpose. He has published one of the best maps of the uncovered portions of the city, and a chronological history of the discoveries (1860 et seq.), and edits the Giornale dei scavi, a journal containing a daily record of the excavations, from their beginning.

FIorentino, Pier-Angelo, an Italian author, born in Naples in 1806, died in Paris, May 31, 1864. He early published novels, poems, and dramas, including La Fornarina and Il medico di Parma. Alexandre Dumas pere, while at Naples, induced him to settle in Paris, and to aid him in the preparation of works relating to Italian life, some of which, especially Jeanne de Naples, were regarded as the exclusive production of Fiorentino. He wrote French with the same facility and elegance as Italian. He went to Paris with 150 francs, and left 600,000 francs, acquired by literary labors.

FIR, the popular name of several species of trees of the genus abies. Some botanical authors class the trees known as firs, spruces, and hemlock spruces in the one genus abies, while some others make three genera: abies for the spruces, picea for the firs, and tsuga for the hemlock spruces. In a botanical view, however, it seems better to group them all under abies, and consider the picea and tsuga as subgenera of abies proper. The firs are more closely related to the pines than are any other of the large family of conifera. While in the genus pinus the leaves are in clusters of two to five enclosed in a sheath, in abies they are scattered on the branches, and sometimes two-rowed. In abies proper, the spruces, the short, needle-shaped leaves are scattered around the branches and the cones nodding or pendant, with the scales persistent; in the section tsuga, the hemlocks or hemlock spruces, the flattened and petailed leaves are arranged as in two rows; and in the section picea, the firs, the leaves are somewhat in two rows, the cones at maturity are erect, and the scales fall away from the supporting axis. In the present article we confine ourselves to the last named division.—

321 VOL. VII.—14
The firs are especially inhabitants of the colder parts of the world, though some are found in Asia and Mexico. The N. W. coast of North America is especially rich in firs, some of which assume majestic proportions in their native localities, and on account of their symmetrical forms are highly prized in cultivation. The timber of the firs for the most part does not rank among the most valuable kinds, though that of some species is remarkable for its durability; but the several resinous products they furnish have considerable commercial and economical importance. The best known native species is the balsam or balm of Gilead fir, *abies balsamea*, which is found from Pennsylvania northward, and is especially abundant in the British provinces. It grows 40 to 50 ft. high, and furnishes a wood of but little value; its striking characteristic is the liquid turpentine or "balsam" which it furnishes. This is found in vesicles or blisters in the bark, related to this species, and at one time confounded with it, is Fraser’s balsam fir (*A. Fraseri*), which extends much further southward; it has smaller cones and differently shaped bracts, but is similar in other respects.—On the Pacific coast is found one of the finest of the firs, and indeed one of the grandest of coniferous trees, *A. nobilis*, the noble silver fir; upon the mountains of the coast, at an altitude of 8,000 ft., it attains the height of over 200 ft.; it has a cinnamon-colored bark and very large cones, which are noticeable for the conspicuous points of the bracts. This fine species is highly prized in England as an ornamental tree, but it has not been sufficiently tested in the Atlantic states to prove whether it is perfectly hardy or not. *A. grandis*, the great silver fir, is

Balsam Fir (*Abies balsamea*),

which remains smooth even on old trees. This exudation is known as Canada balsam or balsam of fir; but as the term balsam is now restricted to those oleo-resinous products which contain either benzoic or cinnamic acid, the proper name for the exudation from this fir is Canada turpentine. It is a clear, transparent fluid, of a honey-like consistence and a strongly terebinthinate taste. It consists of resin in solution in turpentine, and when exposed to the air loses the volatile turpentine and becomes brittle. It is collected by puncturing the blisters and receiving the liquid in a bottle or other receptacle; and as each vesicle yields but a teaspoonful or two, the process is a slow one. Formerly it was considerably employed in medicine, but as it possesses only the stimulant and diuretic properties of other forms of turpentine, its present chief use is in mounting microscopic objects and in serving as a varnish for maps, for which purpose it is diluted with spirits of turpentine. When young, the balsam fir is remarkable for its beauty of color and symmetry.
another species of the Pacific coast, and is found more abundantly northward; it attains even a larger size than the last named, and in its native localities is converted into lumber for exportation to the Hawaiian islands and elsewhere. This has been found hardy by the eastern cultivators. The lovely silver fir, *A. amabilis*, is another large tree of northern California and Oregon. — Among species of fir of the eastern hemisphere, the most common is *A. petiolaris*, the common silver fir, which has been planted in this country to some extent; but it has one of the faults of our balsam fir, being short-lived. It is a native of the mountains of central Europe and of those of Asia, and attains the height of a first-class tree; its wood is of great value, being used in carpentry and boat building, for masts, and even for carved work; its bark is used for tanning and it is equal in grain and color to Bermuda cedars. It is valued in England as an ornamental tree. Other species, the value of which in this country has not yet been sufficiently determined, are *A. Apollinis*, from Greece; *A. bracteata*, from Oregon; *A. Cilicia*, from Asia Minor; *A. Pinae*, a native of the mountains of Spain; *A. Vietchii*, from Japan; and *A. religiosa*, the sacred silver fir of Mexico.—Very full accounts of the history and uses of the species of fir may be found in the fourth volume of Loudon's "Arboretum et Fruticetum," and brief descriptions, with the nomenclature corrected according to the views of modern botanists, in Hooper's "Book of Evergreens" (12mo, New York, 1868). (See HEMLOCK, SPRIKE, LARCH, and SPRUCE.)

**FIRDUSI, Ferdousi, or Ferdousi, Abul Kasim Mansur**, a Persian poet, born near Tus, in Khurasan, about A. D. 946, died in Tus in 1020. He was often called Thusi from that city, and his ordinary name (Firdous meaning both garden and paradise) was given him either because his father was a gardener or from the excellence of his poems. He continued to reside for many years in his native village, and occupied himself with the traditions concerning the ancient kings of Persia. He was advanced in age when he repaired to the court of Mahmood of Ghuzni, where he was presented to the most distinguished scholars and poets of the time, and encouraged by the sultan to compose his great historical poem, *Shah Nameh*. He spent 80 years upon this work, which contains 60,000 verses, and relates the mythical and romantic exploits of the Persian kings from the foundation of the world, that is, from the hero Kaimurs, who disputed the earth with genii, to the invasion of the Mussalmans about A. D. 686. Its most interesting portion is the account of the prowess of the hero Rustem. Receiving 60,000 silver, instead of the same number of gold dirhems promised to him by the sultan, he is said to have distributed the whole sum, in three equal parts, to the slave who brought it and two attendants of the bath where he received it. He was sentenced to death for having treated the sultan's gift with so much indignity, and with difficulty procured a revocation of the sentence. He then fled from the court, leaving behind him a bitter satire on the sultan, and took refuge first at Mazendaran and afterward at Bagdad. Being finally permitted to return to his native town, he spent there, according to some narratives, the remainder of his life; but according to others he died before receiving the pardon of the sultan, which was accompanied by munificent gifts. The *Shah Nameh* is one of the oldest poetic monuments of Persian literature, and is regarded by the orientals as an authority in regard to the primitive history of western Asia, and especially by the disciples of Zoroaster, since it contains his praises, and its mythology is that of the religion he taught. It is really, however, of little value as a historical authority. Its true merit con-

FIRE. See FLAME, HEAT, AND LIGHT.

FIRE BEETLE. See Firefly.

FIRE ENGINE, a machine for throwing a stream of water for the purpose of extinguishing fires. The earliest notices of machines used for this purpose are in some allusions of ancient Roman writers to an apparatus, nowhere described, which they called a alpha, and which some now regard rather as the name of the aqueduct pipes for supplying water to houses than as an especial fire-extinguishing machine. That they were very insufficient may be inferred from the remark of Seneca, that owing to the height of the houses in Rome it was impossible to save them when they took fire. Apollodorus the architect, perhaps, was the first to suggest the use of a kind of hose, in recommending for the conveyance of water to high places exposed to fiery darts the use of the gut of an ox having a bag filled with water affixed to it; by compressing the bag the water was made to rise in the tube. In early periods of English and French history the chief protection against destructive fires appears to have consisted in the care with which those used for domestic purposes were managed. The curfew bell, or couvre feu, was sounded at 8 o'clock as a signal for the fires to be extinguished. In Germany fires were of frequent occurrence in the latter part of the 15th century and in the 16th; and ordinances were established regulating the manner of building houses and the methods to be adopted in preventing fires. At Augsburg fire engines, called "instruments for fires" and "water syringes useful at fires," were in use in 1518. The Jesuit Kaspar Schott describes one he saw at Nuremberg in 1557, which much resembled those in use at the present time; and he mentions that 40 years before he had seen a similar engine of smaller size in his native city, Königsboden. The one at Nuremberg was placed upon a sledge 10 ft. long and 4 ft. broad, which was drawn by two horses. It had a water cistern 8 ft. long, 4 ft. high, and 2 ft. wide. It was moved by 26 men, and forced a stream of water an inch in diameter to the height of 80 ft. The cylinders are described as lying in a horizontal position in a box. No mention is made of an air chamber, nor of anything more than a short flexible discharge pipe, which could be directed to one or the other side. The oldest record of fire-engines in Paris is in the work of Perrault, published in 1654. From this it appears that there was one in the king's library, which, though having but one cylinder, threw out the water in a continuous jet to a great height; a result attained by the use of an air chamber, of which, as introduced into the fire engine, this is the earliest notice. Destructive fires were of frequent occurrence in Paris and in the provinces in the latter part of the 17th century, the work of incendiaries, who were known as bouffeurs. In 1689 a special officer was charged with the duty of constructing, keeping in repair, and using at fires the 17 pompes portatives belonging to the royal service, and in 1722 the number of these had increased to 30. There were besides many others not included in this particular service. It is believed that none were provided with air chambers; for in 1725 a paper was published in the Mémoires of the academy of sciences at Paris describing this improvement, as adopted in the engines at Strasbourg, and in it no intimation is expressed of the same contrivance ever having been introduced in Paris. Leathern hose was invented about the year 1670 in Amsterdam by two Dutchmen named Van der Heyde, and the apparatus was speedily introduced into all the engines of the city. They also invented the suction pipe. In 1690 the inventors published a folio volume containing engravings, the first seven representing dangerous conflagrations at which the old engines had been used to little purpose; the twelve following represent fires which had been extinguished by the new engines, and the method of working the machines. The details of their construction are not given. The title of the work, which is regarded as exceedingly valuable on account of its excellent engravings, is Beschrijving der nieuweijken stangen-brand-spuiten.—It was long before the inventions of the Dutch were introduced into England. At the close of the 16th century the only engines there known were "hand squirts," or syringes, made of brass, and holding two or three quarts of water. Some of them are still preserved in the vestry room of St. Dionis Backchurch in Fenchurch street, London. Each one required the labor of three men, one on each side to hold the instrument steady with one hand, and with the other to direct the nozzle, while the third man worked the plunger. When discharged, the piston was taken out and the nozzle was dipped into water, which flowed in and filled the body. They were afterward fitted into a portable cistern, and furnished with levers for working the pistons. About the close of the 17th century Newsham's improved engine was patented in England. This was a strong cistern of oak, placed upon wheels, furnished with pumps, air chambers, and a suction pipe of strong leather, to prevent its collapsing when the air began to be exhausted from it by the action of the pumps, through which was run a spiral piece of metal. The end for receiving the water was provided with a strainer. In case the suction pipe could not be conve-
is screwed a tip of any required bore, which is held in the hand to direct the stream upon the fire. A suction pipe from the lower end of the force pump is always ready to be used when necessary; but where a stream of water with sufficient head, as from the aqueduct hydrants, can be introduced, the suction pipe is not required. The machine is attached to a carriage constructed expressly for the purpose, and furnished with various implements such as are likely to be wanted in conflagrations. The brakes are long wooden arms extending over the wheels each way beyond the extremities of the engine, or sometimes transversely to the carriage, and attached at right angles to the lever beams, which are arranged along the horizontal axis placed over the centre of the carriage. They are moved up and down by men standing on the ground each side of the engine, working with others who take their position on the top.—The great modern improvement in fire engines is the application of steam power to work them. This was first attempted by Mr. Brathwaite, in London, in 1826. His first engine was of barely six-horse power, weighing a little over 5,000 lbs., was furnished with an upright boiler, in which steam was generated to a moderate working pressure in 20 minutes, and was capable of forcing about 150 gallons of water per minute from 80 to 90 ft. in height. It had a steam pump of the same form as those now in common use, the steam and water pistons being on opposite ends of the same piston rod, the former being 7 in. in diameter and the latter 6 ½ in., and the stroke of each 16 in. A larger engine of the same general construction was built by Brathwaite in 1832 for the king of Prussia; but though its performances were highly spoken of, this attempt to apply the power of steam for fire-engine purposes cannot be said to have been successful. The time required for raising steam, and the great weight of the apparatus when adequate boiler power was obtained, were undoubtedly the principal difficulties. In New York, after the great fire of 1835, premiums were offered for plans of steam fire engines, and in the year 1841 an engine was built, from plans by Mr. Hodges, under a contract with the associated insurance companies, and was on several occasions brought into service at fires with good effect; but though very powerful, its great weight proved to be a fatal objection, and it
was at last sold and converted to other uses. To the city of Cincinnati belongs the credit of giving the first practical demonstration of the feasibility of this application of steam, and of making steam fire engines the basis of a fire department of unequalled efficiency. They are usually drawn by horses, one or two pair being used; but in a few instances steam has been successfully employed to propel them. Such a one, made by the Ameskeag manufacturing company, was brought into use at the engine house No. 20 in New York city in 1873. A view of it is given in the preceding engraving, in which b represents the boiler; a, the air chamber for compressed air; c, c, steam cylinders for working the pumps, p, p, through eccentrics not shown, moving at the same time the small balance wheel, over the pulley of which is seen a stout chain which passes over a drum on the axle of the drive wheel, k. The suction hose is attached at d, and the discharge hose at f, which is connected with the air chamber.

The apparatus for steering is controlled by the capstan, g, placed in front of the driver’s seat. This engine weighs about four tons, and is capable of propelling itself at the speed of a rapid trot. It has a capacity for throwing water through a 14-in. nozzle to a height of 140 ft. and to a horizontal distance of about 250 ft. Through a 14-in. nozzle it will throw a stream about 320 ft. vertically and 800 ft. horizontally. The usual working pressure of steam is from 60 to 80 lbs. per square inch, the steam escaping by a safety valve when above the latter pressure. When standing at the engine house the boiler is kept supplied with water and steam from a heater in the basement, at a pressure of about 70 lbs. per square inch. The fireplace is kept charged with kindling wood and other combustibles, which are capable of supplying sufficient heat in one minute after ignition, during which time the water and steam supplied from the heater are capable of giving the required force.

A FIRE EXTINGUISHER. Many apparatus have been made to produce apparatus to extinguish fires by excluding atmospheric oxygen from the flame. Among the earliest machines of this kind was that known as Phillips’s fire annihilator, which was made of several sheet-iron cylinders placed one within another. Water was contained between the two outer ones, which when heated generated steam and discharged it into an inner cylinder. Within the latter was the gas-generating mixture, a compound of charcoal, nitre, and gypsum. An apparatus for igniting it consisted of a bottle of chlorate of potash and sugar, upon which could be emptied another of sulphuric acid. A mixture of gases and steam was expelled from the top of the machine.—An apparatus for extinguishing fires was invented by M.M. Carlier and Vignon of Paris, and patented by them in 1869, for which a patent was issued in the United States in 1869 and reissued in 1872. The principal advantage possessed by this machine consists in charging water with carbonic acid gas and projecting it into the fire by the force of its own pressure. Such a machine, made by the Babcock manufacturing company of New York and Chicago, who own the American patent, is represented in figs. 1 and 2.

Fig. 1.

Fig. 2.

Metallic cylinder, of sufficient strength to bear an internal pressure of over 250 lbs. per square inch, contains in its upper part a glass or leaden vessel capable of holding 8 or 10 oz. of sulphuric acid. It is suspended by two pivots placed upon opposite sides and below the centre of gravity, but retained in an upright position by means of the stopper, which is held in the mouth of the vessel by a rod which passes through the hermetically adjusted cover. About 7 gallons of water holding in solution 21 lbs. of bicarbonate of soda is placed in the large cylinder, and about 8 oz. of commercial acid is put in the glass or leaden vessel, and held in position by the stopper and the rod which passes through the cover. The latter is then clamped to its place, and if the stopper be removed the vessel will become inverted by its own weight and the acid precipitated into the solution of carbonate of soda. This causes the liberation of a quantity of carbonic acid gas, which at the ordinary pressure would occupy nearly eight cubic feet, but which under the pressure produced by its own elasticity, in this case about 100 lbs. per square inch, remains dissolved by the water. If a hose be attached to the stopcock placed in the lower part of the cylinder, a stream of water holding carbonic acid gas in solution is forced out with great rapidity, carrying with it bubbles of gas which
are suddenly liberated by the diminution of pressure. It has been found that when this stream is projected upon a fire it possesses extraordinary extinguishing powers. A pair of large extinguishers may be mounted upon a carriage drawn by horses. This, known as the Halock self-acting fire engine, is shown in fig. 3. These cylinders are capable of holding about 75 gallons each, and of sustaining an internal pressure of 400 lbs. per square inch. Many are in use in the United States, and are found to render efficient service in extinguishing fires before they have spread to much extent, and even then they may be used with advantage as aids to the steam engine, or alone.

**Firefly**, the popular name of many sericocorn beetles, belonging to the families elateridae and lampyridae, and to the old genera elater and lampyris of Linneus; the luminous species of the former belong to the new world, those of the latter to both hemispheres; these insects are also called fire beetles. The elaters have a firm and solid body, of an oval form; the middle portion of the sternum between the first pair of legs is prolonged into a short spine usually concealed in a cavity behind it; the antennae in the males are simply serrated. They are called spring beetles from the faculty possessed by them of throwing themselves upward with a spring by means of the spine; as they live on plants, when they drop to the ground they often fall upon the back, whose great convexity and the shortness of the legs prevent them from turning over; the spine having been unheathed by bending the head and thorax backward, it is made to strike with such force against the sheath by the sudden straightening of the body, that it projects the insect into the air, and gives it the chance of coming down on the feet; if unsuccessful, other attempts are made until the object is attained. Fireflies of this tribe are numerous in tropical America, including the West Indies. One of the largest and most brilliant is the night-shining elater, or lightning spring beetle, the cueho of the West Indies (pyrophorus noctiluca, Linn.); this is more than an inch long, of a dark color, and gives a strong light from two oval tubercles on the dorsal surface of the thorax, and from the under surface of the segments of the body. Specimens are frequently brought into the United States, where they may be kept for some time if fed on sugar cane; the grub is said to be very injurious to the sugar cane by devoured the roots; one of these was once transported to Paris, and escaping into the streets, after assuming its perfect state, very much astonished the inhabitants of that city. This insect is common in summer, both in the lowlands and at moderate elevations; according to Mr. Gosse, the thoracic light is visible even in broad daylight; when undisturbed, these spots are dull white, but they gradually become bright when touched, the brilliancy beginning at the centre and extending until the whole tuberula shines with a rich yellowish green. The light is so intense that it will cast a shadow of any object on the opposite wall in a dark room; the under side of the thorax seems as if it were red-hot, particularly beneath the tubercles; when left to itself, the insect becomes quiet, and the light fades to a mere speck. The insect when held in the hand shows only a green light, but when flying free it diffuses a rich ruddy glow from the ventral surface; it may show the green light at any time, but the red light only when flying; the former is seldom shown during flight, but in rare instances both tints are seen, producing an exceedingly beautiful effect. The thoracic light is subject to the will of the insect, but the abdominal is by some considered involuntary; the former is intermittent, but the latter seems to be a constant red glare, which will illuminate the ground for the space of a yard square. There are more than a dozen other luminous elaters mentioned by Julliger, found in South America, where they fly during dusk and at night, generally remaining quiet during the day. These insects are used by the natives, confined under gauze, as ornaments for their head dresses and garments; they have been usefully employed by the Indians for the purposes of illumination in their dwellings and in their journeys; several, confined in a glass vessel, give light enough to read small print by. This is one of many instances in which an acquaintance with nature has dispelled the fears of the superstitious; the deceitful light of supposed malignant spirits has become the beautiful radiations of an insect sporting amid its inoffensive companions. These insects may be kept for weeks, if fed on sugar cane, and placed in damp moss; their light is more powerful than that of the glowworm. The larvae of many elaters are also more or less luminous. In the adults both sexes are luminous. (See "American Naturalist," vol. ii., 1889, pp. 420-423.—The genus *lampyris* (Fab.) includes the fireflies of the United States and the glowworm of Europe; they are characterized by soft and flexible bodies, straight and depressed; there is no snout, and the head in the males is occupied almost entirely by the eyes, and is much concealed by the thorax; the antennae are short, with cylindrical and compressed articulations; the prothorax is narrowed on the sides; the elytra are coriaceous, and the legs simple; the females have only rudiments of elytra at the base of the abdomen. The glowworms of Europe, *L. noc-
Tiluca, L. Italica, L. splendidula, and L. hemiptera, will be described under Glowworm. In the United States there are many species, of which the L. scintillans (Say) and L. corvus (Linn.) are familiar examples. The latter is 4½ lines long; the body is oblong pubescent, brownish black; a rose-colored arched streak, dilated and yellowish anteriorly, joins the elevated thoracic disk; the elytra are absolutely carinated, with numerous minute dots; it is found as far north as 54°. Both sexes are luminous, but the light is strongest in the female; the light streams from the ventral surface of the abdomen; even the larva of many species, and also the eggs, are luminous. Like the elaters, they conceal themselves by day, and fly about in warm damp evenings; the males fly from plant to plant, while the female remains still, betraying herself to the other sex by her brighter light, of a bluish or greenish white tint. The luminous Lampyride of tropical America are very numerous and brilliant, in the words of Humboldt, repeating on the earth the spectacle of the starry heavens. According to Gosse, their sparks of various degrees of intensity, in proportion to the size of the species, are to be seen gleaming by scores about the margins of woods and in open places in the island of Jamaica. This writer describes many species, the most remarkable of which are Pygolampis zanthophotis and Photuris versicolor. P. zanthophotis is three fourths of an inch long and one third of an inch wide; the elytra are smoke-black; the thorax dark, dark brown in the centre; the abdomen pale, with the last three or four segments cream-white; the light is very intense, of a rich orange color when seen abroad, but yellow when examined by the light of a candle, and intermittent, lighting up a few segments or the whole hinder part of the abdomen. P. versicolor is a large species, with drab-colored elytra, less brilliant in its light and less rapid in its flight than the other species; the light is of a bright green hue; it frequently rests on a twig, gradually increasing the intensity of its light to the brightest, and then by degrees extinguishing it, remaining dark a minute or two, shining and fading again like a revolving light. Sometimes one species is attracted by the other, when the intermingling of the green and orange rays presents a very beautiful appearance. Other smaller species, which fly in at the windows in summer in considerable numbers, have either a yellow or a green light. The little firefly seen in warm summer nights is a species of Photuria; it is the male only that flies; the wingless female, seldom seen, a glowworm, emits a much brighter light; the larva, which resembles the female, is luminous, and, it is said, the eggs are also. Another native species is Photinus pyralis, the larva of which feeds on soft-bodied insects; the adults of hemipterous insects, of the genus Fulgora, are said by some authors to be luminous, though the greatest weight of negative evidence is against this statement; the snout in this genus is long, straight or curved upward, and the light is said to emanate from its extremity, whence their common name of lantern flies. The South American species (P. laternaria, Linn.) is a large and handsome insect, with wings varied with black and yellow; Mme. Merian asserts positively that the light from the head is so brilliant that it is easy to read by it; Count Hoffmannsegg, M. Richard, and the prince of Newied have denied the truth of this statement; but, from the positive assertion of the above lady, the general application of the name firefly to this species, and the possibility that the emanation of light may be perceptible only at certain seasons of the year, it may well be that the insect possesses luminous power. It flies high, and hovers about the summits of trees. Another species (P. canthetaria, Fab.), from China, of a greenish color varied with orange and black, with its long snout curved upward, is said to flit among the branches of the banian and tamarind trees, illuminating their dark recesses.—The causes which produce this light have been the subject of much discussion among naturalists; some lay the principal stress upon the influence of the nervous system, others upon the respiration, others upon the circulation; chemists have asserted the presence of phosphorus in the fatty tissue whence the light seems to issue, but there is no proof of this from analysis. The most recent writers agree that the luminous tissue is made up of fat globules permeated by numerous trachea conveying air, with no traces of nerves or blood vessels, according to Dr. Burnett. It does not appear satisfactorily determined whether there may not be in this tissue phosphorized fats which give forth light on contact with oxygen, hydrogen, or nitrogen. Matteucci concludes from his experiments that the light is produced by the union of carbon of the fat with the oxygen in the tracheae, by a slow combustion, and without any increase of temperature. The intermitence of the light is believed to depend on the movements of respiration, and to be entirely independent of those of the circulation, though Carus says that the light of the glowworm grows brighter with each fresh wave of blood sent to the neighborhood of the tissue. It is probable also that the nervous system has some influence on the light, though it may not be essential to its production; as in the electric fishes we find the physical and chemical elements necessary for the production of electricity, to a great extent independent of, yet brought into harmonious action and directed by, the nervous system, so in the luminous insects we may have the chemical elements necessary for slow combustion and the production of light independent of this system, yet influenced and directed by it; the light may also be directly influenced by the action of the nervous system.
under water. It is said that there is no heat accompanying this light, though it be a true combustion and a combination of carbon with oxygen; this may be owing to the rudeness or imperfection of our instruments, or to the slowness or peculiarity of the combustion.

FIRE-PROOFING, a term applied to processes by which fabrics or buildings are rendered proof against taking fire. Cloths saturated with mineral paint are rendered less liable to inflame from falling cinders or sparks, but cannot be made to withstand continued heat. Several methods have been devised for rendering wood fire-proof. In the United States wooden roofs are partially secured from fire by covering them with a coating of gravel, secured by mixture with coal tar or asphaltum; but of course this affords protection only against sparks or cinders. The English war department several years ago made experiments to test the utility of an application of one of the cheap soluble alkaline silicates, as the silicate of soda. Painting the wood with a strong solution of the salt was very useful. But the best results were obtained by going over the coating of the silicate of soda with another of lime whitewash, and after this had stood a few hours coating it with another stronger solution of the soda. The first solution, it is directed, should be prepared by mixing with one measure of the thick sirup of silicate of soda three measures of water; the wood should be brushed over with this, as much being laid on as the wood can be made to absorb. When nearly dry, the lime wash of creamy consistence is applied, and after this has become moderately dry, the solution prepared with two parts of sirup to three of water is laid on with the brush. The covering thus prepared adhered very well, even when exposed to a stream of water and to rains; the former when striking the wood in the shape of a jet only slightly abraded it, and it was not easily removed by applying heavy blows to the wood. It was found that when the silicate was prepared so as to mix readily with water, one pound was sufficient to cover 10 square feet, and at the rate of £20 per ton of the sirup, the cost of the silicate for this amount of surface is only about twopence. By this application to the timbers and other woodwork of houses, they may be rendered comparatively safe from fire; but for important structures, the most thorough protection is in the use of wrought-iron beams, built into the walls of brick or stone, and of iron or other incombustible material for the partition walls, floors, roof, and stairs. The most efficient methods in use in the United States are described in the article Beam. Even buildings thus constructed in the most perfect manner be completely ruined if filled with combustible goods that become once thoroughly ignited; for the beams when heated must expand, and with a force against the walls, which is proportioned to their length. The wrought-iron beams and columns have been shown to be more objectionable even than wood; for on being heated they rapidly lose their strength, and are liable to give way suddenly, and much sooner than timbers even when consuming.

FIREWORKS. See Pyrotechny.

FIRKIN (Dan. fiire, four), the fourth part of a barrel, an old English measure of capacity, variously given as containing from 7 to 9 imperial gallons to 10-987 standard gallons. For ale its capacity was one gallon less than for beer; as usually reckoned, it was 8 gallons for the former and 9 for the latter. In the United States, firkin designates a tub, usually of butter, the weight of which should be 56 lbs. In some parts of Pennsylvania it is 110 lbs.

FIRMAMENT (Lat. firmamentum, support), in ancient astronomy, the eighth sphere or heaven which surrounded the seven spheres of the planets and supported the fixed stars. Two motions were attributed to it: the diurnal motion from east to west, and a motion from west to east, which was completed, according to Ptolemy, in 36,000 years, when the fixed stars were again in precisely the same position as at the beginning. This period was called the Platonic or great year. In common language, firmament signifies the sky or heaven.

FIRMAN, or FIRMAR, a Persian word signifying an order, employed especially in Turkey to designate any decree issued by the Porte, and authenticated by the sultan’s own cipher or monogram, called the tuea. Each of the ministers and members of the divan has the right of signing firmans relative to the business of his own department, but only the grand vizier is authorized to place at their head the tuea, which alone gives them force. A decree signed by the sultan’s own hand is called hatti-sherif. The name firman is also applied to a Turkish passport, whether issued by the Porte or by a pasha, enjoining the subordinate authorities to grant the traveller bearing it protection and assistance. In India, a written permission to trade is called a firman.

FISC (Lat. fiscus), originally, a wicker basket in which money was carried about and kept. Under the Roman republic the state treasury was called ararium. When the empire was established the name fiscus was given to the treasure which belonged to the emperor as much. The public treasury, properly speaking, the title to which was vested in the senate as the representative of the old republic, continued to be called ararium, and the private property of the emperor as an individual was termed rea privata principis. Under the later emperors no such separate fund as the ararium was any longer in existence, and the distinction between ararium and fiscus was lost. The imperial treasury, having become the only treasury of the state, was designated by both terms. Some of the rights of a natural person were accorded to the fiscus, and hence by a fiction of law it was treated as if it were a corporation or the community of a city or village. In the civil law of modern Europe the fisc is the property of the state.
Such property having often been obtained to a large extent from fines and the possessions of condemned persons, the word confiscation, derived from *fiscus*, signifies the forfeiture of any species of property to the state.

FISCH, George, a French Protestant divine, born in Switzerland, July 6, 1814. He was educated in the academy at Lausanne, and entering the ministry was for nearly five years pastor of a German-speaking congregation at Vevey. He then emigrated to France and joined the French Evangelical church. In 1846 he was called to Lyons as the successor of Adolphe Monod. In 1855 he removed to Paris to become pastor of the church "Taitbout," where he is the colleague of Edmond de Pressensé, who is his brother-in-law. Dr. Fisch advocates the independence of the church from the state. He is a director of the evangelical society of France, a powerful auxiliary to the union of evangelical churches, and since 1863 has held the presidency of the "Union."

FISCHARD, Johann, called Mentzer, a German writer, born probably in Mentz about 1545, died probably at Forbach in or after 1589. He was educated as a jurist in Worms, visited England, spent some time in Frankfort and Strasburg, became an advocate in the imperial tribunal of Spire in 1582, and held a public office at Forbach from 1585 to 1589. He was one of the most voluminous German writers of his day, excelling in satire, burlesque, and allegory. Among his works, which were published under various pseudonyms, are *Das glückhaft Schiff von Zürich* (1576; new but defective edition, 1829), and *Psalmen und geistliche Lieder* (Strasburg, 1576; new edition, Berlin, 1849). Wackernagel has published Johann Fischart von Strasburg, und Basels Antheil an ihm (Basel, 1869).

FISCHER, Ernst Kuno Berthold, popularly known as Kuno Faschera, a German philosopher, born at Ziegenaul, Silesia, July 23, 1824. He graduated at Halle, and taught philosophy at Heidelberg from 1850 to 1858, when he was suspended by the government of Baden, the reason not being assigned. He continued to reside at Heidelberg till 1855, when he went to Berlin, where permission to resume his profession was at first denied to him, but eventually granted in September, 1856, by the king at the instance of the university authorities. He had however already accepted a professorship at Jena, where he has since continued to be one of the most eloquent exponents of modern philosophy. His principal works are *Die Logik und Metaphysik, oder Wissenschaftslehre* (1852), and *Geschichte der neueren Philosophie* (1854 et seq.), with masterly delineations of the systems of Descartes, Spinoza, Leibnitz, and Kant. Fischer assumes for the period of transition from the ancient to the modern order, a new beginning, with the line of development of ancient philosophy, and states in the latter and most important of his works that "the modern mind seeks to find a way out of the theological conception of the world, with which it is filled, to the problems of cosmology." He has also written on Bacon, Schiller, and Shakespeare, *Geschichte der auswärtigen Politik und Diplomatie im Reformations-Zeitalter* 1489-1556 (Gotha, 1874), &c.

FISCHER, Gottfried, a Russian naturalist, born at Waldheim, Saxony, in 1771, died in Moscow, Oct. 18, 1853. After graduating as a physician at Leipsic and holding a professorship at Mentz, he settled at Moscow in 1806, lectured at the university and medical academy, founded a museum of natural history, and published upward of 180 works, including *Oryctologosie* (2 vols., Moscow, 1815-'20), *Oryctographie du gouvernement de Moscou* (6 vol., 1812, with 65 engravings, and translated into Russian), and *Entomographie de la Russie* (3 vols., 1820-'28), translated into Latin, German, &c.

FISCHER VON ERLACH. I. Johann Bernhard, a German architect, born in Prague or Vienna in 1650, died in Vienna, April 5, 1723. He acquired in Rome the style of Bernini, which was admired in Vienna, where he became the architect of prominent public buildings, including the palace of Schönbrunn and the church of San Carlo Borromeo. II. Joseph Emanuel, son of the preceding, born about 1680, died about the middle of the 18th century. He was ennobled in 1736, and excelled in the same style of architecture as his father. In 1727 he constructed the first steam engine in Vienna.

FISH, Hamilton, an American statesman, born in New York city, Aug. 3, 1808. His father, Col. Nicholas Fish, was a distinguished officer of the revolutionary army. He graduated at Columbia college in 1827, and was admitted to the bar in 1830. In politics he was a whig, and was repeatedly nominated by that party as a candidate for the state assembly, but was defeated by the democratic majority. In 1842 he was elected a representative in congress from the sixth district of New York. In 1844 he was a candidate for lieutenant governor. The whig candidate for governor, John Young, was elected, but Mr. Fish, who had incurred the hostility of the anti-renters by his warm denunciation of their principles, was defeated. But his successful competitor, Addison Gardiner, a democrat who had received the support of the anti-renters, resigned the office in 1847 on becoming a judge of the court of appeals, and Mr. Fish was elected in his place. In 1848 he was chosen governor by about 30,000 majority, and in 1851 he was chosen United States senator in place of Daniel S. Dickinson. In the senate he opposed the repeal of the Missouri compromise, and acted with the republican party from its formation to the end of his term in 1857. In that year he went to Europe with his family, and remained till shortly before the commencement of the Civil War. During that contest he contributed in money to the support of the government. In January, 1862, in conjunction with Bishop Ames, he was appointed by Secretary Stanton a commissioner to visit
the United States soldiers imprisoned at Richmond and elsewhere, "to relieve their necessities and provide for their comfort." The confederate government declined to admit the commissioners within their lines, but intimated a readiness to negotiate for a general exchange of prisoners. The result was an agreement for an equal exchange, which was carried out substantially to the end of the war. In March, 1869, Mr. Fish was appointed by President Grant secretary of state, and was reappointed by him at the commencement of his second term in March, 1873. On Feb. 9, 1871, the president appointed him one of the commissioners on the part of the United States to negotiate the treaty of Washington, which was signed by him on May 8 of that year. In November, 1873, he negotiated with Admiral Polo, Spanish minister at Washington, the settlement of the Virginian question.

**FISH CROW.** See Crow.

**FISH CULTURE,** or Pisciculture, the breeding and rearing of fish. The subject may be divided into two branches: 1, the rearing and fattening of fish in artificial ponds or lagoons; 2, the propagation of fish by the artificial impregnation of the spawn, which is the signification ordinarily attached to the term at the present time. The Chinese have been credited with being the first to practice fish culture, but their methods are such as are included in the first class only, and are confined to the practice of placing twigs in the water during the spawning season of the carp, and removing them when covered with spawn. These twigs, with their fertilized ova, have been sold in the markets, the purchaser placing them in ponds, or ditches, to hatch. This is as far as the Chinese seem to have advanced in this art, and it is a matter of doubt whether they were at all superior to the Romans in it. The latter, according to Oppian ("Halieutika," book i, v. 75 to 95), caught very young fish and placed them in ponds, where they were fed liberally and were taken out when full grown to grace the patrician tables, or were preserved in ponds to be angled for by the Roman nobles. The pictorial relics of ancient Egypt show that large vivaria were built and maintained for the purpose of growing fishes either for the table or for religious sacrifice to deities whom they wished to propitiate. This custom of growing fishes for religious purposes is mentioned by Martial. Ælian tells of some which were kept in a stew and dedicated to Jupiter Miliat. Diodorus Siculus records a reservoir near Gergenta, in Sicily, of several miles in circumference, which was fed with fresh water and stocked with fish; this was built for the tyrant Gelon. The ponds of the Romans, according to Pliny and Columella, were of the most expensive and complete construction. The former tells how Hortensius was more anxious about the welfare of his mullet than of his men, and that his fish-secreants were so numerous that they were not to be counted. He had sailors to procure food for them, and, when the weather did not permit them to go out, a troop of butchers and provision dealers sent in estimates for supplying his fish with provender. There was an overseer, or "nomenclator," who received a high salary and whose duty it was to give the fish their individual names and teach them to "walk their tails, fawn like dogs, and permit themselves to be scratched and ciaed" when he exhibited them to visitors. These stews seem to have been kept more for ornament than profit, for Varro says: "My friend Hortensius would much sooner lend you the carriage-horses from his stable to go and buy mullet where you liked than send and procure you one out of his own ponds. It often happens in his house that, when fish are wanted, in place of levyng them from his costly stews, he will send to Puteoli for supplies." It is recorded that when Cæsar wished to entertain his friends on fish he could only obtain from C. Hirtius 600 lampreys, on the express condition that they were a loan to be repaid on a certain day, not in specie, but in weight and kind. There is undoubtedly much fable concerning the affection of the ancient Romans for individual fishes, but the fact that they reared them is well established. In Italy the growing of the eel is carried on extensively in the lagoons of Venice, at Comacchio, and elsewhere, in connection generally with other species, such as mullet and plaice. This industry at Comacchio is as old as the 13th century. The precise date when the lagoon was formed into a fish-pond is not known, its earliest record being 1229. The lagoon at this place is situated between the Reno and Volano branches of the Po, and is divided into numerous sections, the principal entrances into which are from the two mouths. Its waters are diked out from the Adriatic, which, however, communicates with the lagoon through the Grand Palotta canal and its branches. Flood-gates control the various entrances and regulate the migration of the fish. The ascent of the young eels from the sea begins early in February, and continues until the end of April, when the flood-gates are closed. The harvest commences early in August, and continues till December. During the interval from their ascent until the close of the season the fish are carefully fed. At Bizerta, in Tunis, a small stream running into the sea has been widened just above the town into a shallow pond of 60 to 100 acres. The water is at no time much above the level of the sea, which occasionally flows back into the pond. The greater portion of the area is divided into 12 compartments by a cane fence, which separates the fish, but does not prevent the circulation of the water. Each compartment is said to contain a different kind of fish. The pond is under municipal control, and officers are appointed to manage it. The fish are said to be taken for an entire month from the same compartment, while the rest is left undisturbed for the next 11 months. The profit to the town
amounts to $12,000 or $15,000 a year.—These are examples of fish culture as practised in former times, and do not include what the modern culturist considers the finest portion of his work, the taking of the eggs from the female fish, impregnating and hatching them. This art was discovered in 1741 by Stephan Ludwig Jacobi, a wealthy landed proprietor of Holhenhausen, in the duchy of Lippe, in northwestern Germany, when a youth of seventeen years. His discovery was not made known to the public until 1768, when a writer in the Hanoverian magazine published his methods. French writers have ascribed the discovery to Dom Pinchon, in 1420, but there is no evidence that he did more than to transplant eggs which he found already fertilized. In 1771 George III., of England, recognized the importance of Jacobi's work and granted him a life pension.

In 1820 operations in France were begun by MM. Ilivert and Planchon, in Hante Marne, and four years later the art was introduced into Bohemia. In 1837 Mr. Shaw, in Scotland, practised artificial impregnation for the purpose of restocking the streams with salmon; and in 1841 Boccius, a civil engineer of Hammersmith, practised the art with trout on various estates. The following year Joseph Rémy, a fisherman of La Bresse, in the Vosges, it is claimed without knowledge of the labors of others, resorted to artificial impregnation as an adjunct to his business, restocking the Moselle and other streams from which he gained his livelihood. His operations, brought to the knowledge of Prof. J. J. C. Coste of the college de France in 1849, gave an impetus to fish culture in Europe. The art was then confined to trout and salmon, and their method was to capture the fish and select those which were ripe, or about to spawn. This state was apparent by certain signs, as, softness of the belly and protrusion of the vent, with its purple color, in the females; and by the high color of the males. A female trout was taken in the left hand, and, by gently stroking the abdomen, the eggs were caused to flow into a pan of water. The male was handled in the same manner and a few drops of milt expressed, which impregnated the eggs. The latter were then placed in troughs on fine, clean gravel, and a stream of cool water allowed to flow over them until they hatched. This system was improved by M. Co-te, who, at Hingen, in Alsace, adopted traps or troughs of earthenware, 25 in. long, 5 in. wide, and 4 in. deep, for hatching. The eggs were placed on grilles, formed of small parallel rods of glass arranged in a wooden frame resting on projections on each side of the tray, a little below the surface of the water, the bars being near enough together to hold the eggs while the dirt and the young fish when hatched fall between them and are removed through an aperture in the bottom of the tray. These trays were placed in shallow vessels, each a little above the other like steps, the water entering from a small jet at one end of the upper trough and passing out at the other, traversing each trough in succession. This was further improved upon by Mr. C. G. Atkins, of Bucksport, Me., in 1871. He abolished both the gravel and the grilles, and used frames with bottoms of wire-cloth, which were coated with coal or gas tar, lined with spirits of turpentine, to prevent rusting. This preparation is also used on all the wood-work which comes in contact with the water, and prevents exudation from the wood and is unfavorable to fungoid growths, while it imparts no taste to the water, if properly dried before using. Atkins placed several frames on each other, and thus multiplied the hatching capacity of troughs. In 1856 Mr. V. P. Vrasski, a Russian, discovered the method of dry impregnation and published it in the following year. This process consisted in taking the eggs in a pan in which the milt has first been placed, after dilution with a little water. This was published in the Bulletin de la Société d'Acclimatation, Paris, August, 1877, and translated in America by Mr. G. S. Page. Mr. Atkins also improved this method in 1871 by using no water until each egg had been placed in contact with the milt and had a chance to absorb it, undiluted. This gives a larger percentage of impregnation than when the milt is diluted. The trout egg will absorb liquid for nearly half an hour, after which, when fully distended, if it has not received a spermatozoön from the male, no power can impregnate it. Mr. Atkins published his account of this method in the Report of the U. S. Fish Commissioner for the years 1872-3, p. 289.—The first fish hatching in America was done by Dr. Theodatus Garlick, near Cleveland, Ohio. In company with Prof. H. A. Ackley, in August, 1853, parent trout were obtained, the eggs extruded on the 21st of November, fertilized and hatched in January, 1874.—TROUT PONDS SHOULD BE SMALL if the object is to obtain many eggs or to feed and grow the fish. Fish can then readily be seen. Except in a few instances, as the South Side Sportsmen's Club of Long Island, where a great supply of water was found near where food can be cheaply obtained, trout culture for market has not been profitable, the time and labor being too great for small operations, or the expense of food too great for larger ones. It has paid in many cases to stock waters where the fish could have a large range and find their own food. Artificial hatching produces many fold more fish than are hatched in a state of nature; there is a much greater impregnation, and the eggs are protected from enemies, such as sunlight, sediment, and the numerous things which eat them, including fishes, birds, reptiles, insects, and mammals. During the process of hatching, all fertilized eggs are examined daily to see that the flow of water is sufficient, and to remove defective eggs. The added eggs turn milk-white, and are easily seen among the transparent ones, which somewhat resemble amber. Under the old system of hatching on
gravel there would be some dead ones which would escape observation in it, and which would develop a fungous growth; hence the older writers on the subject regarded "byssin" as the deadliest foe of the fish breeder. With the present system of wire trays it must be a careless fish culturist who allows it to be present in his troughs. The period of incubation of trout eggs varies with the temperature. At 87° it is 163 days; at 90°, 121; at 41°, 103; at 44°, 81; at 48°, 66; at 50°, 47; at 53°, 38; and at 54°, 32 Fahr. When the trout are first hatched they have an umbilical sac, about three times the size of the body, which furnishes them sustenance for a period varying, with the temperature of the water in which they are hatched, from 77 days at 89°, to 60 at 40°, 46 at 45°, and 30 at 50° Fahr. When the sac is absorbed they require food, which may consist of curd, fresh shad, herring or other fish, roe, raw or boiled, the yolks of eggs boiled hard, consolidated blood, liver raw or boiled, &c., which should be the fine. When they outgrow the hatchings troughs, they are let into the nurseries, and should be furnished with sunlight. For the adult trout similar food will suffice, maggots bred in decaying meat being perhaps the most nutritious. One great advantage of artificial breeding consists in the large proportion of eggs and fry that are saved from destruction. In the natural state these are the prey of frogs, aquatic birds, various species of fish, and numerous water insects. Fecundated ova, after the first formation of the fish is seen, may be transported without injury, if packed in moist moss in a box which is inclosed in another with the space between filled with sawdust or other non-conducting material. They are also placed on trays having canton flannel bottoms. These trays are placed above each other in a tin box, which is surrounded by ice. In this way the U. S. Fish Commission has sent hundreds of thousands of the eggs of the Californian salmon, land-locked salmon, trout, and white-fish to Europe. At a temperature from 5° to 15° above freezing point they may be kept packed for two weeks; and even after the lapse of six weeks they have been found uninjured. The fry and adult fish may be transported in barrels or smaller vessels, care being taken to change the water and have it properly oxygenated. The spawn of salmon requires a somewhat longer period of incubation than that of trout in water of the same temperature. The spawn of shad is hatched in 72 hours in water at a temperature of 75°, and in seven days when the temperature is 60°. The umbilical sac sustains the fry only from three to six days. The original shad-hatching apparatus is a box with a bottom of wire gauze, sustained in the water by two float bars fastened to the sides at an angle with the top. This is anchored in the stream, in a gentle current which passes freely through the gauze and buoyed up the eggs within. When hatched, the fry are liberated in mid-stream, the young shad instinctively seeking the main current, where they are comparatively free from the small fish most likely to devour them. The eggs after life is observed in them have been kept at a low temperature for six days when packed in damp moss, and it is possible to transport them a long distance. The spawn of both shad and salmon is obtained in much the same manner as that of trout. An important improvement in shad hatching was discovered by Mr. Fred Mather, in 1875. It consists of a cone which admits the water at the bottom and allows it to flow out at the top, with a screen at both places. The eggs of shad require to be buoyed up by a current of water and kept in motion, a requirement met by the cones, which render it possible to carry on the work of hatching on shore, or on board a vessel. Mr. T. B. Ferguson, in 1877, devised a system of plunging buckets, to be worked by steam, by the side of a vessel, which were extensively used by the U. S. Fish Commission. They kept the eggs in motion by alternately lifting and dropping the cylinders with wirecloth bottoms, which contained the eggs, into the water. The "Universal" hatching jar, invented by Col. M. McDonald, is, with the Mather cones, now used in all the shad-hatching operations of the U. S. Fish Commission, the former in the central station at Washington, and the latter on the steamer Fish Hawk. Shad have not only been increased in the rivers to which they are native, but have been successfully established in the rivers of California, and specimens have been taken in the upper Mississippi, Ouachita, and other streams where they have been placed. The French government early gave its patronage to fish culture, and the barren waters of the country have been stocked with appropriate fish: the rivers with salmon, the brooks with trout, and the sluggish streams, lakes, and ponds with carp, perch, eels, and pike. The establishment at Hüningen was erected under the patronage of the government through the exertions of Prof. Costa in 1832. The buildings form a square comprising at the sides two hatching galleries 65 yards long and 95 yards wide, containing tanks and egg-boxes. The buildings and ponds cover 80 acres. The water is supplied from springs on the ground, from the Rhine, and from a small stream called the Augraben. The establishment does not in general breed fish except by way of experiment, the chief business being the collection and distribution of eggs, which are brought mostly from Switzerland and various parts of Germany, and embrace those of several species of trout, the Danube and Rhine salmon, and the ombré chevalier. The commonest fish is the fera, similar to the white-fish of the United States. The spawn collected from various sources is carefully tended until it is sent to some point in need of it. With the cession of Alsace and Lorraine, this establishment passed into the hands of the Germans, and is now
conducted on a still larger scale under the auspices of the German fishery association; and success has attended the efforts to restock the Rhine and other streams. In its stead the French government have established another at Montbéliard, in addition to those already in operation at Clermont-Ferrand and elsewhere.

—The German fishery association (Deutscher Fischerei Verein) is a body of able and influential men, comprising some of the foremost men in the German parliament. It has done much to advance the cause of fish culture, not only within the empire, but its influence has been felt in all parts of Europe. In England but little has been done except among wealthy gentlemen, wholly as a pastime or for an ornament to parks. In 1882 the National Fish Culture Association was formed, with Hon. Edward Birbeck, M. P., as president, and W. Oldham Chambers as secretary, with permanent headquarters at the Exhibition Grounds at South Kensington, and the association is rapidly growing. It is awakening an interest in the subject which may cause the government to do something for fish culture. The association is about to begin practical operations at an experimental station, leased for the purpose, where both native and foreign fishes will be bred. An aquarium with both salt- and fresh-water tanks has been erected in the South Kensington Museum, where the habits of fishes will be observed. The English government has not made any appropriation for this purpose, but the inspectors of salmon fisheries, whose principal duty is to preserve the streams from over fishing or from fishing at unlawful times, have interested themselves somewhat in fish culture. The late Mr. Frank Backland established what he called a "Museum of Economic Fish Culture" at South Kensington, which was mainly a collection of plaster casts of fishes. He sent spawn of salmon and trout to Australia, as did other fish culturists. In Scotland, more attention has been paid to the subject than in England. The salmon-breeding establishment at Stromontfield on the Tay, about five miles above Perth, has been in operation since about 1850. The result of the operations there has been a large increase in the numbers of salmon taken in the Tay, and in the rental of its fisheries. There is also an establishment at Tongue on the Dee, where the hatching boxes are protected from the weather, occupying a room 70 ft. long in a lumber storehouse connected with a bakery. Sir James G. Maitland, Bart., has since established a hatchery and ponds on a larger scale at Howetoun, near Stirling. Several successful attempts at fish culture have been made in Ireland, notably by Mr. Ashworth on the Galway, and by Mr. Cooper on tributaries of the Ballisodare, those rivers having been stocked with salmon, and stairways having been built to enable the fish to ascend falls before impassable. Salmon have also been introduced into the Doohulla river, so called, which consists of several small lakes, originally connected with the sea by a tortuous brook, impassable by fish unless swollen by heavy rains, when white trout occasionally ascended. The upper lakes have been connected with the lower one by an artificial cut, and this by another artificial channel with the sea, so that the waters are accessible to salmon. The most noteworthy Norwegian experiment is that of Prof. Rasch, of the university of Christiania. The locality is a deep fjord, which runs up into the land about a mile, narrowing at the end to the width of a large trench, and opening out beyond into a basin about 800 acres in extent, with an average depth of 40 ft. Across the inlet Prof. Rasch in 1869 erected a fence which does not prevent the ebb and flow of the tide, but bars the outward passage of the fish. Within the enclosure a hatching apparatus for salmon and sea-trout spawn was set up, connecting with two small fresh-water ponds, supplied by a spring. The young fish are fed for a time in the ponds on fine-chopped mussels, which are found in the basin in abundance, and are then turned into the salt-water basin. This experiment has shown that sea trout may be reared without access to the sea. In the United States fish culture stood still after the experiments of Dr. Garlick, in 1886, until Mr. Stephen H. Ainsworth, of West Bloomfield, N. Y., began it on a small scale about 1888. This attracted the attention of Mr. Thaddeus Norris, of Philadelphia; Mr. Seth Green, of Rochester; Mr. Livingston Stone, of Charleston, N. H.; Mr. Fred Mather, of Albany; and others who embarked in it. At first it was confined to brook trout entirely, and, as the business obtained a notoriety through the newspapers, the pioneers turned their attention to supplying eggs and fry for stocking ponds, that being more profitable than raising the fish. Trout ponds sprang up all over, but it was found that only in exceptionally favorable localities could it be made profitable. The cost of food and attendance was so great that no margin of profit was left. The exceptions were where the fish could find abundance of natural food, as in streams emptying into lakes, and on Long Island, where the trout can run down into salt or brackish water and get an abundance of food. Legislative action was first taken by the New England states, which were followed by others, until now commissioners of fisheries exist by law in 34 states and territories, viz.: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Virginia, Alabama, Ohio, Michigan, Illinois, Indiana, West Virginia, Tennessee, Georgia, North Carolina, South Carolina, Missouri, Arkansas, Nebraska, Kansas, Texas, Minnesota, Iowa, Colorado, Utah, California, Nevada, Wisconsin, and Kentucky. Canada has a commission which looks after the fish-cultural interests and has done much good work in restocking exhausted rivers. The efforts of these commissioners have been
directed entirely to the restocking of rivers and ponds, to the erection of fishways around falls and dams, and to the enacting of protective legislation forbidding the taking of fish during the spawning season, and regulating the use of nets and the more destructive means of capture.—By the act of congress of Feb. 9, 1871, a United States commissioner of fish and fisheries was provided for, whose duty it was made to prosecute investigations, with a view of ascertaining whether any and what diminution in the number of the food fishes of the coast and lakes had taken place, and to what cause such diminution was due, as well as what remedial measures, if any, should be adopted. Prof. Baird, of the Smithsonian Institution, was appointed commissioner. Under his management the treatment of fish culture has extended to marine fishes as well as to those living in and entering fresh waters. Experiments have been made with several kinds of marine fishes, such as the cod, the pollock, the moon-fish (Parophiupus faber), and the Spanish mackerel (Olybium macula)um.—The steamer Fish Hawk was built for the U. S. Fish Commission and fitted up with hatching cones and buckets for work on shad rivers and for hatching sea-fish in harbors, thereby enabling one set of machinery to be of use at different times at widely different places. Among the other triumphs of the U. S. Fish Commission is the introduction of the German carp, which were brought over in May, 1877, by Dr. R. Hessell, acting for Prof. Baird. He brought 327 carp of the mirror and leather varieties, and 118 scale carp, which were placed in the ponds of the Maryland Commission, at Druid Hill Park, Baltimore. In the same year the national carp ponds were established near the “Monument lot,” Washington, D. C., and many acres of swampy, unwholesome land were turned into large and handsome ponds. The carp grew faster than in their native land, and at three years old some specimens weighed 12 lbs. This fish, from its quiet habit, its vegetarian diet, and its love of warm, sluggish water, combined with its rapid growth, has become a great favorite in regions like the inland and southern states, where the conditions are favorable to its growth, and where there are no other good table fish. Although many thousands of young, from 2 to 3 in. in length, have been sent to almost every state in the Union for the past two years, the demand yet exceeds the supply. They have thriven in all waters where they have been placed, where it has not been too cold, but they grew faster in the South, where the winters are milder and the period of hibernation is shorter. Their growth only continues through the hottest weather, and in waters often so tepid as to be too warm for them. Their culture is simple; their eggs are glutinous and are attached to weeds where they hatch, no manipulation being necessary. They can be turned into ponds and left to increase in their own manner, or they may have

a breeding pond prepared into which they may be driven at night and turned out of it in the morning, so that the young of the previous brood may not eat the eggs deposited. This breeding pond may be merely a shallow portion of the main pond, and should not be over 2 ft. deep. Carp are easily sent from one part of the country to the other without an attendant. Mr. E. G. Blackford, of Fulton market, New York, and a member of the N. Y. Fish Commission, has sent them in cans by steamer from New York to Florida safely. In May, 1881, the same gentleman sent out thirty carp to Ecuador in a steamship. They were destined for the plantation of Signor Jijon near Quito, from which place they were carried on the backs of men a ten days’ journey over the mountains before reaching their destination. The heat is intense there, and the attendant was instructed to aerate, but not change the water. They arrived safely and were deposited in ponds, and have bred.—The following works on fish culture have been published in America: “A Treatise on the Artificial Propagation of Fish,” by Theodatus Garlick, M. D. (Cleveland, 18, 1888; a second edition, 1880); “Artificial Fish-Breeding,” W. A. Fry (New York, 1866); “American Fish Culture,” Thaddeus Norris (Phila., 1868); “Trout Culture,” Seth Green (Caledonia, N. Y., 1870); “Domesticated Trout,” Livingston Stone (Boston, 1872; a third edition, 1877); “Practical Trout-Culture,” J. H. Slack, M. D. (1877); and the Reports of the U. S. Fish Commission for 1871–72; 1873–74; 1873–75; 1875–76; 1877; 1878; 1879; 1880; 1881; 1882; together with the Bulletin of the U. S. Fish Commission, a yearly volume begun in 1881 and continued each year; the reports of the different state commissions, mostly annual. In addition to this, all news relating to fish-culture is published weekly in a department of a weekly journal (“Forest and Stream,” New York). The annual meetings of the American Fish Culturists’ Association, organized 1873, and of the Central Fish Cultural Society at Chicago, organized 1879, attract much attention, and valuable papers are read at each which are published in their reports.—On the first day of April of each year, the date when it is lawful to catch or sell brook trout in the state of New York, a grand display of cultivated trout is made in Fulton market, by Mr. E. G. Blackford, of the first-named association. Trout are sent from all the Eastern states and from California and Nevada, as well as specimens obtained from Europe. This display attracts not only fish culturists, but people of all conditions, to see the beautiful exhibit.—A notable event in the fish cultural history of the world was the International Fishery Exhibition at Berlin in 1880. This exhibition, though general in its scope, covering everything obtained in any manner from the water, was intrinsically an exhibition for fish culture, and was under the management of the Deutsche Fischerei Verein. Congress appointed Prof. S. F. Baird as commissioner for
the United States to the exhibition. It being impossible for him to attend it, he deputized Prof. G. Brown Goode in his stead. The latter selected as his staff Fred Mather, fish culturist; F. W. True, custodian; Capt. W. J. Collins, fisherman; and J. Palmer, taxidermist. The grand prize was awarded to Prof. Baird for the best collection illustrating the fisheries, and the following countries took prizes in the department of fish culture:

Since this exhibition, which opened March 20th, and closed June 20, 1880, there have been several local fishery exhibitions held in Germany, and a national one at Norwich, England, in April, 1881, an international one in Scotland, at Edinburgh, in 1882, and a grand international one at London, 1883. This latter was the largest of any yet held, and the United States again carried off the first prize for the most complete exhibit; Prof. Goode again had charge of the American collection, which was largely made from the National Museum at Washington.—The fact that the eggs of different species of fish differ so much in their character as to require entirely different treatment makes the fish culturist approach a new species with caution. The treatment that will hatch a salmon egg will kill the ova of a cod or a shad. All the salmon family, except the smelt, have eggs which are free from each other and are laid in the gravel. The eggs of the smelt, like those of the herring, alewife, carp, and many cyprinoids, are free from each other, but have a mucous coating, which adheres to what they first come in contact with. The eggs of the shad require to be buoyed in water, while those of the cod float. Others, as the yellow perch, lay them in long strings, over twigs, and the eggs of the “silver-sides,” or “friar” (Chirostoma notata), and of the “silver gar” (Belone longirostris), have threads that attach to objects in the water; the sticklebacks have a button-shaped appendage on one end of the egg which is attached to the egg membrane. There are still other modes of reproduction among the bony fishes, for the viviparous perch (Embiotocidae) of California bring forth their young alive, and the little cyprinodonts (killy fish) and the sole-pout (Zoarces anguillaris) are more or less viviparous. The cyprinodonts copulate, but whether they lay eggs or hatch them before extrusion is not yet definitely known. See Reports of the U. S. Fish Commission; Circulaires of the Deutsche Fischerei Verein; Die Fischwacht, by Max von dem Borne (Berlin, 1881); “American Fish Culture,” by T. Norris (Phila., 1868); “Artificial Propagation of Fish,” by T. Garlick (Cleveland, 1881); Instructions sur la pisciculture, by Prof. Costa (Paris, 1856); Multiplication artificielle des poissons, by J. P. Koltz (Brussels, 1858); “Ancient and Modern Fish Tattle,” by C. D. Badham (London, 1864); “Epochs in Fish Culture,” by Prof. G. Brown Goode (“Forest and Stream,” 1881); “Harvest of the Sea,” by J. G. Bertram (London, 1865 and 1869; New York, 1869); “The Sea and Its Living Wonders,” by Dr. G. Hartwig (London, 1866); “Artificial Fish Breeding,” by W. H. Fry (New York, 1886); La boutique de la marchande de poissons, by Martial Doherryn (Paris, 1867); “Practical Trout Culture,” by J. H. Slack (New York, 1877); “Fish Hatching and Fish Catching,” by Roosevelt and Green (Rochester, N. Y., 1879); An Essay on Fish Culture, by John H. Klippart (Columbus, O., 1879); “Domesticated Trout,” by Livingston Stone (Boston, 1877); also the annual reports to the Canadian government, and the proceedings of the American fish culturists’ association, and of the Société d’Accultération. The most important invention yet made in the apparatus for the propagation of fishes is the fishway invented by Col. M. McDonald, of the U. S. Fish Commission, which can be built on a steeper incline than any other, and is so arranged that at the sides the water actually runs up the inclined chute. These fishways are now in operation on the Oswego river, New York, and on the Savannah river, Ga., and one will soon be built at the Great Falls of the Potomac. Very little has been done in a practical way with the eggs of sea fishes beyond the experiments referred to above. At Gloucester, Mass., a few cod-eggs were hatched by Capt. H. C. Chester, of the U. S. Fish Commission, in 1879, in a semi-rotating cylinder devised by him. Since that time the Commission has established itself permanently at Wood’s Holl, Mass., for summer investigations and for experiments in fish culture at all seasons. Capt. Chester found great difficulty in keeping the eggs floating on account of sediment attaching to them, and his last device is a bottomless frame, three feet deep, six feet long and two feet wide, set in a water-tight tank. The corners of this inside frame are rounded, and four jets about a foot below the surface of the water cause a continuous current in one direction, the water escaping below, and the eggs either floating or are submerged a few inches. Large ponds have been made to store sea fishes in.—At Cold Spring Harbor, on the north shore of Long Island, the New York Fish Commission has a station. Here, in addition to the fresh-water work with salmon, trout, white-fish, smelt, etc., there is a large pond, with a flood-gate to hold the tide at low water, from which an engine pumps one thousand gallons per hour into a reservoir on the hill above. From this upper reservoir pipes lead into the hatchery, and to the McDonald jars and Chester cod-hatchers. Owing
FISHER

223

to storms in December, 1884, the main spawning season of the cod, a later run of fish spawning in April, no eggs were obtained, but many thousands of tomcod, Microgadus proximus, were hatched and liberated. The eggs of the tomcod are heavier than those of the cod, and can be hatched in any form of jar or cone which is used for eggs that do not float; they hatch in twenty-six days at temperatures varying from 36° to 48° Fehr. The tomcod spawns in November and December along the docks and among the stones. It sometimes grows to a foot in length, but averages about six inches, and is highly esteemed. It is the intention to experiment with all the edible salt-water fish whenever their eggs can be obtained. Two attempts have been made to introduce the turbot and the sole from Europe into American waters, and a few were planted, but the number was too small to expect any success from. Now that large ponds of salt water have been made at Wood's Hill and Cold Spring Harbor, they can be better cared for and turned out at the proper time. No attempts have ever been made to breed any of the flat fishes artificially, but little is known of their spawning habits, or of the character of their eggs. Nothing marks the rapid progress in the breeding of fishes more than the exchange of species between Europe and America, and the very great increase of the number of publications that relate to fish culture.

FISHER, a carnivorous digitigrade mammal, belonging to the family Mustelida, subfamily Martina, and genus Mustela (Linn.); this animal (called also Pennant's marten, black cat, and pakan) and the pine marten are the only two species of the genus found in North America. The fisher (M. Pennantii, Erx.), is the largest known species, the length of the body being over 2 ft., and the tail 1½ ft. The dental formula is: incisors 1 1, canines 1 1, premolars 3 3, molars 3 3 = 34, 88 in all; the lower carnivorous tooth has a rounded lobe on the inner side, indicating a less sanguinary disposition than that of the weasels. The general appearance is fox-like; the head is long and muzzle rather pointed; the ears short, rounded, and wide; the eyes large; body slender; tail long and bushy at the base; feet short, stout, and armed with strong sharp claws, five on each foot; no anal pouch, but a small gland which secretes a musky fluid. The fur is of two kinds, the outer long and coarse, the inner fine and soft. The general color is blackish, with a grayish tinge on the head and shoulders; some specimens are brownish, and a few with light tints; there is sometimes a white spot on the throat. Specimens vary so much in size and coloration that it has been supposed that two species are confounded under the name. A specimen measuring 28 in. in length of body, with the tail 14 in., would weigh about 8½ lbs. Occasionally seen in Pennsylvania and New York, and even as far south as North Carolina, it is common in Canada and in the Lake Superior mineral region; it is found as far north as lat. 68°, and across the continent to the Pacific. It is eminently an arboreal species, very agile, though less so than the squirrel, which it is fond of pursuing; it is generally nocturnal in its habits; it preys upon hares, raccoons, squirrels, grouse, mice, and any small bird or quadruped which it can seize. Though called fisher, there is no certain evidence that it catches fish, but it is fond of the fish with which the hunter baits his traps for the pine marten; in this respect the fisher is a great nuisance, as it breaks into the traps from behind, sometimes robbing every one in a line of miles, escaping itself and preventing the capture of the more valuable pine marten. Fishers have been often kept in confinement, where they become docile if taken when young; but the temper is very changeable, and they quickly become angry without apparent cause. From their agility, strength, and ferocity, they are difficult to obtain unless severely wounded. Like the other fur-bearing animals, the fisher's pelage is finest in winter and in high latitudes; a skin is worth about $1 50, while that of the smaller pine marten is worth $3 50; their fur is not much used in the United States, but is generally sent to Europe, where it is used for linings of more costly furs, for trimmings, and for robes. It brings forth its young once a year toward the end of spring, from two to four at a birth, depositing them in hollows in trees at a considerable height above the ground. This animal is called by Schreber M. Canadensis.

FISHER, Alva, an American artist, born in Needham, Mass., Aug. 9, 1792, died in Dedham, Mass., Feb. 16, 1863. He began the study of painting at the age of 16, with an ornamental painter of merit named Pennyman. In 1814 he commenced his professional career as a portrait painter, and soon after undertook barnyard scenes, winter pieces, portraits of animals, and in general scenes belonging to

Fisher (Mustela Pennantii).
rural life in which cattle are prominently introduced. He subsequently returned to portrait painting, which he practised for many years in Boston.

FISHER, George Park, an American scholar, born in Wrentham, Mass., Aug. 10, 1827. He graduated at Brown university in 1847, and studied theology in the divinity school of Yale college and in that at Andover, Mass. In 1863 he visited Germany, where he continued his theological studies. He was appointed professor of divinity in Yale college on his return from Europe, and, in connection with his professorship, he was ordained as pastor of the college church, Oct. 24, 1854. After a period of seven years he resigned his office, and in 1861 was elected professor of ecclesiastical history in Yale divinity school. The degree of D.D. was conferred upon him by Brown university in 1866. He has been a frequent contributor to the "New Englander," of which quarterly he has since 1856 been one of the editors. In 1865 he published a volume entitled "Essays on the Supernatural Origin of Christianity, with special reference to the Theories of Renan, Strauss, and the Tübinger School" (enlarged ed., 1871). He delivered in 1871 a course of lectures at the Lowell institute, Boston, on the reformation, and from these resulted a volume on the "History of the Reformation" (1873).

FISHER, John, an English prelate, a zealous opponent of the reformation, born in Beverley, Yorkshire, in 1459, beheaded June 22, 1555. Having become the confessor of Margaret, countess of Richmond, he induced that lady to found St. John's and Christ's colleges at Cambridge. In 1501 he became chancellor of that university, and in 1504 bishop of Rochester. He has been supposed to have written the treatise "Austic sermorum memoratorum," for which Henry VIII. obtained the title of "Defender of the Faith." Though long favored by the king, Fisher fell under his displeasure by his opposition to the divorce of Catharine of Aragon. On the question of the king's spiritual supremacy being broached in 1531, the bishop firmly refused to acknowledge it. He further fell into disfavor, and was arraigned for misprision of treason, for concealing certain prophecies of Elizabeth Barton, called the holy maid of Kent, respecting the king's death. For this offence he was condemned to imprisonment during the king's pleasure, but was released on paying a fine of £800. Refusing to take the oath of allegiance in 1534, he was committed to the tower, attainted, and his bishopric declared vacant. Pope Paul III. took the opportunity to create him a cardinal; but Henry having sent Cromwell to interrogate him with regard to the appointment, and being informed that he would accept the cardinal's hat, exclaimed: "Mother of God! he shall wear it on his shoulders then, for I will leave him never a head to set it on!" The aged bishop was at once condemned on the charge of denying the king's supremacy, and was beheaded. He wrote a commentary on the several psalm titles, sermons, and controversial and devotional treatises. His life has been written by the Rev. J. Lewis (2 vols. 8vo, London, 1864–5).

FISHERIES, the business of catching fish, and the localities frequented by the kinds of fish that are objects of capture, such as the cod, herring, mackerel, and salmon. The whole fishery and the seal fishery are terms employed to designate the pursuit of the whale and the seal, though those animals are not fishes. (See Whale fisheries, and Seal fishery.) — Among the ancients, fisheries were carried on extensively from a very early period, and formed a valuable branch of industry. Byzantium (the modern Constantinople), and Sinope on the Black sea, were famous for their lucrative fisheries. From Susestonius we learn that the murena or lamprey, the favorite fish of the Romans, was caught in the greatest abundance in the sea around Sicily, and in the Carpathian seas between Crete and Rhodes. In the 5th century of our era the fishermen of the Mediterranean pursued their prey not only on the coasts, but in the open sea, making long voyages, and even passing the pillars of Hercules. The fisheries of Egypt were especially celebrated for their productiveness, but they were all inland, in lakes, canals, and the river Nile. The revenues arising from the fisheries of Lake Moris were given to the queen of Egypt for pin money, and are said to have amounted to nearly $500,000 annually. — The earliest mention of the herring fishery that has reached us dates from A. D. 709. The cod fishery began to be regulated by legislation in western Europe toward the end of the 9th century. From an ordinance of Charles VI. in 1115 it appears that the mackerel fishery of France at that period was very extensive, and that the fish were sold at an extremely low rate in the markets of Paris. The development of the fisheries during the middle ages was greatly promoted by the demand for fish created by the fasts of the church. But the discovery, at the end of the 15th century, of Newfoundland and its fisheries, which to this day surpass all others in magnitude and value, gave the greatest impulse to the business. The cod, mackerel, and herring are the chief objects of pursuit, and their range is not limited to the neighborhood of Newfoundland, but they are caught in vast numbers on the coast of New England, in all the bays and inlets of the British maritime possessions, and on the coast of Labrador. The French were the first Europeans who engaged in the American cod fishery. They visited Newfoundland as early as 1604. In 1608 Thomas Aubert made a fishing voyage from Dieppe to the gulf of St. Lawrence, and after that the Newfoundland fisheries increased so rapidly that in 1517 they gave employment to 50 vessels from different nations, chiefly, however, from France. In 1677 there were 150 French
vessels engaged in the business, which they pursued with great success. A few years later the government of Henry IV. took active measures to protect and encourage the cod fishery. Early in the 17th century, however, the business began to decline, so that by 1755 the number of French vessels employed in it was 50 less than in 1757. At this period began those contests between the French and English about the sovereignty of the fishing grounds, which continued more than a century. After the treaty of Ryswick in 1697, the French claimed the exclusive ownership of the American fisheries east of the Kennebec river in Maine, except on the W. coast of Newfoundland, where, by a specific stipulation of the treaty, the English were permitted to fish. By the treaty of peace of 1718, however, the French fishermen were prohibited from coming within 30 leagues of the coast of Nova Scotis, but they were granted the privilege of fishing on the E. coast of Newfoundland, from Cape Bonavista to the northern point, thence along the western shores as far as Point Riche. Notwithstanding the restrictions of this treaty, the French continued to pursue the fisheries with energy and success. They settled on the island of Cape Breton, where they built the town and fortress of Louisburg, at an expense of 30,000,000 livres, which became the great rendezvous of their fishermen. In 1721 their fleet of fishing vessels is said to have increased to 400 sail, a greater number than at any former period. In 1744 they had 564 vessels, manned by 27,500 men, and producing 1,441,500 quintals of fish, valued at $4,500,000. After the fall of Louisburg in 1748 the fleet declined to about 100 sail. By the treaty of Paris in 1763 it was agreed that the French should have the liberty of fishing and drying fish on a part of the coasts of Newfoundland, and of fishing in the gulf of St. Lawrence at the distance of three leagues and upward from the shore, and on the coast of Cape Breton at the distance of 15 leagues from the shore. The little islands of St. Pierre and Miquelon near the S. coast of Newfoundland were ceded to France to serve as shelter for the French fishermen. A few years later, in 1768, the number of French vessels at Newfoundland had increased to 259. By the treaty of peace in 1783 the right of the French to Miquelon and St. Pierre was confirmed, but their right to fish on the E. coast of Newfoundland between Cape Bonavista and Cap St. John was abandoned, and extended on the W. coast from Point Riche to Cape Bay. The French revolution was disastrous to the fisheries, and in 1792 fewer than 3,400 Frenchmen were engaged in the North American seas. During the reign of Napoleon they continued to languish, and the fishermen met with severe losses from the British cruisers. After the Treaty of the Pyrenees actually increased, and from 1885 to 1889 the cod fishery employed an average of 416 vessels, with an aggregate tonnage of 58,456; from 1842 to 1847, 889 vessels of 49,165 tons, of which 21,195 tons were employed on the coast of Newfoundland, 697 at St. Pierre and Miquelon, 6,816 on the Grand Bank, 18,703 on the same without drying, and 7,794 at Iceland. From 1841 to 1850 the number of men averaged 11,500; in 1852 the number of vessels was 450, and of men 14,000; in 1858, 493 vessels of 77,150 tons and 15,280 men; value of product, $5,500,000. In 1869, 676 vessels, manned by 14,149 men, produced about 670,000 quintals of cod and its products. In 1870, 188 vessels and 7,000 men were employed in the Newfoundland fishery, and 299 vessels, with 5,000 men, in the Iceland fishery. The protection and encouragement of this great branch of national industry has from its commencement been sedulously attended to by the French government. Bounties to a large amount are granted to the fishermen. At present (1874), under a law passed in 1851, the bounties to the cod fisheries are as follows: for each man of the crew of a vessel employed on the coast of Newfoundland or Iceland, 50 francs; for each metric quintal (200 lb.) of dry codfish, 20, 16, or 12 francs, according to the country to which it is shipped; the highest bounty being given on codfish shipped to the French colonies in America, India, and the W. coast of Africa. The bounty paid from 1841 to 1850 averaged $780,000 a year; in 1858 it amounted to $735,000, and in 1869 to $430,000. The French herring fishery is of great importance, and is carried on chiefly from Boulogne, Fécamp, Dieppe, Saint-Valery-en-Caux, Gravelines, Courseulles, and Berek. The following table exhibits the number of vessels engaged, with the tonnage and men, and the quantity of herring taken, during the most recent period of six years for which statistics are attainable:

Another valuable, French fishery is that of sardines, which is carried on both in the Mediterranean and on the coasts of Brittany. The total value of the French fisheries in 1866 was $10,965,707, viz.: cod, $2,725,929; sardines, $1,369,787; herring, $1,387,487; mackerel, $490,575; oysters, $287,585; shrimps and other crustaceans, $294,473; mussels, $263,709; sea shells, $191,002; the rest miscellaneous. In 1871 the whole number of vessels and boats engaged in the fisheries of all kinds was 18,407, having an aggregate tonnage of 142,774, and employing 110,440 men. The number of men engaged in the fisheries of women and children engaged in the coast fisheries. The value of the catch was 38,978,451; in 1870, $11,975,460.
The imports of products of the sea in 1868 were valued at $8,084,900, of which $7,605,000 were for consumption; in 1869, $8,617,000, of which $8,478,000 were for consumption. Of these amounts about half are cod and cod oil, the product of the national fisheries. The other principal items in 1869 were fresh-water fish to the value of $555,000; herring, $252,000; stockfish, $84,000; other fish, fresh, dry, salted, or smoked, $478,000; fish, pickled or preserved in oil, $180,000; lobsters, $169,000; oysters, $497,000; cod and mackerel roes, $943,000; whale and other fish oil, $510,000; whalebone, $290,000; crude coral, $428,000; fine pearls, $345,000. The exports in 1868 amounted to $4,675,000, of which $4,513,000 were the product of the domestic fisheries; in 1869, to $4,166,000, of which $3,892,000 were domestic. In the latter year the chief items were 54,415 quintals of salted cod, valued at $321,000; 28,922,949 lbs. of sardines, worth $2,058,000; and 1,108,677 lbs. of other fish, pickled or preserved in oil, valued at $805,000.

Spain participated in the fishery excitement following the discovery of America, and vessels from that nation visited Newfoundland as early as 1617. Sixty years later 100 vessels were employed in the fishery, but the number rapidly declined, and about the middle of the 17th century the connection of Spain with the American fisheries appears to have ceased. Portuguese vessels also early visited the fishing grounds, the number employed in 1677 being estimated at 50, but the distant fishery was soon abandoned. Spain was noted from the 8th to the 16th century for the boldness of her fishermen engaged in the deep-sea fisheries, which were pursued chiefly from the Basque provinces. The shore fisheries still continue, and flourish mainly on the coasts of the bay of Biscay. In 1886 the number of vessels and boats registered for the fishery was 12,127, with an aggregate tonnage of 42,026; number engaged, 10,549; men, 89,440; fish caught, 148,795,296 lbs.; value, $3,380,094; in 1887, registered, 12,596 vessels of 48,072 tons; engaged, 10,216; men, 37,658; fish caught, 105,609,767 lbs.; value, $2,573,341.—The English visited Iceland for cod before 1415, and the fisheries at that island were prosecuted as late as 1590 or 1690. Sebastian Cabot, returning from his voyage of discovery in 1498, first called their attention to the American fisheries. The first voyages in quest of fish, however, of which we have any account, were in 1517. In 1532, 40 or 50 houses for the accommodation of fishermen were built in Newfoundland, though no permanent settlement was effected till about a century later. In 1548 and 1558 acts were passed to encourage the fisheries, and at that time perhaps one of the most important branches of the industry is estimated that 206 English vessels annually visited Newfoundland, employing in catching and curing the fish not fewer than 10,000 men and boys. In 1602 Bartholomew Gosnold explored the coast of New England, and, catching cod near the southern cape of Massachusetts, gave it the name it bears. Capt. John Smith followed in 1614, and caught a considerable quantity of fish on the coast of Maine. From this time the fisheries on the coast of New England began to be prosecuted with vigor. In 1616 full fares were taken by eight English ships. In 1620 the island of Monhegan off the coast of Maine had become a noted fishing station. In 1622 profitable fishing voyages to New England were made by 85 English ships, and the number employed at Newfoundland was 400, which, however, in a few years decreased to 150 sail, partly from the diminished consumption of fish in Europe owing to the growth of Protestantism, and partly from the increase of the coast fisheries by the settlers on Newfoundland. Notwithstanding that measures were taken by the government to promote the fisheries, the number of fishing vessels continued to decline, till in 1670 only 90 were sent out. Several measures were accordingly adopted by the English government to prevent permanent settlement in Newfoundland, and consequent competition of boat fishermen from shore. These measures increased the number of fishing vessels, which in 1674 was 270, employing 10,800 men. Toward the end of the century settlers were again allowed to dwell in Newfoundland, but restrictions were imposed on the right to hold land. In 1701 the number of vessels employed was 131, with an aggregate tonnage of 7,991; number of boats, 993; fishermen, 2,797; curers (including women and children), 3,551; product, 216,320 quintals of fish and 3,798 hogsheads of oil. The boat fishery of the colonists again supplant the fishery in vessels of large size, and to encourage the home merchants parliament in 1775 allowed a bounty of £40 to each of the first 25 ships, £20 to the next 100, and £10 to the second 100, that should make fares of fish before the middle of July and return to the fishing grounds for a second landing. In 1774 the whole number of British subjects employed in the Newfoundland fisheries was 28,652, and the product amounted to 739,977 quintals. The English fisheries were exceedingly prosperous between 1796 and 1815. In 1814, 1,200,000 quintals of fish were produced, worth $12,000,000. After this period the fisheries soon fell entirely into the hands of the colonists, and the distant fishery from England ceased.—The home fisheries of the British islands are of great extent and importance, the herring fishery of Scotland holding the first place. Cod, hake, and ling are also extensively taken in Scotland. Along the English coast are found cod, herring, mackerel, turbot, lobsters, oysters, &c., which are taken in large quantities. The cod and herring fisheries are the most important. The pilchard fishery is carried on along the shores of Cornwall and Devonshire, employing during the season from 2,500 to 3,000 fishermen, and producing an average of 25,000 hogsheads of pilchards annually. In Ireland the fisheries
have fallen off since the famine, the people being too poor to procure the necessary boats and outfit. In 1846 the number of vessels and men engaged was 19,888, with 118,978 men; in 1856, 11,096, with 48,774 men; in 1866, 9,444, with 40,668 men; in 1868, 9,184, with 39,389 men; and in 1872, 7,914, with 31,811 men. In the last named year 1,118 of the vessels, with 5,485 men, were solely engaged in fishing; 665, with 3,126 men, principally; and 6,116, with 22,747 men, only partially. The number of those only partially engaged is probably too large by some 8,000, and they are for the most part employed only a few days in the year. The herring and mackerel fishery is perhaps the most important on the Irish coast, and is largely participated in by Cornish, Manx, and Scotch boats. The annual catch is valued at about £450,000. From Dublin to Waterford trawling is extensively carried on to supply the Dublin market. Herrings are caught here, and off Arklow and Wexford are the principal oyster banks. From Cork to Cape Clear the mackerel is chiefly taken, Kinsale being the head-quarters of that fishery, while from Ardglass to Dublin is the principal herring fishery. The value of the oysters annually taken is about £50,000. The salmon fisheries of the rivers of Great Britain and Ireland are very productive; they are regulated by law, and are in general private property. The estimated value of the catch of England and Wales has increased within a few years from £20,000 or £30,000 to £100,000; the Irish yield is about £400,000 a year, and that of the Scotch salmon fisheries about £300,000. In 1869 there were 5,113 persons employed in the salmon fishery of England and Wales; in 1870, 4,593; in 1871, 5,487; in 1872, 5,217, of whom 2,907 were net fishermen and 2,510 anglers. The number of vessels fitted out for the fishery of cod, &c., in Scotland in 1872 was 155, of 6,400 tons and 1,634 men; for the herring fishery, 95 vessels, of 2,976 tons and 454 men. The number of decked and undocked boats engaged in the shore-curing fisheries was 15,232, with an aggregate tonnage of 106,446, employing 48,175 fishermen and boys, 688 curers, and 41,980 (estimated) other persons. The value of boats was £281,538; of nets, £251,527; of lines, £24,823; total value of equipments, £297,929. In 1869 there were registered at the several ports of the United Kingdom 49,980 fishing boats, with an aggregate tonnage of 242,179, giving employment to 163,779 men and 13,569 boys. Of these numbers 16,195 boats, with a tonnage of 197,013, employing 54,757 men and boys, belonged to England and Wales; 17,996 boats, 87,001 tons, and 78,179 men and boys, to Scotland; 148,116 boats, 23,121 tons, and 28,819 men and boys, to Ireland. In 1873 the number registered was 40,548, with an aggregate tonnage of 261,781, viz.: England and Wales, 15,381 of 140,585 tons; Scotland, 16,785 of 92,595 tons; Ireland, 4,501 of 26,561 tons. Of the whole number, 5,284 of 145,887 tons were of the first class (15 tons and over), 25,462 of 102,992 tons of the second class (under 15 tons, not navigated by oars alone), and 9,810 of 14,003 tons of the third class (navigated by oars only). Besides the above, there were 875 boats of 5,047 tons registered at the Isle of Man, and 802 of 2,988 tons at the Channel islands. The following table exhibits the quantity of white herrings (salted in barrels) and of cod, ling, and hake cured in Great Britain at various periods, the returns after 1851 being confined to Scotland and the Isle of Man, and after 1868 to Scotland:

The chief seats of the herring fishery are Stornoway in the Hebrides, Peterhead and Fraserburgh in Aberdeenshire, and Wick. More than half of the cod, &c., are caught at the Shetland islands, and considerable quantities are taken at the Orkney islands and from Stornoway. The trade of the United Kingdom in fish and the produce thereof, from 1868 to 1872, is shown in the following tables:

The fish oil is brought chiefly from British America and the United States; fresh fish from Holland and Norway; and cured or salted fish from British America, Norway, France, the United States, and Denmark.

Included in the fourth column for 1871 are 7,752 cwt. of salmon, valued at £43,926; 28,871 of cod, &c., £63,490; 28,667 barrels
of oysters, £36,741; and 30,548 hogheads of pilchards, £36,819. Of the herrings, 451,015 barrels were sent to Germany, and 73,162 to Italy. The other fish is exported chiefly to France, Italy (which receives nearly all the pilchards), Belgium, Spain, and the Canaries. In 1871, 447,800 gallons of oil, valued at £257,514, the produce of foreign and colonial fisheries, were exported.—In Italy, in 1869, 29,325 men (including about 4,000 engaged in the coral fishery) were returned as employed in fishing; in 1870, 30,848; but these numbers are believed to be below the truth. In the former year 8,346 men were engaged in the sea fishery, and the rest in the coast fishery. In fishing proper there were 11,219 boats of 37,783 tons, of which 9,677 of 35,414 tons were employed along the coast, 670 of 5,556 tons at sea, and 792 of 6,763 tons in foreign waters; in 1867 the number of boats was 11,129, with an aggregate tonnage of 38,554. The foreign waters visited are chiefly those of the Austrian coast (Istria and Dalmatia); a smaller number of vessels frequent the coasts of Corsica and Provence in France, and the rest are employed in the Grecian seas and along the shores of Algeria, Tunis, and Egypt. The richest Italian fisheries are in the Adriatic, especially near Chioggia and Venice, while the sea near Liguria is the least productive. The principal kinds taken are sardines and anchovies, particularly in the Mediterranean, sword fish in the seas of Sicily, especially near Catania, and cuttle fish near the Adriatic coast of S. Italy. The tunny fishery, however, is the most important. It is carried on, chiefly in Sardinia and Sicily, by means of large fixed nets or weirs, called tonnare, of which there are 45. In Sicily the average catch is 15,000 tunnies, worth about £400,000; the average product of Sardinia is 25,000 tunnies, of a somewhat smaller size than those of Sicily, besides a considerable quantity sold in boxes, of which the exact value is not known. About 2,500 persons are employed in catching and preparing them for market. The artificial preserves of the Venetian territory, known as saldi da pesce, those at Comacchio and elsewhere in the province of Ferrara, and various salt lakes or marshes of Sardinia and the Neapolitan territory, where the fish are carefully fattened, yield an important product. There are 178 of these preserves on the Venetian coast, of which 68 are in the lagoon of Venice. They give employment to about 1,000 men, nearly all of whom belong to Chioggia, and produce annually nearly 6,000,000 lbs. of choice fish (eels, mullets, gold fish, &c.), worth about £326,000. Those of Comacchio produce an average of 2,650,000 lbs. annually, of which about 1,800,000, chiefly eels, are carefully prepared in that city, and exported to various parts of Italy, and to some extent to Germany and Austria, producing a revenue of about £150,000. The other important preserves of Ferrara are those of Mesola, which produce about 650,000 lbs. yearly, and those at the mouths of the Po. The principal Neapolitan lakes are Varano, which gives employment to 200 fishermen, and produces 5,500,000 lbs. of fish a year, and Lesina, Salso, and Salpi, which together employ 52 fishermen and produce 581,300 lbs.; others, whose exact product is unknown, employ 500 fishermen. The productive lakes and marshes of Sardinia are mostly in the S. and W. parts. The fish is consumed in the country, except a preparation of the roes of the mullet, which is sold to a considerable extent on the continent. Shell fish are cultivated in the gulf of Taranto, and oysters, mussels, &c., are shipped by rail to Naples and more distant points. At least 10,000 persons, including fishermen and workmen with their families, derive support from this source. The returns of the fisheries in the rivers and internal lakes of Italy are incomplete, but the principal ones employ 1,344 boats and 3,202 men, yielding about 2,500,000 lbs. of fish annually. The imports of fish for consumption in 1869 amounted to 564,000 cwt., valued at £3,500,000, of which 1,625 cwt. was the product of the national fishery, being a portion of the catch in foreign waters, the rest being sold directly to foreigners. Of the foreign imports 52,250 cwt. consisted of sardines, anchovies, &c. The exports were 38,900 cwt., valued at £279,500, of which 18,580 cwt. were the product of the national fishery and 21,320 cwt. of foreign fisheries. The foreign exports are chiefly from Austria, imported under a light duty and reexported to South America and other countries. The imports in 1870 were 622,000 cwt., valued at £4,245,000; exports, 31,100 cwt., valued at £256,000. In Austria in 1867 there were 1,082 boats engaged in fishing, having an aggregate tonnage of 3,001, and employing 3,643 men.—Tunis has an important tunny fishery at Sidi Daud, 10 m. W. of Cape Bon. The season commences in April and ends about the middle of July, during which time about 200 men are employed. The tunny is either boiled and packed in olive oil, when it is known as scamascico, or preserved in salt. The oil extracted from the heads, bones, and other refuse is much used by tanners and curriers. From 10,000 to 14,000 tunnies are taken in a good season. In 1871 the yield of scamascico was 8,200 barrels and about 200,000 lbs. in tin cans, of salted tunny 8,000 barrels, and of oil 65,480 gallons, the whole being worth about £150,000. The demand for this fish is limited to the countries bordering on the Mediterranean, the product of the Tunisian fishery being taken mostly to Italy and Malta. The tonnare of Ras Zibib and Ghaderse island are no longer in operation. Tunis also produces 5,000 or 6,000 cwt. of dried polys or octopods, a name under which certain species of cephalopods are known in the Levant and Greek markets, where they are imported for use in Lent, not being included by the eastern church in the prohibition against fish during seasons of religious ab-
The chief fishery is at the Kerkennah islands. Portugal competes with Tunis for the posses-
sion of the Kerkennah. The lakes and the city of Tunis, especially Bizerta, containing
various species, the most important of which are the gray mullet and the bream, supply the
home market with fresh fish. The roes of the mullet, prepared as buttarya, and exported prin-
cipally to Italy, are the chief source of revenue.

The Norwegian fisheries, extending along the
entire W. and N. coasts of that country, including the adjacent islands, are the most
productive in Europe. During the months of
January, February, and March, the cod and
herring visit in immense numbers the shores
which indent these shores. There is also a
summer fishery for herring, when the best
quality of fish is taken. The average annual
product of herring is 1,000,000 barrels. The
rivers abound in salmon, and large numbers of
lobsters are sent to the London market. The
exports of salmon and other fresh fish in 1871
amounted to about 76,000 cwt. of which
2,000 cwt. were salmon, and 70,000 cwt.
mackerel. In that year 24 vessels, with a
tonnage of 1,032 and 248 men, were fitted out
for the walrus or sea-horse fishery at Nova
Zembla and Spitzbergen, which brought in a
catch valued at about $27,000; the shark
fishery employed 28 vessels, with a tonnage of
895 and 178 men, and the product was of
about the same value. In 1860, 278 vessels,
2,682 boats, and 18,786 men were engaged in
the herring fishery, and 5,675 boats and 24,
266 men in the cod fishery. In 1868 the
exports of fishery products amounted to about
$8,000,000; in 1869, $9,600,000; in 1870,
$10,900,000, of which over $5,000,000 were
the value of cod-fishery products, and over
$4,500,000 of the herring fishery. The actual
value of the herringmen employed in 1868 was
$4,760,000; in 1869, $4,500,000; in 1870, $4,
900,000; in 1871, $5,500,000, of which $3,420,
000 represent the cod fishery, $1,840,000 the
herring fishery, and $370,000 the other fish-
eries. The chief markets are Spain, Prussia,
Sweden, Russia, and Holland, which receives
the greater part of the cod-liver oil. In Den-
mark, fishing is pursued to a considerable ex-
tent along the coast. The cod is the principal
fish, though flounders and herrings are also
taken, and in smaller quantities salmon, por-
poises, and oysters. In 1865, 387 vessels, with
a tonnage of 5,580 and about 4,000 men, were
employed. The principal fisheries, however,
are at the dependencies of Greenland, the
Faroé islands, and Iceland. Whale and seal
oil is the chief item at Greenland, and codfish
at the other points. Iceland in 1868 em-
ployed 2,700 of the fisheries in 143 vessels
and 8,481 open boats, with about 7,000 men; in
1870, 68 large decked boats and 8,092 open
boats, with from 2 to 12 ears each. The large
boats are employed generally in the shark fish-
ery, which is carried on mostly on the N. side
of the island; the smaller boats in the cod and
herring fishery, though the latter is little pur-
sued. Salmon are found in the rivers near
Reykjavik and at the north of the island, and
small quantities are exported. The exports of
fishery products in 1864 were 64,352 quintals
of fish and 8,963 barrels of roe and oil; in
1865, 29,807 quintals and 9,723 barrels; in
1866, 36,850 quintals and 8,722 barrels; in
1867, 83,619 quintals and 15,045 barrels; in
1868, 41,824 quintals and 9,338 barrels; in
1869, 56,856 quintals and 8,721 barrels. The
exports of an average year are 50,789 quintals
of salt fish, 2,136 of dried fish, 1,129 barrels of
salt roe, and 9,105 of liver oil (chiefly shark),
valued at $390,108. The total imports into
Denmark in 1870 were: salt herrings, 11,829,
126 lbs.; other fish, 3,427,128 lbs.; in 1871,
herrings, 19,104,788 lbs.; other fish, 5,494,110
lbs. The imports in 1870 were: fresh fish,
2,090,709 lbs.; herrings, &c., salted, 5,928,580
lbs.; in 1871, fresh fish, 2,188,165 lbs.; herring,
&c., 18,555,288 lbs. Among other European
nations, the Dutch for several centuries took
the lead in the fisheries, and the herring fishery
was long a chief source of their wealth.

It has, however, much declined. In 1867
Holland employed in the deep-sea fisheries
89 vessels, with an aggregate tonnage of 27,650;
number of men in vessels and boats, 11,880.
The value of the catch in 1866 was: herrings,
$665,666; cod, ling, whiting, &c., $2,328,290;
anchoires, $500,500; total, $3,356,086. The
exports in 1871 were 14,090 tons of salt herring
and 50,600 quintals of cod; exports, 67,
110 tons of salt herring, 84,241,000 smoked
herrings, 23,680 quintals of salt cod, 80,000
of dried cod, and 6,800,800 lbs. of fresh sea
fish. The number of fishing boats employed
in Belgium in 1871 was 266 of 8,963 tons, em-
ploying 1,028 men; the value of imports for
consumption was $1,472,600. The annual
value of the catch is about $500,000, of which
about $200,000 are the product of the cod fish-
ery. The principal maritime fisheries of Rus-
sia in Europe are: the Caspian sea, which
produces immense quantities of sturgeon, seals,
&c.; the Black sea and sea of Azov, yielding
the herring, tuna, salmon, sea trout, and an-
choires; and the Baltic, furnishing cod, halibut,
salmon, lampreys, &c. The White sea,
abounding in herring, cod, and halibut, fur-
nishes almost the sole support of the inhabi-
tants along its coast. The river fisheries are
important, the Volga being the most productive,
abounding in sturgeon, and supplying large
quantities of caviare. Lakes Lagoda, Onega,
and Ilmen, and White lake, contain valuable
fisheries. The product of all these sources has
been estimated at $11,500,000, of which
about one half is salt fish and about half fresh
fish. The coasts of Asiatic Russia swarm with fish,
but the fisheries are undeveloped. The waters
of China abound in fish, and it is estimated
that one tenth of the people of that empire de-
rive their food from the water. The coasts
FISHERIES

are crowded with enterprising and industrious fishermen, and besides the net and the hook, a great variety of expedients are resorted to. In the eastern provinces coromorants are trained to catch fish, which they bring to their master, who from his boat oversees 12 or 15 birds at the same time.—The great sea fisheries of the United States are mostly carried on from New England. They date from the earliest settlement of the country, it being probable that among the motives that led to the colonization of Massachusetts was the hope of profit from the fisheries on the coast, which Smith, Archer, Brereton, and other writers of the day represented as surpassing even those of Newfoundland. Very soon after their arrival at Plymouth the pilgrims engaged in the fisheries. In 1624 they sent to England a ship laden with fish, and in the next year two others with fish and furs. In 1628 they were selling fish to the Dutch at New Amsterdam. About 1670 the profits of the mackerel, bass, and herring fisheries at Cape Cod, which appear to have been considered public property, and to have been leased for the general benefit, were granted to find a free school, which was opened in 1671. From Boston fish began to be exported as early as 1633. In 1689 the general court of Massachusetts passed an act to encourage the fisheries, which exempted fishing vessels and all property connected with them from taxes and duties for seven years, and relieved fishermen during the fishing season and ship builders from military duty. At the close of the 17th century the merchants of Massachusetts exported annually about 100,000 quintals of codfish, worth $400,000, to Portugal, Spain, and Italy. In 1731 the fisheries of the colony employed 5,000 or 6,000 men. Ten years later the number of fishing vessels belonging to Massachusetts was 400, besides as many shallops and undecked boats. The annual produce of the cod fishery was about 280,000 quintals, of which $700,000 worth was exported. At the outbreak of the revolutionary contest the fishing towns were rich and populous. Marblehead was second only to Boston in population and property. In 1775, in the hope of starving New England into submission, the British parliament passed an act to deprive the colonies of the right of fishing on the banks of Newfoundland. The breaking out of hostilities which soon followed nearly destroyed the fisheries for a time, and the fishermen of New England turned their attention principally to privateering, though many enlisted in the army. In the negotiation of the treaty of peace in 1783, the right of the Americans to a share in the fisheries was secured by the firmness of John Adams, it being agreed "that the people of the United States shall continue to enjoy unmolested the right to take fish of every kind on the Grand bank, and on all the other banks of Newfoundland; also in the gulf of St. Lawrence, and at all other places in the sea where the inhabitants of both coun-
tries used at any time heretofore to fish; and also, that the inhabitants of the United States shall have liberty to take fish on such part of the coast of Newfoundland as British fishermen shall use, and also on the coasts, bays, and creeks of all other of his British majesty's dominions in America." The British government, however, to check the growth of the fisheries of the United States, and to encourage those of the colonies, by an order in council of July, 1783, prohibited the importation of American fish into the British West Indies, which had been one of the best markets for the New England trade. The federal government early recognized the importance of the fisheries, and from time to time granted bounties for their encouragement, and imposed protective duties upon the importation of foreign-caught fish. The first act was passed in 1789, which granted a bounty of 5 cents per quintal on dried and 5 cents per barrel on pickled fish exported, in lieu of a drawback of the duties on imported salt used in the cure, and imposed a duty of 50 cents per quintal on imported fish. In 1790 the bounties were doubled. By the act of Feb. 16, 1792, the bounty on dried fish was discontinued, and a specific allowance was made to vessels employed exclusively in the cod fishery at sea for four months between the last day of February and the last day of November: to vessels of between 30 and 50 tons, $1.50 per ton annually; and to those of more than 80 tons, $3.50 per ton; but the annual allowance to any vessel was limited to $170. Three eighths of the bounty was given to the owners, and the remaining five eighths was to be divided among the fishermen. To boats of between 5 and 30 tons, $1 per ton, to be divided among the fishermen, was allowed annually, provided they had brought in 12 quintals of cured fish per ton during the season. The act of May 2, 1792, fixed the allowance on pickled fish at 8 cents a barrel, and increased the bounties on vessels 20 per cent., after Jan. 1, 1793. In 1797 an act was passed, which increased the bounty on pickled fish to 12 cents a barrel, and further raised the allowances to vessels 33⅓ per cent., after Jan. 1, 1798. An act of 1799 increased the bounty on pickled fish to 30 cents a barrel. In 1807 all bounties were abolished. The act of 1818, similar in its provisions to those mentioned above, revived the bounty, and fixed the allowance to vessels of 5 to 20 tons at $1.50 per ton; to those of from 20 to 30 tons, at $2.40; to those of more than 30 tons, at $4; and on pickled fish, at 30 cents a barrel; but no vessel was to receive over $272. The law was modified in 1819, and allowances were granted to vessels of from 5 to 80 tons of $3 50 per ton; to those of more than 80 tons, $4 per ton; and if having a crew of 10 men, and employed 8½ months but less than 4 months, $3.50 per ton; no vessel to receive more than $360. In 1846 the bounty on pickled fish was discontinued, and a drawback of the duties on
imported salt used in the cure was substituted. The bounties to vessels were abolished by the act of July 28, 1866, but the duties on foreign salted United States shad were, in common with the 1817 act, repealed, except as to the master, in 1864. By an act of 1789, vessels of 20 tons and upward destined for the fishery were required to be enrolled, and they as well as registered vessels might be licensed for one year, which exempted them from the necessity of entering and clearing during that period. Vessels of from 5 to 30 tons were required to be licensed. The act of 1793 required vessels of 20 tons and upward to be enrolled and licensed, and those of less than 30 tons to be licensed. In 1828 an act was passed requiring a special license for vessels employed in the mackerel fishery; and in 1846 such vessels were given the privilege of engaging in the cod or other fishery, but they were not entitled to the bounty. During the war with England in 1812-15 the British cruisers kept the fishermen from the distant fishing grounds. Many of them entered the navy, and the frigate Constitution was chiefly manned by them, while great numbers engaged in privateering. In the negotiations for peace the British endeavored in vain to procure from the United States a relinquishment of their right to the fishing grounds, and maintained, after peace was concluded, that the state of hostilities had abrogated the concession of rights made in 1788. Discussions ensued between the two governments, which resulted in 1818 in a convention, by which it was agreed that the Americans should have the liberty of taking fish on the S. coast of Newfoundland between Cape Ray and the Ramean islands; from Cape Ray to the Quirpon islands; on the shores of the Magdalen islands; and also on the S. coast of Labrador from Mount Joly to and through the strait of Belle Isle, and thence northward indescribably along the coast. The United States on their part renounced formally the right of fishing on or within three marine miles of the British dominions in America not included in the above specified limits. In the summer of 1852 serious troubles broke out between the American fishermen and the British authorities, who claimed the right to exclude the former from the bays and inlets of the British possessions. The dispute was temporarily settled by mutual concessions, and in 1854 a reciprocity treaty was agreed upon by the two countries, containing the following stipulations concerning the fisheries, in addition to those contained in the convention of 1818: "The inhabitants of the United States are permitted with the consent of her Britannic majesty, the liberty to take fish of every kind except shell fish on the sea coasts and shores, and in the bays, harbors, and creeks of Canada, New Brunswick, Nova Scotia, Prince Edward island, and of the several islands thereto adjacent, without being restricted to any distance from the shore, with permission to land upon the coasts and shores of those colonies, and the islands thereof, and also upon the Magdalen Islands, for the purpose of drying their nets and curing their fish." It was specified that the liberty thus granted should apply solely to sea fisheries, and not to salmon, shad, or other river fisheries; and that the fishermen should not interfere with the rights of private property, or trespass on parts of the shore occupied by British fishermen. Similar rights, with similar reservations, were granted to British fishermen on the E. coast of the United States N. of lat. 45°. This treaty was terminated March 17, 1886, by virtue of notice given by the United States, March 17, 1855, pursuant to one of its provisions. In 1870 difficulties again arose between the United States and Great Britain respecting the fisheries, in consequence of certain unfriendly acts of the provincial authorities, and in 1871 the stipulations of the treaty of 1854 given above were revived by the treaty of Washington, which also provided that "fish oil and fish of all kinds, except fish of the inland lakes and of the rivers falling into them, and except fish preserved in oil, being the produce of the fisheries of the United States, or of the Dominion of Canada, or of Prince Edward island, shall be admitted into each country, respectively, free of duty." The rights of British subjects on the coast of the United States were, however, restricted to that portion N. of the 89th parallel. The necessary laws having been passed by the several countries, these provisions went into operation July 1, 1878, to remain in force for the period of ten years thereafter, and further until the expiration of two years after the United States or Great Britain shall have given notice to terminate them. It was provided that, with the consent of the United States and Great Britain, these stipulations might extend to Newfoundland, and a colonial act was passed March 38, 1874, to carry them into effect.—Mackerel were early caught by the New England colonists, and the fishery soon assumed considerable importance. They were probably at first taken in seines, nets, and boats from the shore, but before the revolution fleets of sloops were engaged in the fishery, and in 1770 not fewer than 100 vessels were employed in Massachusetts. The use of vessels appears subsequently to have declined, and to have been revived about the beginning of the present century. Mackerel are caught on the coast of New England and as far S. as the entrance of Chesapeake bay, but the most productive fisheries are in the bay of Chaleur and the gulf of St. Lawrence. In the Bay of Fundy 500 vessels were employed annually in the cod fishery an average of 665 vessels, having an aggregate tonnage of 35,630, and manned by 4,405 men, and exported 178,800 quintals of fish to Europe and 172,500 quintals to the West Indies. From 1786
to 1790 the number of vessels was 599 of 19,135 tons, employing 8,375 men, and the exports were 106,600 quints to Europe and 149,050 quints to the West Indies. Herring are taken to some extent in the rivers and bays from North Carolina northward, though the erection of mills and dams has driven them from many localities which they formerly frequented. American vessels, chiefly from Gloucester, Mass., the great fishing port of the country, visit New Brunswick, Newfoundland, the Magdalen islands, and Labrador for that fish, while the halibut fishery is pursued to some extent from that port on George's and the western banks and at Greenland. Extensive menhaden fisheries have sprung up within the last 15 years on Long Island, and at other points along the coast from New Jersey to Maine. The oil obtained from this fish is much used by leather dressers, and the scrap or refuse is a valuable ingredient in the manufacture of fertilizers for the exhausted cotton lands of the south. It is estimated that in 1873 2,000,000 gallons of oil, valued at $900,000, and 40,000 tons of scrap, worth $640,000, were produced. Oysters are found particularly in Chesapeake and Delaware bays, from which they are brought in large quantities and planted in the vicinity of New York city, where they acquire a peculiar flavor. Turtles are abundant in the waters surrounding the Florida keys, and the catch is of considerable value. Besides the sea fisheries, the river and lake fisheries of the United States are of great importance. There are valuable shad fisheries in the Connecticut, Hudson, Delaware, Potomac, and other rivers falling into the Atlantic. The great lake fisheries are those of Erie, Huron, Michigan, and Superior. The whitefish is the principal object of pursuit, although trout, pickerel, and lake herring are caught in large quantities. The waters of the Pacific, N. of California, abound in valuable fish, the fisheries of Alaska being of vast extent and great productiveness. Cod is the chief object of pursuit, but halibut and herring are also numerous. In 1864, 1 vessel was fitted out from San Francisco for the northern cod fishery; in 1865, 7; in 1866, 18; in 1867, 28; in 1868, 19; in 1869, 27; in 1870, 33. They frequent mainly the banks in the vicinity of Kadiak and the Shumagin and Fox islands, though the Okhotsk sea is occasionally visited. From 1864, when the business commenced, to 1870, 276,414 quints of fish, valued at $2,457,414, were caught; the product of 1870 was 94,750 quints, worth $754,840. The fishery is pursued during the summer. Several species of salmon, including the king salmon (Oncorhynchus orientalis), which frequently weighs from 80 to 90 lbs., swam in the Yukon and other Alaskan rivers. The salmon fisheries of the Columbia river are of great value. In 1873 the number of fish preserved was 382,000, weighing 5,800,000 lbs., and worth $559,000, of which 2,700,000 lbs. were canned, and 2,600,000 lbs. pickled. The following table exhibits the tonnage employed in the fisheries in the United States at various periods since 1790, the cod and mackerel fisheries prior to 1831 and since 1867 not being separated:

From 1850 to 1862 the number of vessels ranged from 2,414 to 8,315 (in the latter year); in 1866 the number was 2,220; in 1869, 1,714; in 1870, 2,992; in 1871, 2,429; in 1872, 2,888. In the last mentioned year 1,490 vessels of 574,402 tons were above 20 tons each, and 866 with a tonnage of 10,144 under 20 tons each; 666 vessels, with an aggregate tonnage of 18,790, belonged to Maine; 45, of 3,419 tons, to New Hampshire; 1,301, of 68,283 tons, to Massachusetts; 76, of 888 tons, to Rhode Island; 169, of 4,922 tons, to Connecticut; and 128, of 1,815 tons, to New York. In 1873 the number of vessels was 2,456, and the tonnage was distributed as follows: Massachusetts, 54, 188; Maine, 46, 196; Connecticut, 4, 199; New York, 1,771; California, 1,177; Rhode Island, 1,071; New Hampshire, 922. There were 187 vessels of 44,755 tons engaged in the whale fishery. Of the number of fishing boats employed from the shore there are no accurate statistics. The number of seamen employed in the cod and mackerel fisheries in 1869 was 21,768; in 1869, 28,043; in 1864, 21,926; in 1868, 28,250. The tables of occupations in the census of 1870 include 27,106 fishermen and oystermen, but the returns are admitted to be imperfect, large numbers of persons engaged wholly or partially in fishing being returned as sailors, agriculturists, &c. The value in round numbers of the products of the national fisheries of all kinds, as returned in the censuses, was $12,000,000 in 1840, and $10,000,000 in 1850. The tables of fisheries in 1890 include 429 establishments in the whale fishery, having a capital of $13,292,000; value of materials used, $2,789,060; number of hands employed, 12,301; wages paid, $3,509,080; value of product, $7,749,305; oyster fishery, 427 establishments, $498,233 capital, $442,235 materials, $2,273,916 wages, and $1,410,497
product; other fisheries, 1,121 establishments, $4,129,447 capital, $1,060,910 materials, 15,811 hands, $3,191,841 wages, and $5,134,608 product; total, 1,970 establishments, $17,919,759 capital, $4,309,555 materials, 30,388 hands, $5,077,577 wages, and $13,384,405 product. The value of products in 1866 was $12,500,000.

The fishery table in 1870, which does not include the whale fishery, returns 2,140 establishments, employing 20,504 hands; capital, $7,469,575; wages paid, $3,449,381; value of materials used, $1,624,276; of products, $11,696,522. The chief producing states were: Massachusetts, $6,215,256; Maine, $276,610; Connecticut, $702,790; Michigan, $567,576; Ohio, $388,121; New Jersey, $374,915; Washington territory, $289,746; North Carolina, $255,839; New York, $255,750; Wisconsin, $314,190; California, $150,260; Rhode Island, $124,506; Florida, $101,528. The principal items were 559,982 quin-tals of cod, 2,451 tons of halibut, 31,210 barrels of herring, 221,003 of mackerel, 69,561 barrels and 26,700 thousand whitefish, 674,819 bushels of oyster, 823,940 shad, 24,118 barrels of salmon, and 1,810,000 lbs. of canned salmon. The following table shows the value of the products of the national fisheries since 1858, brought in by vessels making entry at the custom house, but does not include the product of the shore fisheries, nor fish brought in by coasters and fishing smacks, except so far as unofficial information has been obtained, which in recent years has been much fuller than formerly, through the efforts of the bureau of statistics to obtain a complete statement:

The principal items in 1872, not including the whale fishery, were 783,487 quin-tals of cod, valued at $3,194,288; 490,408 of mack erel, $2,436,009; 159,923 of herring, $340,963; 178,859 of other cured fish, $557,615; 730,700 bushels of oysters, $238,080; 45,077,278 lbs. of fresh fish (other than shell fish), $1,106,500; 1,437,434 gallons of oil, $508,402; 10,757 skins, $117,411; value of shell fish (other than oysters), $591,924; of other fishery products, $316,057. The quantity of salt withdrawn from warehouse for curing fish in 1871, under the act of 1868, was 1,697,139 lbs., valued at $66,077,220; 1872, 57,830,092 lbs., worth $60,655. The table below includes the quantities of dried or smoked and of pickled fish exported, with the quantities of mackerel inspected, at various periods since 1870:

* Sperm whale, and other fish oil.
† Other products of the fisheries.
‡ In Massachusetts.

In 1871 the total value of exports of the products of the national fisheries was $2,612,890; of foreign fisheries, $376,018; in 1872, domestic exports, $3,913,897, including oysters to the value of $234,723, and whale and other fish oil to the value of $1,250,074; foreign exports, $544,690. The principal points of shipment are Great Britain, Hayti and Santo Domingo, France, Cuba, Porto Rico, the French and Dutch possessions in America, and the British West Indies. The imports of foreign fish and products thereof in 1871 amounted to $3,091,518; in 1873 to $3,157,183, including $3,836,079 lbs. of fresh fish for daily consumption, imported free of duty, valued at $278,921; 238,612 gallons of whale and other fish oil, $106,249; 68,693 barrels of herring, $385,926; 90,689 of mackerel, $610,457; and sardines and anchovies to the value of $1,172,704. With the exception of the sardines, which were brought from France and Great Britain, and some herrings imported from Germany, the imports were almost exclusively from British America.

—the British American colonies are the seat of fisheries among the richest in the world, which have been pursued since the first settlement of those countries. Their early history is referred to above. In 1883 Nova Scotia employed 570 vessels and shallopys and 640 boats, and exported 160,640 quin-tals of dried, 37,154 barrels of pickled, and 5,041 boxes of smoked fish, valued at $500,000; 772 vessels, 3,400 boats, and 10,000 men. In 1851 the number of vessels was 813; of boats, 5,161; nets and seiners, 30,154; men, 10,894; exports, 196,484 quin-tals of dried, 268,842 barrels of
FISHERIES

picked, and 15,409 boxes of smoked fish, valued at $41,586. These figures are exclusive of Canso and other district fishing, of which in 1847 was valued at $302,616. In 1869 the number of vessels was 655, with an aggregate tonnage of 21,656, besides 819 sail boats, 8,793 skiffs, &c., and 3,558 whale boats. The exports of New Brunswick in 1829 were valued at $137,930; in 1839, $300,405; in 1848, $126,130. The value of the fisheries of Nova Scotia in 1860 was $2,062,000; New Brunswick, $398,385; Canada, $700,000; total, $3,650,365. The products of the Dominions of Canada in 1869 amounted to $4,584,151 66; in 1870, to $7,677,911 72. For the year ending June 30, 1871, the products were valued at $7,673,300, viz.: Ontario, $1,193,524; Quebec, $1,193,612; New Brunswick, $1,185,083; Nova Scotia, $5,101,081; (Cape Breton, $1,288,060). The number of fishermen was 38,029, viz.: Ontario, 1,953; Quebec, 5,093; New Brunswick, 5,161; Nova Scotia, 31,181; (Cape Breton, 8,780). Quebec also returned 88 vessels, 2,651 fishing boats, 1,864 flatboats, 359 sailors, and 2,558 shoremen, as employed in the fisheries. The principal items of the catch were 670,497 cwt. of cod, 144,572 of scale fish (haddock, hake, and pollack), 13,600 of halibut, 240,805 barrels of mackerel, 335,700 of herring, 35,235 of alewives, 15,693 of shad, 60,050 of mixed fish, 15,317 of whitefish, 7,477 of trout, 7,513 of salmon, 2,017,484 lbs. of fresh salmon, 1,015,531 salmon in cans, 614,292 gallons of oil (mostly cod), 1,180,000 cans of lobsters, and 38,450 bushels of oysters. The value of the fisheries for the year ending June 30, 1872, was $9,570,116, viz.: Ontario, $267,883; Quebec, $1,820,189; New Brunswick, $1,985,459; Nova Scotia, $8,018,929. The principal items for Ontar&o were 17,940 barrels of whitefish, 7,656 of trout, and 8,974 of herring; Quebec, 217, 741 cwt. of cod, 29,047 barrels of herrings, and 138,529 gallons of cod oil; New Brunswick, 626 barrels and 1,474,777 lbs. of salmon, 2,049 barrels and 38,680 cans of mackerel, 89,996 barrels and 872,148 boxes (smoked) of herrings, 22,996 barrels of alewives, 6,949 of cod tongues and sounds, 3,071 of shad, 7,944 of eels, 24,620 of oysters, 81,421 quinlats of cod, 19,361 of pollack, 27,442 of hake, 1,190 of haddock, 1,055,485 cans of lobsters, and 51,715 gallons of oil; Nova Scotia, 8,599 barrels and 629,595 lbs. of salmon, 116,681 barrels and 50,500 cans of mackerel, 185,518 barrels and 84,309 boxes (smoked) of herrings, 11,712 barrels of alewives, 4,648 of halibut, 8,867 of shad, 525,249 quinlats of cod, 24,099 of pollack, 89,214 of hake, 2,422,058 cans of lobsters, and 414,419 gallons of oil. The rivers of British Columbia swarm with salmon, and the waters of which in coast abound in cod, herring, halibut, &c.; but the fishery is undeveloped. Whitefish, trout, &c., are found extensively in Manitoba and the N. W. territory, particularly in the waters that empty into Hudson Bay. The imports of fish and the products thereof into the Dominion for

the year ending June 30, 1872, amounted to $1,086,866, of which $41,819 were brought into Ontario, $3,908 into Quebec, $207,543 into New Brunswick, $612,348 into Nova Scotia, and $10,088 into British Columbia. Of the whole amount, $919,840 worth came from Newfoundland and Prince Edward island. The exports amounted to $4,328,883, viz.: $59,858 from Ontario, $755,890 from Quebec, $271,059 from New Brunswick, $3,200,821 from Nova Scotia, and $37,708 from British Columbia. The principal points to which the exports were taken are the West Indies, the United States, South America, Great Britain, Italy, and Portugal. The value of fish caught in Prince Edward island in 1860 was $272,592; in 1869, $169,580, of which $110,670 were mackerel, $19,017 herring, and $59,083 cod and scale fish. The product of the Newfoundland fisheries in 1860 has been stated at $4,440,000. The principal items of export since 1895 have been as follows:

In 1873 there were also exported 5,049 tiers of salmon, 2,189 barrels of trout, 1,619 of other fish, 441 cwt. of halibut and haddock, 124 packages of tongues and sounds, 9,587 gallons of whale oil, 14,616 of oiler oil, and 26,306 of blubber. Of the cod in the above table, 303,404 quinlats were exported from Labrador, and of the herring 58,760 barrels. The total value of the exports from Newfoundland in 1869 was a little less than $21,300,000; the chief markets are Spain, Portugal, Brazil, Great Britain, and the British West Indies. The population of the colony in 1869 was 146,586, of whom nine tenths are directly or indirectly engaged in the fisheries. The number of fishermen in 1873 was 82,000. The total annual value of the fisheries on the banks and off the coasts of the British North American provinces was estimated in 1869 by the United States consul at Halifax at nearly $33,000,000, viz.: provincial fisheries, nearly $13,000,000; United States, $7,000,000; French, $4,000,000. The most comprehensive account of the fisheries of the world and of their commercial value is contained in a report of Col. Richard D. Cutts of Washington to the secretary of state on "The Commerce in the Products of the Sea," made in 1889, and printed by order of the senate as executive document No. 54 of the 35th session of the 49th congress. The statistics are for 1885. We extract several important statements from this report. The following table exhibits for 15 countries the gold value of the principal products of the sea, with the chief producing countries in the order of value:

</table>

Total: $73,658,264 to $73,190,158. 

If to this total the product of Turkey, Brazil, Australia, China, &c., were added, the sum would be increased to $30,000,000 as the annual value of those products of the sea fisheries which are the subject of statistical record. The products of the seas, rivers, and lakes of the United Kingdom, consumed without record in England, have been estimated at more than $8,000,000 annually; the river herring, shad, whitefish, oysters, &c., sold in the coast and lake fish markets of the United States are valued at over $7,000,000; and the interior fisheries of Russia in Europe at $6,000,000. Similar estimators for other countries would produce an aggregate of $30,000,000, making a total of $32,000,000 as the annual value of the fisheries, marine and inland, of the world. The returns of 10 of the countries included in the above table embrace 80,883 vessels and boats, with an aggregate tonnage of 551,466, and 309,682 men; and it is estimated that 450,000 men are directly engaged in the fisheries of the whole 22. The annual value of the commerce in products of the sea fisheries as shown by the returns of 48 countries and dependencies is over $41,000,000. The following table exhibits the imports, exports, and balance of trade in fishery products of the principal nations:

</table>

FISHERIES, the lowest class of vertebrated animals, red-blooded, breathing through the medium of water by means of branchial or gills. Like other vertebrates, they have an internal skeleton, the brain and spinal cord protected.
by a bony cavity and canal, muscles external to the bones, never more than four extremities, and the organs of sensation in the cavities of the head. Living in a medium heavier than air, and very nearly of the same density as their bodies, locomotion is comparatively easy, and their form, fins, and smooth surface are admirably calculated for rapid propagation; breathing by means of air contained in the water, their blood is cold, and consequently their vital energy is less than that of mammals and birds. The brain is very small, and the organs of sense calculated to receive only the simplest impressions of sight, smell, hearing, taste, and touch; generally unable to make any sounds, with an inflexible body, simply articulated limbs, fixed and staring eyes, living in comparative darkness and silence, there is no change in their countenance, no expression of feeling or emotion, no apparent motives in their monotonous existence beyond the necessity of supplying themselves with food, escaping from their enemies, and providing for the continuance of their species. Their chief pleasure is that of eating, and their only danger is from the superior strength and quickness of other inhabitants of the waters or from the artifices of man; to eat, and to avoid being eaten, are the great occupations of their lives, and the varieties of their forms, their instincts, and their favorite haunts are intimately connected with these objects; the movable filaments of the lophius or angler, the prolonged snout of the pipe fish and chetodon, the winglike expansions of the flying fish, and the electric armature of the torpedo and gymnotus, are all instruments either for offence, defence, or escape. Cold-blooded, they are little sensitive to changes of temperature, and their migrations and seasons of propagation are less influenced by thermometric conditions than are those of the higher vertebrates; many fishes spawn in winter, and it is in the cold northern waters that the innumerable individuals of the cod and herring species are pursued by man. Even the loves of fishes are marked by the same sang-froid; very few species have sexual union; in most, the males pursue the eggs rather than the females, and coldly fecundate the spawn of unknown adults, from which arise young which they will never recognize and probably never see. A few females, as the sticklebacks, deposit eggs in nests made by the males; some carry their eggs and even their young with them for a short period, and feed and protect their little ones like true mothers; but, as a general rule, the joys of maternity are unknown among fishes, and the sexes care nothing for each other even in the breeding season. With all this apparent lack of enjoyment, and low position in the vertebrated series, the class of fishes displays as much, and perhaps more variety and elegance of form and beauty of coloration than the more psychologically favored birds and mammals; there is not a color of the rainbow, nor a metallic reflection, nor the hue of a precious stone, which may not be seen in the bands, spots, and scales of fishes. Many tribes of men, both savage and civilized, obtain their principal nourishment from the sea; the countless numbers of cod, mackerel, herring, and other migrating fishes, give employment to thousands of men, and prove important items of national wealth. The habits of fishes, even of the most common species, are comparatively little known from the difficulty of observing them in their native haunts; we know that some are solitary, and others gregarious; some great wanderers, others restricted within narrow limits; some surface swimmers, others remaining at the bottom, or at great depth; some living on sandy bottoms, others in rocky, others in muddy localities; some found only in salt water, others only in fresh, others in both or in brackish waters; some seen only near the shore, others in very deep water far from land; some sluggish like the skates, others active like the sharks and scomberoids; some perish quickly out of the water, as those with widely open gills like the herring; others live a long time after being caught, like the eel, or can travel over land, or climb trees, like the climbing perch (anabas osundens).—The external form of fishes is very various, but the head is not separated from the body by a distinct neck, and the trunk generally is continued gradually into the tail; in the skates the tail is long and distinct from the body. The body may be rounded as in the diodon, cylindrical as in the eel, compressed horizontally as in the rays, or flattened vertically as in most fishes; the head may be larger than the body as in the angler, compressed, angular, and obtusely as in the bullhead, prolonged into a beak as in the pipe fish, or the upper jaw may project over the mouth as in the sword fish and sharks; the mouth may open on the under or upper surface, or, as is usual, at the end of the snout, with a greater or less extent of gape. The nostrils may be single as in the sharks and rays, or double as in most fishes. The eyes vary greatly in size and in direction; generally on the sides of the head, in the uranoscopus they look upward, and in the flounder family both are on one side. In the cartilaginous fishes the external borders of the gills are attached to the skin, and the gill openings correspond in number to the intervals between the branchiae; but in the osseous fishes there is a single large gill opening on each side, just behind the head, serving for the exit of the water, after it has been swallowed and made to pass over the gills, the flapping of the gill covers assisting the respiratory process. Some of the apodal or muraenoid fishes have hardly the rudiments of fins; in others, the fins are either vertical and on the median line, or lateral and in pairs. The lateral fins are the pectoral and the ventral, corresponding to the anterior and posterior limbs of higher animals; the pectorals are attached behind the opening of the gills; the ventrals are generally on the lower surface of the body, and may be variously placed from under the throat,
even in advance of the pectorals, to the origin of the tail. The vertical fins serve the purposes of keel and rudder, and are the dorsal on the back, the anal under the tail, and the caudal at the end of the body. All these fins vary in size and in the number of rays which sustain them, being sometimes spiny, sometimes soft, branched, and composed of many small joints. In the old system of nomenclature, the malacocterygians are bony fishes with soft articulated fin rays; the acanthoptygians, bony fishes in which some of the rays are spiny; and the chondropterygians, the so-called cartilaginous fishes. These classes have been variously subdivided, and the reader is referred to the article Ichthyology for the numerous classifications from Artedi to Agassiz. The anus may open far behind the ventrals, move forward with them, and in their absence be situated even under the throat, as in sternacanthus; the jaws may be armed with different kinds of teeth, which often exist also on the tongue and various parts of the mouth and throat; the lips may be provided with sensitive barbels as in the horn pout, or with fleshy appendages as in the sea raven (hemipterus). The skin may be nearly naked or covered with very small scales; the scales may be rough grains as in the sharks, thick plates as in the sturgeon, a smooth enamelled coat of mail as in the lepidosteu, smooth as in the herring, or serrated as in the perch. Along the side of the body is the lateral line, formed by a series of pores, the outlets of the muciparous glands; this line extends from the head to the caudal fin, generally at the mid height of the body, nearer the back in some fishes than in others, sometimes ceasing long before the region of the tail, and occasionally multiple; the scales along this line are arched, notched, or perforated for the protection of the ducta; they are sometimes larger or smaller than the rest, and may be the only ones present; they often have strange forms and armatures. In various parts of the body, but especially about the head, are numerous pores, or water tubes, by which water is introduced into the system, even into the circulation; some are situated along the lateral line. The tissue of the fish skeleton is either cartilage, fibro-cartilage, or bone; the first is found in the sharks and rays, the second in the sunfish (orthorhynchus) and angler (lepisosteus), and the last in common fishes; the chemical composition is that of other vertebrates, principally the phosphate and carbonate of lime. The osteology of the head, branchial apparatus, trunk, and limbs has been already given as fully as the limits of this work will allow, in the article Comparative Anatomy (vol. v., p. 178); for further details see Cuvier and Valenciennes, vol. i., and articles on "Fishes." Most fishes are able in their movements; the belon, for instance, can swim at the rate of 40 ft. in a second, and can with ease pass over 20 to 25 m. in an hour; progress is effected by lateral strokes of the water by the alternate flexions of the tail and trunk; the manner in which the vertebrae are connected allows easy motion of the spine from side to side, and the muscles destined to move it are so largely developed as to form the principal bulk of the body; while the vertical fins increase the amount of sail-like surface for purposes of locomotion, the pectorals and ventrals keep the fish in an upright position, and assist in directing its course; the movements of the gill covers, by forcing backward the water which is passing between them, contribute to propel the fish forward. In the pipe fish (syngnathus) the dorsal fin in its vibration resembles that of the screw of a steam propeller, and, with a similar action of the tail, causes a forward or backward motion without any apparent movement of the body; the nice adjustment of the movements of the fins of the pickerel, so that while every ray seems in action the fish is perfectly stationary, must have been noticed by every angler. The movements of fishes in a vertical direction are greatly assisted by the swimming or air bladder, which, though anatomically a rudimentary lung, by the air which it secretes enables those that have it to rise or fall in the water by compression or extension exercised by the ribs; it is placed in the abdomen under the spine, and communicates often with the esophagus or stomach; the air is a product of secretion, and its containing reservoir is sometimes a shut sac; it is often wanting in some species of a genus when others possess it, and is generally very small or absent in ground fishes, such as skates and turbots; in some cases it is considerably vascular, resembling very much a pulmonary sac. The muscles of fishes are generally pale and comparatively soft, divided into parallel layers by aponeurotic laminae; the flavor and odor are very different from those of flesh, and the gases of decomposition are much more fetid. Some fishes have a singular apparatus by which they adhere to other bodies, animate or inanimate; in the remora, of the genus athena, there is a flattened disk on the top of the head, composed of movable cartilaginous plates, by which it fixes itself to stones or the bodies of other fishes; in the lump fish and other dieoboli, the ventrals are arranged as to act as suckers for attaching them to various substances; the lamprey eel (petromyzon) also attaches itself by the mouth to stones and fishes. Referring the reader to Comparative Anatomy for details on the nervous system, the organs of sense, the scales, and the digestive apparatus, only general points of interest need be mentioned here. The cavity of the skull is very small compared to the size of the body, and the brain is far from filling it, a considerable space being occupied by a spongy fatty substance; the lobes are placed one behind the other in the following order from before backward: olfactory or lobes of smell, the optic or lobes of vision, and the cerebellum. From the scar covering of their skin, the sense of touch must be obtuse, and the lips are their
only prehensile and principal tactile organs, with the exception of the barbels and other appendages above alluded to. The concomis, slightly movable, and often four-fifths, the branched gill, receives but few nerves, and cannot be the seat of any sense worthy of the name of taste; and moreover, the food does not remain long enough in the mouth for any exercise of this sense. The olfactory apparatus is more complicated, but it is traversed neither by air nor the water used in respiration; the nasal cavities do not communicate with the mouth. The ear, almost always entirely within the cranium, on the sides of the brain, consists essentially of a vestibule and three semicircular canals, which receive the vibrations of the integuments and cranial walls; there is rarely anything that can be called external ear, drum, or tympanic cavity; loud, sudden, and strange sounds frighten fishes, as the experience of every fisherman tells him; in ancient, and even in modern times, they have been taught to come and receive food at the tinkle of a bell, or the pronunciation of pet names. The eyes have neither true lids nor lacrimal apparatus; the pupil is large and permanently open, the lens is spherical, and the flat cornea is covered by the skin. Fishes are very voracious, most of them living on animal food, and swallowing indiscriminately anything of this kind which comes in their way; some genera, like the lamprey eels, live upon the juices of other fish, and the mouth is provided with circular cartilages, fleshy disks, teeth, and a piston-like tongue, which enable them to adhere to any surface. The intestinal canal is short and simple, and digestion is rapidly performed, and their increase in size is remarkably affected by the nature and abundance of their food; their limits as to size and the natural duration of life are very little known in the great majority of species.—The blood of fishes is red, and the globules are elliptical and of considerable size. The heart is placed under the throat in a cavity separated from the abdomen by a kind of diaphragm, protected by the pharyngeal bones above, the branchial arches on the sides, and generally by the scapular arch behind; it consists of a venous sinus, auricle, ventricle, and bulb; all these cavities circulate venous blood, and therefore physiologically correspond to the right side of the mammalian heart, though Owen says that the heart of fishes with the muscular branchial artery is the true homologue of the left auricle, ventricle, and aorta of higher vertebrates, tracing the complication of the organ synthetically; the auricle and ventricle, however, are alone proper to the heart itself, the sinus being the termination of the venous system, and the bulb an addition to the pulmonary artery; two other compartments, therefore, are not like the four divisions of the human heart, but succeed each other in a linear series. The circulation is double, that of the system at large and that of the branches being complete and distinct, and there is also an ab-
a few enjoy sexual congress, and are ovoviviparous and viviparous, but the young are almost always born, with the sexes as born. This is owing to the simultaneous development of great numbers of eggs deposited in the same locality, and to the instinct possessed by some species to keep in company, that fish occur in what are called banks and schools; these schools, composed of individuals kept together only by similarity of food and habits, and in which each one looks out for himself without regard to the wants of the rest, make long migrations from the sea to the rivers and back again, and from one favorite locality to another. At the time of laying the eggs, the migrating species generally approach the shores, and ascend rivers, often coming thousands of miles; year after year, at the same season, the fish appear in immense numbers. The migrations of the herrings, salmon, shad, smelt, mackerel, &c., afford well known instances of these phenomena. All fishes are of distinct sex. The testes vary much in form in the oseous fishes, and are remarkable for their enormous development in the breeding season, when they are called mild or soft roe. The ovaries in most oseous fishes are two elongated sacs, closed anteriorly, and produced posteriorly into short, straight, and wide oviducts, which coalesce before reaching the cloaca; the greatly developed ova are called the roe. There are several interesting points in connection with the development of fishes which will be better introduced here than in special articles. In most fishes it has been already stated that the exclusion of the ova or roe precedes fecundation, and that in a few (the sharks and rays especially) the ova are fecundated before exclusion; when the embryonic membranes contract no adhesion to the uterine walls, the fish is called ovoviviparous, and in such the embryo escapes from the egg before it quite quits the parent, while in the ovipara the ovum is expelled while the embryo is contained in it; when adhesion takes place by vascular interlacements, the species is said to be viviparous; the great difference between viviparous fishes and mammals is, that in the former the rupture of the membranes takes place long before birth, while in the latter this occurs at the moment of exclusion. The sudden and great increase of the mild and roe is not compatible with a firm bony cavity such as would be formed by ribs and sternum; this explains the physiological reason for their free or floating ribs. At the approach of the breeding season the colors become brilliant, as is familiarly seen in the bright red throat of the male stickleback; the female seeks to deposit her eggs in shallow water, where the heat and light of the sun may bring them to maturity and the male follows close to diffuse the fecundating milk over them. It is well known that some fishes deposit their eggs in species of nests, as the stickleback, bream (peto), and lamprey; Aristotle mentions a fish of the Mediterranean, a species of gobius, as making a nest of seaweeds and depositing the spawn in it, the male keeping guard over the female and her young; the bassas, silurid fishes of Desmarest (catlecheus), make nests of grass and leaves, and both sexes guard the eggs and young; the toad fish (batrachus) has been observed on the south shore of Long Island lying concealed in deep holes protecting its young, which attach themselves to stones by means of the yolk sac. Another kind of incubation is found in the pipe fish (syngnathus), in which the ova are transferred from the female to a kind of marsupial pouch under the tail of the male, being fecundated during this process, and the cavity closing over them; when the young are hatched they follow the male, and return into the pouch at the approach of danger; the male hippocampus or sea horse has a similar subabdominal marsupial pouch. In some species of bagre, a siluroid fish from the rivers of Surinam, the females carry their eggs in the mouth, showing the young in various stages of development even to the fish recently hatched; eggs of two distinct species have been found in the mouth of a single individual. In the aspredos, or trompetta, the eggs are attached by pedicels surmounted by cups to the under side of the abdomen as far forward as the mouth, on the sides of the pectoral and ventral fins, and as far as the middle of the tail; after the eggs are hatched the pedicels are absorbed. Viviparous fishes may be divided into two groups: the first includes those in which the gestation is almost wholly ovarian, as in embiotoca, anableps, blennius, &c.; the second those in which the egg enters the oviduct before the development of the embryo begins, as in the plagiostomes. Prof. J. Wymann ("Proceedings of the Boston Society of Natural History," vols. v. and vi.) has described the development of anableps Gronetti (see Anab- ales), in which he found the ovarian egg free in a distinct closed sac, as the mammalian ovum is in the Graafian vesicle; when the fœtuses escape into the oviduct the gestation is carried on nearly to its completion in the ovisac, which becomes vascular, and by its apposition with the papillose of the yolk sac carries on the functions of respiration and nutrition. In the embiotocidae of California the mode of development is similar; in E. lineata Girard found young three inches long and one inch deep; in another genus of the group (holconotus) he detected as many as 16 young about an inch long, which had evidently recently escaped from the egg shell; the ovarian gestation here is somewhat different from that in anableps, as the young ova are seen between the dividing membranes of the ovary while the fœtuses are in course of development in the general cavity of the organ; it is not determined whether their ova leave the ovisac before or after impregnation. Many species of gadidae, as the cod, haddock, whiting, and American hake, have been found to have a viviparous reproduction, the embryos being developed within the ovary.
thus confirming the supposition of many intelligent fisherman. Internal impregnation is very general in the placostomes, and as this is more certain than the indeterminate spawning of common fishes, the eggs are much fewer in number and of larger size, as in birds; the egg in its passage through the oviput receives a dense corneous covering, so that the cases resemble oblong flattened pillows, often with long tendrils at the corners, in which the embryo is snugly coiled up; they become attached to objects floating, near the surface, and are there developed by the influence of solar light and heat; from the researches of Prof. Wyman it appears that in the skates the eggs are fecundated in the ovary, and that the egg case is formed in advance to receive it as it descends. From these and other structural peculiarities Agassiz has separated the chimeras, sharks, and rays from fishes proper, and elevated them into a class, the selachians. Many facts go to show that fishes undergo a kind of metamorphosis as well as insects. August Müller has proved that the two genera hitherto considered characteristic of the cyclostome fishes are really different stages of the same animal; he has raised ammocetes from the egg of petromyzon, and watched the change of the former into the latter genus.—The usual mode of impregnation in osseous fishes, so analogous to the manner in which the fertilizing pollen is brought in contact with the stigmata of flowers, naturally suggested the idea of artificial impregnation; and this has been successfully practised both by naturalists for the study of embryology, and by fish breeders as a profitable branch of industry. (See Fish Culture.)—In most fishes the young when hatched are left to shift for themselves, and of course the greater number are devoured by larger fish, aquatic birds, and reptiles; many species devour each other; small mackerel are often found in the stomachs of larger individuals, when they are abundant; so that with all their fecundity the class of fishes does not multiply beyond the limits set by nature. Though fishes are cold-blooded, and the watery element is less affected by sudden changes of temperature than the air, there are external circumstances which limit their distribution both in depth and extent of surface. The difference in density and chemical constitution of salt and fresh water draws the line between the marine and the fluviatile faune; below a certain depth, probably not far from 120 fathoms, the absence of light and the increase of pressure would prove an insurmountable barrier to most of the class. Fishes are able to resist extreme cold, and to regain vitality after having been apparently frozen, but the average of cold has an important influence on their geographical distribution; the average temperature of the water for the year has been usually taken as the regulator of this distribution, but Dana has shown that the line of temperature established by the average of the 80 coldest days in the year gives the close to the limits of the marine faune. A few arctic species are the same in America and Europe, migrating southward from the same northern centre; but below this region the marine fauna of America is essentially tropical, and that of Europe essentially temperate. In the Atlantic the zones of temperature are remarkably modified by the Arctic, Gulf stream, and African currents; on the American side the temperate zone extends only from Cape Cod to Cape Hatteras, about 10 degrees of latitude, while on the eastern it extends from the Swedish coast to the Cape Verd islands, nearly five times as many degrees; while the tropical zone, which in America extends from Cape Hatteras to 25° S., or 60 degrees, on the other side embraces only about 20 degrees on the Guinea coast of Africa. As a few instances of local distribution, in contradistinction to the cosmopolitan scionomboids and cyprinoids, may be mentioned the American cotioid and goniolidae, the Mediterranean sparoids, the tropical scinomidae, aquamoisominae, and mullets; the pleuronectida of the temperate regions; the tropical fresh-water characini of America and Africa; the true salmons of arctic and cold regions; and the marine labroids, and fresh-water chromids. Estimating the number of vertebrates at 20,000, the number of living species of fish may be set down at 10,000, of which more than 6,000 are described. Of all the vertebrates, fishes are by far the most numerous and widely distributed in the earth's strata; their remains are found from the Silurian to the tertiary formations, and are of great aid in determining the changes of the surface of our planet during successive and long geological periods. The first great geological division, the primary age, comprises the lower and upper Silurian and the Devonian; till the close of this age there were no air-breathing animaels, and in the Devonian period fishes were the lords of creation; the latter has, therefore, been very properly called the "age of fishes." Agassiz, in his Recherches sur les poissons fossiles (1833-'43), laid the foundation of fossil ichthyology; 1,000 species are described in the most complete and scientific manner, with superb illustrations. He divides fossil fishes, as he afterward did the recent ones, into four orders, according to the form and structure of their scales; these orders, ganoids, placoids, ctenoids, and cycloids, have been sufficiently described in the article Comparative Anatomy (vol. v., p. 173). Three fourths of all known fossil fishes belong to the ctenoids and cycloids, which occur in all formations from the chalk upward; the remaining fourth belong chiefly to the ganoids (with enamelled scales like the garpike and sturgeon) and the placoids (like sharks and rays), and extend through all the fossiliferous strata, but are most common in the coal, Jurassic, chalk, and tertiary formations; no fish with ctenoid scales (like the perch) or cycloid (like the cod) is found below the chalk. The forms of the earlier fishes were many of them very strange; the pectorals were
very small and always in advance of the ventrals; above the chalk, the ventrals begin to approach nearer the head; they were not so fully developed as our fishes, but seem to have been, like the sturgeon, arrested in their development. During this epoch the sea covered the greater part of the surface of the globe, and all animals whose remains have been preserved were without exception aquatic, breathing by gills; the climate must have been uniform and warm; the dry land had hardly appeared above the waters, and all creation was as silent as in mid ocean.—For the systematic classification of fishes, and the history of the science, see Ichthyology.

**FISH HAWK** a bird of prey, of the family falconiidae, subfamily aquilinae, and genus pandion (Savigny). This genus, which belongs to the same subfamily with the eagles, is characterized by a short bill, curved from the base to the acute hooked tip, compressed laterally with slightly festooned margins; wings extending to tip of tail, the second and third quills equal and longest; tail moderate and rather even; general form heavier and less adapted for rapid and vigorous flight than that of the eagles; tarsi short and strong, covered with small circular scales; toes very rough beneath, long, and united at the base; claws long, curved, and sharp. Gray describes only three species: *P. Carolinensis* (Gmel.) in America, *P. haliaetus* (Linn.) in the old world, and *P. leucocephalus* (Gould) in Australia. These species are nearly allied to each other, and inhabit the temperate regions, in the vicinity of lakes, rivers, and shallow arms of the sea; they have been seen several hundred miles from land, probably driven off the coast by severe storms.—The female American fish hawk; or osprey, is 25 in. long, with an extent of wings of about 5 ft.; the male is somewhat smaller. In the adult the head and under parts are white; a stripe through the eye, the top of the head and upper part, wings, and tail, deep umber brown, the latter having about eight bands of blackish brown; numerous spots of pale yellowish brown on the breast; bill and claws bluish black; tarsi and toes greenish yellow; the tibial feathers short, and the tarsus feathered one third the way down in front; the young have the upper parts edged with white. This well known species inhabits the continent from the Atlantic to the Pacific; its powerful and protracted flight, and the dexterity which it displays in catching fish, render it conspicuous among our birds of prey. It is one of the most sociable of the hawks, migrating in considerable numbers along the coast in spring and autumn; it is mild, even timorous in its disposition, rarely quarrelling with its mates, and even nesting on the same tree with birds which other members of its family would chase or destroy; the readiness with which it yields its prey to the eagle has been alluded to under that head. It never pursues its prey in the air; flying at a moderate height above the water, when it sees a fish within its reach it closes its wings, and plunges headlong, sometimes entirely disappearing below the surface; if successful, it retire to its nest or to a tree to eat it at leisure; it is said sometimes to strike a fish too heavy for its strength to raise, and, unable to free itself, to be drawn under water and drowned. Though a heavy flier compared to the eagle, its flight is high and its motions graceful; in the rare instances in which it alights on the ground, it walks in a very awkward manner. The fish hawk appears in the middle states from the south about the beginning of April, and is welcomed by the fishermen as the forerunner of various kinds of fish; it goes southward again as winter approaches. The males arrive eight or ten days before the females; during the love season both sexes assist in making new nests and in repairing old ones, and in incubation; the nest is placed in the fork of a high tree near the water, and composed of sticks, grass, and seaweed, firmly united, three or four feet wide and as many deep. As evidence of its gentle disposition, Audubon says that he has seen the fish crow and purple gakake raising their families in nests built among the outer sticks of the fish hawk's nest. The eggs are three or four in number, broadly oval, yellowish white, with numerous large irregular spots of reddish brown; the young are carefully fed and protected, and often remain in the nest until they are as large as the parents; only one brood is raised in a season. When wounded, they defend themselves with bill and claws; they are capable of flying off with a fish weighing 5 lbs.—The fish hawk of Europe resembles very much the American bird.

**FISHKILL** a town and village of Dutchess Co., New York, on the Hudson river and the Hudson River railroad, opposite Newburgh, 55 m. N. of New York; pop. of the town in 1870, 11,752; of the village, 787. The village is
sustained on Fishkill creek, a small affluent of the Hudson, about 5m. N. E. of its mouth, and containing a weekly newspaper, and a national and a savings bank. The town also contains the villages of Fishkill Landing, Glenham, Matteawan, Carthage Landing, Hughsonville, and a part of Wappinger's Falls. Fishkill Landing is situated on the Hudson, near the mouth of Fishkill creek, and is connected by ferry with Newburgh; pop. 2,992. It contains an iron foundery and machine shop, several factories, a national bank, two newspapers, and three churches. Glenham, Matteawan, and Wappinger's Falls are also important manufacturing places. The Dutchess and Columbia division of the New York, Boston, and Montreal railroad extends through the town from E. to W., and connects with the New York and Harlem and the Connecticut Western railroads at Millerton.

Fisk, Wilber, an American clergyman and educator, born at Brattleboro, Vt., Aug. 81, 1792, died at Middletown, Conn., Feb. 22, 1888. He was educated at the grammar school in Poacham, Vt., at the university of Vermont, and at Brown university, where he graduated in 1815. He then began the study of law, but in 1818 entered the itinerant ministry of the Methodist Episcopal church. In 1823 he was preaching elder of the Vermont district. The following year he left the itinerant work to devote himself to the cause of Christian education. At the date of his entering the ministry there was not a single literary institution of importance under the auspices of the Methodist church in America. In connection with others he founded the academy of Wilbraham, Mass., of which he became principal in 1826. In 1828 he was elected bishop of the Canada conference. The following year he was chosen at nearly the same time president of La Grange college, Alabama, and a professor in the university of Alabama. The Wesleyan university, Middletown, Conn., was founded in 1880, and Dr. Fisk, having declined all other appointments, was elected its first president. In the general conference of 1832 he was foremost in advocating the establishment of the Oregon mission. On account of impaired health, he made the tour of Europe in 1835-6. During his absence he was elected bishop of the Methodist Episcopal church, but declined the office, to continue that work in which he had become the representative man of his church. His chief works are: "Sermons and Lectures on Universalism," "Reply to Pierpont on the Atonement," "The Calvinistic Controversy," and "Travels in Europe." His life has been written by the Rev. Joseph Holdich (1842).

FISTULA (Lat., a pipe), an ulcer in the form of a narrow canal, more or less deep and sinuous, lined by a pale false mucous membrane, indolent and indisposed to heal, kept up by some local pathological condition of the soft parts or bones, or by the presence of some foreign irritating body, and leading or not to a suppurating cavity. There may be a single external or internal opening, or there may be a communication between the skin and the mucous, serous, or synovial cavity. Some writers restrict the term fistula to such of the above lesions as take their origin from some natural cavity or excretory duct, while those communicating with abscesses and caused by foreign bodies or disease of the bones are called fistulous ulcers or sinuses; but the distinction is of little importance, as the pathological conditions and the principles of treatment are the same. Fistulas arise when abscesses are not thoroughly healed from the bottom, when any irritating substance (as a ligature or a piece of dead bone) remains in the tissues, or after wounds of excretory ducts. If superficial and of recent origin, fistulas may heal of themselves; but if deep-seated or chronic, they generally require surgical interference. They are usually rather tedious and annoying than dangerous; but when large, deep, with several openings and profuse discharge, they may produce hectic fever and fatal exhaustion. The principles of treatment are: to remove any irritating cause, as a piece of dead bone or foreign body; to prevent the accumulation of matter, by counter openings, if necessary, and by properly directed compression; and to excite adhesive inflammation by pressure, stimulating injections and applications, setons, cauties, and, as a last resort, incision of the fistula, that the soft parts may have an opportunity of healing from the very bottom of the wound; the constitution should also be strengthened by nourishing diet and tonic medicines. The most common varieties are the anal, lachrymal, salivary, and urinary fistulae. Anal fistula is situated by the side of the sphincter ani muscle, and is difficult to heal. Fistulas on account of the constant muscular contractions and the passage of fecal matter into it. There may be an opening into the bowel internally and externally, either or both; according to Brodie, this affection always begins by an ulceration on the side of the rectum into which the fecal matter escapes, causing abscess and consequent fistula; but in some cases there is no opening into the bowel, the sinus reaching only to its outer coat: this affection is frequently a painful complication of consumption. The simple and efficient remedy for this fistula is division of the walls from the internal opening to the skin, so as to prevent muscular contractions; after this operation the introduction of lint allows the wound to heal by granulation from the bottom. This affection is considerably more common in males than in females. Lachrymal fistula is situated at the inner corner of the eye, and communicates with the lacrymal sac; it begins by an obstruction of the nasall duct, followed by inflammation, abscess, and fistulous opening. Besides the usual remedies for acute and chronic inflammation, the obstructed duct may be restored by the introduction of a metallic or elastic style. In a similar manner the
duct of Steno may be obstructed, so that the saliva dribbles out on the cheek instead of passing into the mouth; the remedy is to establish the passage from the fistula to the mouth by puncture and the introduction of silk or flexible wire, and then paring and uniting the edges of the external opening.—In urinary fistula there is an opening from the perineum into the urethra, through which the urine dribbles wholly or in part; it is generally caused by urinary abscess and extravasation into the soft parts. For its relief all strictures should be dilated, the urethra brought to a healthy condition, and the fistula stimulated to contract and granulate by external applications. Sometimes there is a communication between the urethra and the rectum. But the most disgusting and difficult to remedy are the vesico-vaginal and recto-vaginal fistulas, in the former of which the bladder, and in the latter the rectum communicates with the vagina; both of these affections are the consequences of the laceration and sloughing after tedious labor; the most successful method of treatment is by paring the edges of the fistula and uniting them by sutures.—A fistula may communicate with any of the abdominal viscera, or with any part of the body, on the surface or deep-seated, that is diseased from abscess, dead bone, or the presence of a foreign substance.

FITCH, Am. See supplement.

FITCH, Ebenezer, an American clergyman, the first president of Williams college, born in Norwich, Conn., Sept. 26, 1758, died in West Bloomfield, N. Y., March 21, 1888. He graduated at Yale college in 1777, where in 1780 he was appointed tutor, and continued to act as such for several years. In 1790 he was chosen preceptor of the academy in Williamstown, Mass., and when in 1798 it grew into and was incorporated as Williams college, he was elected its first president, which office he filled till 1815, when, resigning, he was chosen pastor of the Presbyterian church in West Bloomfield, N. Y. This charge he held till 1827, and after his resignation continued to preach occasionally almost till his death.

FITCH, John, an American inventor, and the pioneer in steam navigation, born in Windsor, Conn., Jan. 21, 1743, died in Bardstown, Ky., in June or July, 1798. He worked on his father’s farm till the age of 17, when he was employed for some time on coasting vessels, and then became apprentice to a clock maker. On reaching manhood he commenced business as a brass founder in a small way, failed in an attempt to manufacture potash, married unhappily, separated from his wife, and settled in New Jersey as a button maker and silversmith. When the revolutionary war broke out, he was elected a lieutenant in the New Jersey line; but on meeting with some real or supposed injustice he left the service, and was employed by New Jersey as armorer of the troops. Driven away by the invading army, he engaged in his trade of silversmith in Bucks co., Pa., till the approach of the enemy again made it necessary for him to shift his quarters. He next supplied the American troops at Valley Forge with tobacco, beer, and other articles, in which he drove a prosperous business, resulting in a considerable accumulation of depreciated continental money. With this he purchased Virginia land warrants and removed to Kentucky, where he was appointed deputy surveyor. Being captured by the Indians, he was marched through the wilderness to the British post at Detroit, where he was detained some time as a prisoner. He was at length exchanged, and finding his way again to Bucks co., formed a company for the survey and purchase of lands in Kentucky and Ohio. On his return from these surveys, by which he acquired several hundred acres of land, he petitioned congress for an appointment as surveyor, and while awaiting the unsuccessful result of his application prepared a map of the N. W. country, which he engraved on a sheet of copper and printed on a press of his own manufacture. In April, 1785, the idea occurred to him of propelling a carriage along an ordinary road by the force of steam. After a week’s study he abandoned it as impracticable, and devoted himself to the application of steam to the propulsion of vessels. He immediately sought to interest leading men in Pennsylvania in the project; in August following he addressed a petition to congress in regard to it, and in September presented a drawing of the boat, models, and tube boiler to the American philosophical society. He next petitioned the legislature of Virginia for aid. James Madison presented his memorial, and Patrick Henry, then governor, took an interest in the plan. But the legislature was slow, and Fitch conceived the plan of raising the necessary funds by the sale of his map. He accordingly executed a bond to Gov. Henry in the sum of £250, conditioned that if he should sell 1,000 copies of his map at 5s. each, he would in nine months deliver the exhibit, a steamboat in the waters of Virginia. Nothing came of it. The assembly of Pennsylvania was next applied to, and encouraged him to the extent of a favorable report of a committee. The assembly of Maryland did the same; but there were no funds in her exchequer. The legislature of New Jersey rejected a proposition to grant £1,000, but gave Fitch an exclusive privilege for 14 years for the use of boats propelled by fire or steam. Disappointed in these efforts, Fitch formed a private company, and in April, 1786, the working model of a steam engine with a one-inch cylinder was the humble commencement of his enterprise. In three months’ time he moved a skiff on the Delaware by his new contrivance at a speed satisfactory to the associates. In March, 1787, a bill vesting in John Fitch exclusive right to pass the legislature of Pennsylvania, and similar laws were enacted in Delaware and in New York. In August of that year a new steamboat was tried on the Delaware, with an engine of 12-inch cylinder. Though the boat did not
attain sufficient speed to answer the purpose of a packet, the trial proved conclusively the efficiency of steam as a motive power for vessels. To increase this efficiency it was only necessary to enlarge the machinery. Soon after this success the company learned for the first time that James Rumsey of Virginia claimed to be the first inventor of the steamboat, and to have made a prior successful trial. A war of pamphlets followed. An examination of the evidence leaves no reason to doubt that the first practical success in steam navigation was made by Fitch. It is probable enough that Rumsey had entertained the idea of propelling a boat by steam before it occurred to Fitch, as it had previously occurred to others. In 1788 Fitch built a second boat for the old machinery, which made several passages between Philadelphia and Burlington at the rate of four miles an hour. More power was requisite for commercial success. A boat built for an engine of 18-inch cylinder was ready for trial in August, 1789. After several failures, and changes in the machinery, this boat was successfully tried in the spring of 1790, and was run as a passenger boat on the Delaware, making during the season more than 2,000 miles at an average speed of 7½ miles an hour. But more money was wanted to introduce the invention, and the numerous stockholders in the enterprise could not be brought to respond to further assessments. Time ran on, and Fitch was cramped for the necessities of life. He repeatedly asserted that the passenger traffic of the great western rivers would one day be carried on exclusively by steam; that ships of war and packet ships would navigate the Atlantic by steam; and that some one to come after him would reap fame and fortune from his invention. He now sought some small offices under the government of Pennsylvania and that of the United States, but was disappointed. Failing to interest new parties in his project, and the company absolutely declining to make further advances, Fitch abandoned his boat, and for some months wandered about the streets of Philadelphia, a ruined man, with the reputation of a crazy projector. On Oct. 4, 1792, he presented a sealed envelope containing manuscripts to the library company of Philadelphia, with a request that it might be kept unopened till 1823. In 1798 he went to France in pursuance of a contract with Aaron Vail, contemplating the introduction of his invention in Europe; but the times were not propitious, and the means and patience of Fitch were exhausted. On his return he remained a while in London, and in 1794 he worked his passage to the United States as a common sailor, landed at Boston, and spent nearly two years at East Windsor. In the summer of 1796 he went to New York, and placed a small boat on the Collect pond, worked by a submerged wheel at the stern, which has been described as a screw propeller. Soon after he visited Oliver Evans in Philadelphia, and expressed his intention of forming a company to introduce steamboats on the western waters. With this view, and to ascertain the condition of his western property, he went to Kentucky, where he found his land overrun with squatters, and no encouragement for his steam projects. Mortified by his inability to carry out his great project, and weary of the lawsuits in which he had been engaged for the recovery of his lands, Fitch became despondent and desperate, and terminated his life by swallowing a dozen opium pills which had been left with him from time to time by his physician to use as anodynes. The sealed envelope was formally opened by the directors of the library company in 1823, and was found to contain a detailed history of his adventures in the steamboat enterprise, inscribed "To my children and to future generations," with a journal and other papers, from which his biography was prepared by Thompson Westcott (Philadelphia, 1857). A memoir of Fitch by Mr. C. Whittlesey is in SPARKS'S "American Biography."
FITZGERALD, L. Edward, lord, an Irish soldier and politician, fifth son of the first duke of Leinster, born near Dublin, Oct. 16, 1768, died June 4, 1798. He was in part educated in France, entered the British army, and distinguished himself as aide-de-camp to Lord Rawdon in the latter part of the American revolutionary war, and was severely wounded in the battle of Eutaw Springs. After sitting for some time in the Irish house of commons, and travelling on the continent, he rejoined his regiment in Canada. He returned to Ireland in 1790, and was again elected to the Irish parliament. In 1792 he visited Paris, where he became associated with some of the leading revolutionists. At a banquet given by Englishmen in Paris, he publicly renounced his nobility, and proposed a toast to the success of the republican arms, and was consequently dismissed from the British army. He then returned to Dublin, joined the society of United Irishmen, of which he was made president in 1796, encouraged other political and military organizations, defending them in the Irish parliament, and negotiated with the French directory, till a warrant was issued by government for his apprehension. He refused to abandon his associates, but secretly directed the revolutionists from a place of concealment in Dublin after the other principal leaders had been arrested, and was at length discovered and captured after a desperate struggle. He was severely wounded, and died in prison. His biography was written by Thomas Moore (2 vols. 8vo, London, 1881). II. Pamela, lady, wife of the preceding, reputed daughter of Mme. de Genlis and Philippe duke of Orleans (Égalité), died in Paris in November, 1881. She was educated with the children of the duke, as an English orphan. She was married to Lord Fitzgerald at Tournay in 1790, and after his death to Mr. Fitzcairn, American consul at Hamburg. A separation ensued, and she resumed the name of Fitzgerald, and lived at Montauban till 1880, when Louis Philippe, the associate of her childhood, being called to the throne, she went to Paris. The king refused to receive her, and she died poor.

FITZGERALD, Percy H. See supplement.

FITZGERALD, 1. Sir Anthony, an English lawyer and jurist, born in Norbury, Derbyshire, died in 1538. After a distinguished career at the bar, he was appointed in 1528 a justice of the court of common pleas, and held that office until his death. He was the author of a work in old French, which is of great authority in the law, entitled Le grand abrégement collecté par le juge très réverend, monsieur Anthony Fitz-Herbert (printed by Pynson in 1514, by Wynkin de Worde in 1516, and again in 1577). Among his other works on legal subjects was "The Office and Authority of Justices of the Peace" (1588, often reprinted; last ed., 1617), and "The New Natura Brevisium" (1584; last ed., 1794, with a commentary attributed to Chief Justice Hale, and notes and references). His "New Treatise for all Husbandmen" (4to, London, 1628) passed through more than 20 editions. II. Thomas, a learned English Jesuit, grandson of the preceding, born at Swinerton, Staffordshire, in 1552, died in Rome in 1646. After various fruitless attempts to influence the Roman Catholic powers of Europe to aid the Roman Catholics of England, he entered the society of the Jesuits, and for the last 22 years of his life presided over the English college at Rome. He wrote a number of treatises of a religious and controversial character.

FITZHERBERT, Maria, wife of George IV. of England, born in July, 1766, died in Brighton, March 29, 1827. Her father, Waller Smythe of Brambridge, Hampshire, was of an old Catholic family, and she was married successively to Edward Weld of Dorset and Thomas Fitzherbert of Stafford, being left a widow a second time in 1781. In 1785 the prince of Wales, afterward George IV., first saw her, and in December of that year they were privately married by a clergyman of the established church, in the presence of witnesses. The union, being contrary to the English statute, which prohibits marriage between a subject and a prince of the blood royal, was not valid in law. Subsequently the prince contracted a legal marriage with the princess Caroline of Brunswick; but after his quarrel with Queen Caroline he returned to Mrs. Fitzherbert. His excesses, however, compelled her to leave him, and she retired to Brighton, where she passed the remainder of her life, receiving a large pension from the government.

FITZROY, Robert, a British admiral, born at Ampton Hall, Suffolk, July 5, 1806, died April 30, 1865. He entered the navy in 1819, and obtained his first commission Sept. 7, 1824. After serving on the Mediterranean and South American stations, he was appointed in 1828 to the command of one of the vessels which had been sent by the government, under Capt. King, upon an expedition to explore and survey the coasts of Patagonia, Chili, and Peru. In 1881 the Beagle, under his command, was fitted out for another surveying expedition. Charles Darwin accompanied this expedition as naturalist, and after its return in 1836 published a journal of the researches made upon it into the geology and natural history of the countries visited. In 1841 Capt. Fitzroy represented the city of Durham in parliament, and in the following year was appointed acting conservator of the river Mersey. In 1843 he became governor and commander-in-chief of the colony of New Zealand, which offices he held for three years. In 1854 he was placed at the head of the meteorological department of the board of trade, in 1857 was appointed rear admiral, and in 1868 vice admiral. In 1862 he established a system of storm warnings. He committed
suicide in a fit of mental aberration, brought on by overtaking his brain in the performance of his duties. He was the author of several works, the most important of which was the second volume of the "Narrative of the Surveying Voyages of H. M. S. Adventure and Beagle, between the years 1828 and 1836" (London, 1839), the first volume being by Capt. King, and the third by Darwin.

FITZWILLIAM, William Westworth Fitzwilliam, fourth earl of that name in the peerage of Ireland, and second in that of England, an English statesman, born May 30, 1748, died Feb. 8, 1838. He opposed the ministry of Lord North in the American war of independence, but did not take office when his uncle, the marquis of Rockingham, formed a new cabinet in 1782. Although a political friend of Fox, he abandoned him upon hearing his ulories of French revolutionary principles, and took office as president of the council, July 11, 1794, when the duke of Portland became the nominal head of the cabinet. In 1795 he was lord lieutenant of Ireland, in the height of the disturbances which then agitated that country; but was recalled after a few months, against the decided wishes, it is said, of the Irish people, for having supported a bill presented by Grattan in favor of Catholic emancipation. He was president of the council for a short time in 1806, on the death of Mr. Pitt, but his liberal views kept him out of office during the greater part of his career.

FIUME (Illyrian, Riječ; Lat. Vitopolis, afterward Fanum Sancti Viti ad Flumen; Germ. St. Veit am Flaim), a royal Hungarian city and free port, situated in a valley on the gulf of Quarnero, at the mouth of the Fiumara, 88 m. S. E. of Trieste; pop. in 1899, 18,809, of whom 14,089 belong to the city proper. The old part of the town, on the slope of the hill, is poor-looking and gloomy; the new part, which stretches along the coast, is well built, cheerful, and neatly paved. It has a provincial and district court, a chamber of commerce and industry, two gymnasias, a naval academy, and many remarkable buildings, including churches, the government house, the city hall, a market hall with colonnades, a nunnery, a hospital, and the casino, which contains concert and ball rooms, and a theatre. In the vicinity is an ancient castle. The harbor admits only small vessels, larger ones anchoring in the gulf at a distance of 8 m. The products consist chiefly of linen, woollens, leather, carthenware, sugar, wax, beer, and rosoglio; the exports, mostly the produce of Hungary, are wheat, wine, tobacco, hemp, timber, rags, &c. There are extensive sugar refineries, mills, tanneries, and paper manufactories; but the principal industry is ship building, from 20 to 30 sailing vessels being annually built. It is connected with the interior by two railways. Fiume became a free port in 1723, and is now one of the most important seaports of the Austro-Hungarian empire. In 1868 the entrances were 2,789 vessels of 185,484 tons.—Vitopolis is mentioned as a flourishing town of Liburnia under the Roman emperors. Subsequently the town several times changed its rulers, until in 1471 it was incorporated with the dominions of the house of Hapsburg. Maria Theresa in 1776 united it with Hungary as a corpus separatum. From 1809 to 1814 it was occupied by the French. In 1814 it fell again to Austria, and in 1822 it was once more united with Hungary. In consequence of the revolution of 1848—a it was united with the crownland of Croatia, but in 1870 it was made an independent district, with a royal governor of its own, directly under the central government of Hungary.

FIXTURE, a word of frequent use, and in regard to which some little confusion exists, because the exact legal definition is precisely opposed to the meaning commonly given to the word. A fixture, in law, is a personal chattel in some way annexed to the realty, but such, or so annexed, that he who put it there may take it away. We apprehend that the common meaning of the word is, a thing so fixed to the realty that it cannot be taken away. That is, an ornament, or utensil, or addition of any kind, is commonly called a fixture, if so affixed to the land (or to the house) that the owner of the land necessarily owns the thing, and it cannot be removed without his permission. Kent uses the word in both senses, but rather inclines to the common meaning; and for convenience, through this article, we shall mean by fixtures things so fastened to the land (or to a house which is fastened to the land) that they cannot be removed against the will of the owner of the land.—The first remark to be made is, that the whole modern law, which permits a great number of things to be attached to the land and thence removed by the occupier without reference to the will of the owner of the land, is in derogation of the common law. That originally regarded land as almost everything, and personal as of little value; and it was a nearly invariable rule that anything which was once attached or annexed to the land, or made a component part of anything so annexed, became at once the property of the owner of the land. This is certainly not the law now in England or the United States. Whether a thing was a fixture or not, was formerly made to depend almost entirely upon the intention with which it was put up or annexed; and this was gathered from slight indications. Thus, the same thing was a fixture if nailed on that remained personal property if screwed on, because the use of screws, which can be unscrewed, indicated the intention of removing it. Intention still remains a very important test; but another has come to be of almost equal value, viz., the capability of removal without injury to the premises, or the possibility of taking the thing away and restoring the premises to the same order and condition in which they were before it was annexed.—The earliest relaxations from the ancient rule were made in
favor of what are sometimes called trade fixtures; by which is meant all those additions which the tenant of a house or land makes for the purpose of carrying on his trade or business. It cannot now be denied that a very wide power of removal has been allowed to tenants in cases of this kind. To illustrate this by instances: it has been adjudged that a tenant might take away (having put them on the land for purposes of trade or manufacture) furnaces, iron backs to chimneys, grates, pumps, vats, cisterns, copper and lead, steam and gas machinery, or even sheds, shops, and other buildings, and the like, even when these things are built into brick walls or roofs, or set on stone or brick foundations. Indeed, we doubt whether the courts of the United States would now stop short of saying that any implements or instruments of trade may be taken away by an outgoing tenant, if he can remove them and restore the premises substantially to their original condition. Not long after the relaxation in favor of trade, it was admitted by the courts that many things might be taken away by an outgoing tenant which he had put up and fastened to the house, either for mere ornament or for domestic convenience. Under this head are now included a great variety of things, such as mirrors, marble slabs and chimney-pieces, window blinds, doors, windows, baths, gas pipes and lights, stoves, fire grates, and ranges. It is difficult to draw an exact line here, but it must be said that the law is not so liberal in permitting things of ornament or convenience to be removed as things of trade; and the rule is more strictly applied, that the premises are not to be disfigured or injured by the removal. There are certain things about which the adjudication is as yet conflicting, such as trees planted out, conservatories, hot-houses, and other structures for gardening. Here we should say that a nurseryman who put these things up for trade might certainly remove them, on the same condition of putting the premises in good order as before. But a mere tenant for occupation, who had put them on the land for his own enjoyment, might be obliged to leave them, although we incline to think that he would be permitted to take them away, leaving, of course, the premises wholly unimpaired by the removal.—The same thing will be a fixture as to some persons, but not as to others. Thus a man who sells a house most certainly sells with it, and therefore cannot take away from the buyer, very many things which an outgoing tenant who put them there may remove when he goes. Here the law, instead of being liberal, professes to be strict; and the seller would be permitted to claim and sever from the land only those things which were originally an appurtenance to his trade or business. To it are appended many articles of furniture. And if he had fastened any things down, so as to give them the appearance of being a part of the house, it might be doubted whether he would be permitted to remove them. The same strict rule would be applied as between the heir who takes the land and the executor or administrator who takes the personal estate; and so it would be between lending and borrowing mortgages. Indeed, it may be said, in general, that in the matter of fixtures the law is extremely liberal as to the right of outgoing tenants to remove things of trade, and nearly as much so as to the same persons in respect to things of convenience or ornament; but very strict as to any disposition made of the land by the owner of it. In these rules, it is supposed, the law gives effect to the actual intent of the party attaching the article to the land; the owner being supposed to intend it to remain, because at the time he can generally have no interest in having it considered a severable chattel, while the tenant in making a similar annexation may be supposed to have his own interest in view, which could only be subserved by retaining the ownership in himself instead of making the thing annexed a part of the landlord’s estate. The general rule is that a tenant must remove during the term all he has a right to take away; and whatever he does not remove he is considered as having intended as a permanent fixture, though if he removes them before finally surrendering possession it will probably be sufficient, and a tenant at will or other tenant whose lease is determined by the will of the landlord, or by some other event unexpectedly, would be entitled to a reasonable time in which to exercise this right. It is common and very prudent to provide in leases for the removal of articles which the tenant expects to put up and take away.

FLACIUS (originally VLAICH), Matthias, sur
named ILYRICUS, a German Protestant theologi
ian, born at Albina, Istria, about 1550, died in Frankfort in 1675. He was induced to
abandon his original intention of entering a
convent, and to visit the German universities.
At Wittenberg he heard Luther and Melancho
thon, adopted their opinions, and was
appointed professor of Hebrew. After the
death of Luther he resisted the formulary
known as the Interim, opposed the conciliatory
measures of Melanchthon, and established him-
self at Magdeburg at the head of a party of
rigid Lutherans. In 1558 he was appointed
professor of theology in the newly founded
university of Jena, and engaged in a violent
dispute with Strigel concerning hereditary sin
and the synergetic power of the human will,
which resulted in his being deposed. He re-
tired to Ratisbon, and afterward preached in
several German cities. He was one of the
most prominent of the reformers, and besides
producing numerous polemical writings, dis
tinguished for their severity, was the origina-
tor and one of the principal authors of the fa
moys “Centuries of Magdeburg.”

FLAG. 1. The common name of a large family
of the lowest order of plants, known as algae.
These algae have all flagging habits, like the
common seaweeds, which are usually fixed to
rocks by their roots, while their branches are borne up by the tides, falling again and lying in confused masses one upon another at its recess. The propriety of this homely term is better seen in the uva or laver, of which uva latissima, very common on the American coast, having a broad, ovate or oblong, undulated, bright green frond, may be seen lying on the soft ooze at low tide, and floating near the bottom at high water. Enteromorpha, with tubular, membranaceous, green, netted fronds, is still more flaccid, and is easily collected from rocks and beaches, when thrown up by the winds. A rich, dark purple kind developed bright crimson and red kinds, or in the fuscos and inelegant fuci, and in the larger forms, equaling in size trees and shrubs, the name of flags is not an inapt one. II. Besides these lower plants, the name of flag is given to the iris family, which bear conspicuous flowers, some of great splendor. (See Iris.) III. The sword flags are stiff, erect, very long-leaved plants, with spikes of extremely showy purple, scarlet, rosy, or white blossoms, and with large flat tubers (corms), requiring heat, moisture, and sunshine while growing, but entire rest and dryness when dormant. Natives of the Cape of Good Hope, few gar-
Standards are mentioned frequently in the Bible. The Hebrews who went up out of Egypt were marshalled under distinctive banners. According to tradition, the four leading tribes, Reuben, Ephraim, Judah, and Dan, bore as devices respectively a man, an ox, a lion, and an eagle. From the most ancient times the dragon has been the chief symbol of China, Japan, and other eastern nations. It was also a prominent device among the Celtic, Germanic, Scandinavian, and Slavic tribes. At first, like many other emblems used for standards, it was of metal or carved wood, but in time was displayed upon a banner. It was the device on the banner of Harold at the battle of Hastings, and was borne by several other English monarchs.—The earliest flags proper were probably square cloths of a single color; but as nations multiplied parti-colors and different combinations were adopted to secure variety, and finally the devices or bearings of chieftains or of tribes were added. In modern times flags of a single color have generally a universally accepted meaning: thus, a white flag is a token of peace, a red of defiance; a black flag denotes piracy, or is sometimes hoisted to indicate that no quarter will be given or taken; a yellow denotes quarantine. Ancient standards were of many shapes, some square, some long and pointed, some swallow-tailed, and some ending in many points. The banner which Charlemagne received from the pope was oblong and split into three points; the oriflamme of France was of the same shape with five points. The standards of Henry VIII. of England were long pointed streamers rather than flags. Nearly all the standards and ensigns of modern nations are rectangular, but there are some exceptions. The naval flag of Sweden has three points, that of Denmark two, and the flag of China is triangular. Some of the principal European nations have each two or more flags, a royal or imperial standard, a national ensign, a naval ensign, and a flag for merchantmen. Royal and imperial standards are never hoisted except on occasions of great ceremony, when the sovereign or some member of the royal family is present, or on the sovereign's birthdays.—The royal standard of Great Britain displays the heraldic insignia of England, Scotland, and Ireland, quartered, the field of the first and fourth quarters red, the second yellow, and the third blue. The national flag, called the "union jack," is blue, charged with the three crosses of St. George, St. Andrew, and St. Patrick. The cross of St. George is red on a white field, of St. Andrew a white salter (diagonal cross) on a blue field, and of St. Patrick a red salter on a white field. The union jack adopted by James I. in 1608 combined only the first two, but on the union with Ireland in 1800 the cross of St. Patrick was added. This is the union jack which forms the canton in the British naval and commercial flags. The word jack is derived by some from the jacquet or surcoat charged with St. George's cross,
worn in the crusades by English soldiers, which name became in time transferred to the cross itself, and finally to the flag bearing the cross. Others derive it from Jac., the abbreviation of Jacobus, the Latin form of James. —In the 13th century the standard of France was white, sprinkled with golden fleurs de lis. Henry IV., the founder of the house of Bourbon, adopted the white flag charged with the escutcheon of his family, three golden fleurs de lis on a blue shield. This is the flag contended for so earnestly by the count de Chambord. It was succeeded early in the revolution by the tricolor, which was constituted the national standard by law in 1792. This is generally said to be the union of the blue banner of St. Martin, the red oriflamme of St. Denis, and the cornette blanche which succeeded the latter; but it is probable that its adoption was accidental. The red and blue, the colors of the city of Paris, were chosen first, and the white of the royal standard was added afterward. When this flag was first displayed there was no accord in the arrangement of the colors, and the stripes were sometimes placed horizontally instead of vertically. The present mode was prescribed finally by law. Napoleon adopted for the imperial standard the tricolor sprinkled with golden bees and charged with the eagle of France. At the restoration the white flag returned with royalty. The hundred days brought back the tricolor, but the white flag again succeeded it in 1815, and on April 18, 1816, it was decreed to be the national standard of France. The revolution of 1830 restored the tricolor, and it has since remained the national flag.—The imperial standard of Germany is white charged with a black cross, with the black eagle of the empire at its intersection. In the dexter canton is the cross of Prussia on a black, white, and red field. The Russian imperial standard is yellow charged with the double-headed eagle of Constantine the Great, symbolic of the Eastern and Western empires. This emblem was adopted by Ivan I. on his marriage with a princess of the Greek imperial house. On the breast of the eagle, which is black, are emblazoned the ancient arms of Russia, St. George and the dragon, on a red field, now the arms of the city of Moscow. The imperial standard of Austria is yellow also, charged with the double-headed eagle of the Roman empire, but it has an indented border of gold, silver, blue, and black. The Austro-Hungarian national ensign is formed of three equal horizontal bars, the chief red, the middle white, and the base red, in the dexter half and green on the fly. The green is added for Hungary, the national colors of which are red, white, and green. The middle bar displays a shield, charged with red, white, and red, surmounted by the imperial crown. The royal standard of Italy is green, white, and red, in equal vertical bars, the red to the fly; on the white are the arms of Savoy surmounted by the crown. The royal standard of Spain in the time of Ferdinand and Isabella displayed the arms of Castile, Leon, Aragon, the Two Sicilies, and Granada. Under the Bourbons it combined the arms of Castile, Leon, Granada, and the fleurs de lis of Bourbon. The standard fell with the monarchy, and in December, 1873, the republic ordered the removal from the naval ensign of the royal insignia. The royal standard of Portugal is red, charged with the arms and crown. The royal standard of the Netherlands is the same as the merchant flag, with the royal arms on the white bar. The Belgian royal standard is the same as the ensign, with the arms on the yellow division. The ensigns of Sweden and Norway are formed of the united flags of the two countries. The flag of Sweden is blue with a yellow cross, that of Norway red with a blue cross. The two, combined in the manner of the union jack of Great Britain, are cantoned in the national ensigns. The Danish merchant flag is the same in color and device as the naval ensign, but is rectangular. The same remark applies to the merchant flag of Sweden. The commercial flag of Greece is the same as the naval, omitting the crown on the cross. The royal standard of Greece is blue charged with a white cross, the canton of the ensign. The crescent and star of Turkey was the device of Diana Byzantina, the patroness of Byzantium, and was hoisted first by Mohammed II., after the capture of Constantinople.—The English colonies in America displayed at first the flag of the mother country, the cross of St. George. In 1636 Endicott, the Puritan governor of Massachusetts, cut the cross out of the banner to show his hatred of Romanism. In 1637 the king's arms were substituted for the obnoxious emblem; but in 1651, the parliament of the commonwealth having revived the old standard of St. George, it was ordered by the general court to be used on all necessary occasions. Various modifications were in use at different times. Sometimes the field was white charged with the cross, sometimes red with the cross cantoned on a white field, and sometimes blue with the cross similarly cantoned; and occasionally a globe or a pine tree was depicted in the upper canton formed by the cross. The flag of New England under Sir Edmund Andros was white charged with St. George's cross, bearing in the centre the letters J. R. (Jacobus Rex) surmounted by the crown. In 1707 the union jack of King James was adopted, and distinctive colonial flags probably went out of use. In the beginning of the revolution a variety of flags were displayed in the revolted colonies. The "union flags" mentioned so frequently in the newspapers of 1774 were the ordinary English red ensigns bearing the union jack. These generally bore some patriotic motto, such as "Liberty," "Liberty and Property," "Liberty and Union," &c. After the battle of Lexington the Connecticut troops displayed on their standards the arms of the colony with the motto Qui transit sustinet; and later, by act of the provincial congress, the regiments were distinguished by the colors of

their flags, aa, for the 7th blue, for the 8th orange, &c. The early armed ships of New York are said to have displayed a beaver, the device of the seal of New Netherland, on their ensign. It is uncertain what flag, if any, was used by the Americans at Bunker Hill. That displayed by Putnam on Prospect hill on July 18 following was red, with Quis transitut currit in se on one side, and on the other, “An Appeal to Heaven.” This last motto was adopted, April 29, 1776, by the provincial congress of Massachusetts as the one to be borne on the flag of the cruisers of that colony, “a white flag with a green pine tree.” What flag Arnold carried in the expedition to Canada is not known. The first armed vessels commissioned by Washington sailed under the pine-tree flag. The first republican flag unfurled in the southern states, blue with a white crescent in the upper corner next to the staff, was designed by Col. William Moultrie of Charleston, at the request of the council of safety, and was hoisted on the fortifications of that city in September, 1776. The flag displayed on the E. bastion of Fort Sullivan, afterward called Moultrie, on June 28, 1776, was the same, with the word “Liberty” on it. On the bastion waved the flag called the “great union,” first raised by Washington at Cambridge, Jan. 2, 1776. This consisted of the 13 alternate red and white stripes of the present flag of the United States, with the crosses of St. George and St. Andrew emblazoned on the blue canton in place of the stars. This flag was carried also by the fleet under command of Commodore Esek Hopkins, when it sailed from the Delaware capes, Feb. 17, 1776. Hopkins had displayed previously a yellow ensign bearing the device of a rattlesnake in the attitude of striking, with the motto “Don’t tread on me.” This emblem was suggested probably by the cuts displayed at the head of many newspapers of the time, which represented a snake divided into 13 parts, each bearing the abbreviation of a colony, with the motto beneath, “Join or Die,” typifying the necessity of union. The snake was represented generally with 13 rattles; sometimes it was coiled around the pine tree at its base, and sometimes depicted at length on a field of 13 alternate red and white or red and blue stripes. The official origin of the “grand union” flag is involved in obscurity. At the time of its adoption at Cambridge the colonies still acknowledged the legal rights of the mother country, and therefore retained the blended crosses of St. George and St. Andrew, changing only the field of the old ensign for the 13 stripes emblematic of their union. The colors of the stripes may have been suggested by the red flag of the army and the white one of the navy, previously in use. These 13 stripes are supposed to have been used first on a banner presented in 1774 or 1775 to the Philadelphia troop of light horse by Capt. Abraham Markoe, and still in the possession of that troop. After the declaration of independence the emblems of British union became inappropriate, but they were retained in the flag until the following year. Congress resolved on June 14, 1777, “that the flag of the United States be 13 stripes alternate red and white; that the union be 13 stars, white in a blue field, representing a new constellation.” This is the first recorded legislative action for the adoption of a national flag. The resolution was not promulgated officially until Sept. 8, although the newspapers published it a month earlier. It is supposed that the flag was unfurled first by Paul Jones on the Ranger, to the command of which he was appointed on the same day that the resolution regarding the flag was passed. It is not known by whom the stars were suggested. By some they have been ascribed to John Adams, and by others it has been urged that the entire flag was borrowed from the coat of arms of the Washington family; but both conjectures are without proof, and the latter is improbable. The 13 stars of the flag of 1777 were arranged in a circle, although no form was prescribed officially. The flag thus adopted remained unchanged till 1794, when, on motion of Senator Bradley of Vermont, which state, with Kentucky, had been admitted into the Union, it was resolved that from and after May 1, 1795, “the flag of the United States be 15 stripes alternate red and white, that the union be 15 stars, white in a blue field.” This was the flag used in the war of 1812-14. The act made no provision for future alterations, and none were made till 1818, although several new states had meanwhile been admitted into the union. In 1816, on the admission of Indiana, a committee was appointed “to inquire into the expediency of altering the flag.” A bill was reported, Jan. 2, 1817, but was not acted on, which embodied the suggestions of Capt. Samuel O. Reid, distinguished for his defence of the brig General Armstrong against a superior British force in Fagay roads in 1814, who recommended the reduction of the stripes to the original 13, and the adoption of stars equal to the number of the states, formed into one large star, and a new star to be added on the 4th of July next succeeding the admission of each new state. On April 4, 1818, a bill embodying these suggestions, with the exception of that designating the manner of arranging the stars, was approved by the president, and on the 18th of the same month the flag thus established was hoisted on the hall of representatives at Washington, although its legal existence did not begin until the following 4th of July. In 1859, when congress passed a vote of thanks to Capt. Reid, the designer of the flag, it was suggested that the mode of arrangement of the stars should be prescribed by law, but the matter was overlooked. The stars in the unions of flags used by the war department of the government are generally arranged in one large star; in the navy flags they are invariably set in parallel lines. The blue union, which now contains 87
FLAGGANTS, a name given during the middle ages to various societies of penitents, who went about scourging themselves in public. The first organization of this kind arose in 1056, and was due to St. Peter Damian; and his efforts were crowned with such success that persons were everywhere seen scourging and lacerating themselves to appease the wrath of heaven. This practice, though disowned by the ecclesiastical authorities, became more and more prevalent. In 1260 the calamities consequent upon the long wars between Guelphs and Ghibellines impressed the popular mind with the belief that the end of the world was at hand, and a guild of flagellants was founded in Perugia by one Rainer, a Dominican friar. A branch society was soon after established in Rome, and thence rapidly spread throughout Italy. Vast bodies of men, girded with ropes, marched in procession through the streets, and from city to city, singing inhuman chants, scourging their naked shoulders, and calling on the people to repent. All hostilities ceased; and the effect of this display, though not lasting, was at first irresistible. Such processions spread from Italy to other countries. In 1261 large numbers of flagellants were seen in Austria, Hungary, and Poland, scourging themselves publicly during 33 days in memory of the 33 years of Christ's life upon earth. These displays were repressed for the time by the civil magistrates; but they recommenced on a larger scale about 1849, when all Europe had been desolated by the "black death." The flagellants, who proclaimed that Christ was about to come back on earth, that the world was to be purified by the baptism of blood, and that flagellation was to be the sole sacrament of this new era, these fanatics spread all over Europe, and a band of 120 reached London in the time of Edward III., but found no sympathy among the English people. On the continent women and boys joined in these processions. But to the excesses which characterized their devotion were soon added disorders of every kind. In several places they excited the populace to rise against the Jews, whom they represented as the cause of the "black death." In 1849 Pope Clement VI. issued a bull against them, and in 1873 they were denounced as heretics by Gregory XI. Early in the 19th century they reappeared in Germany; but their leader, Conrad Schmidt, was burned as a heretic in 1414. In France the celebrated Gerson wrote against them in the name of the university of Paris, and a royal edict forbade their processions. In Italy and Spain some good men, like Vincent Ferrer, endeavored to encourage the practice of public flagellation, while restraining every excess and disorder; but after the council of Constance the flagellants disappeared from European history. The name of flagellants was also given to some pious guilds in Catholic countries, approved by the ecclesiastical authorities, but which are now almost entirely extinct. In southern France they existed under the name of the white flagellants (blancs battus) down to the reign of Henry III., who established a branch of them in Paris, and joined them, with several of his most licentious courtiers. This effectually extinguished them. See Muratori, Antiquitates Italicæ Medii Ævii; and especially Förstemann, Die christlichen Geistergesellschaften.
ing of the Atlantic Cable," and "Washington receiving his Mother's Blessing." Mr. Flagg has suffered much from ill health, and his efforts have been in consequence unequal. Il. Jared Bradley, an American artist and clergyman, brother of the preceding, born in New Haven, Conn., June 16, 1820. He studied for a short time with his brother, and had some instruction also from Washington Allston. When but 16 years old he exhibited in the national academy a portrait of his father. He settled in Hartford, where he painted many portraits and a few other pictures. In 1849 he removed to New York, and the following year the exhibition of his "Angelo and Isabelita" from "Measure for Measure" secured his election as an academian. He afterward studied theology, and in 1854 was ordained deacon in the Episcopal church. Since then he has been pastor of several churches, and has found time also to paint many pictures.

**FLAHAUT DE LA BILLARDERIE**

1. **Auguste Charles Joseph**, count, a French general and diplomatist, born in Paris, April 21, 1765, died there, Sept. 2, 1870. His father succeeded Buffon as director of the jardin des plantes, and was executed by the revolutionists. The property of his widow was confiscated. In 1800 Flahaut joined the army in Italy, became successively aide-de-camp of Murat, Berthier, and Napoleon, fought in Portugal, Russia, and Germany, and gained particular distinction at the battle of Leipzig, on which occasion he was made general of division, with the title of count. During the hundred days he was created a peer, and took part in the battle of Waterloo. After the revolution of 1830 he was reinstated in his rank and title. In 1831 he was for a short time ambassador in Berlin, and officiated in the same capacity in Vienna from 1841 to 1848. On the coup d'état of Dec. 2, 1851, he became a member of the consultative commission, in 1859 senator, in 1854 a member of the corresponding society of Napoleon I., and in 1860 ambassador to London. He married on July 28, 1817, Margaret Mercer Elphinstone, who succeeded to the peerages of the United Kingdom and Ireland as Baroness Keith in 1823, and to the Scottish barony of Nairn in 1838. The salon of Mme. de Flahaut was a favorite resort of eminent politicians. The count was one of the intimate friends of Louis Napoleon's mother, Queen Hortense, who is said to have composed for him her popular air Partant pour la Syrie; and he was believed to have been the father of M. de Morny. Il. Adèle Fillien, a French author and heroine of the preceding, born in the château of Longpré in Normandy, May 14, 1761, died in Paris, April 16, 1856. Her second husband was the marquis José Maria de Souza Botello, born in Oporto, March 3, 1778. He was in Paris, January 16, 1822, and for some time Portuguese ambassador in Paris, and who prepared a valuable edition of Camoëns's Lusiad." Her first and best work, Adèle de Sévanges, ou Lettres de Lord Sydenham, appeared in London in 1794, with a preface by the marquis de Montesquieu. It was followed in 1799 by Émilie et Aphonase, and by a series of other works, a complete edition of which appeared in Paris in 1819-12 (6 vols. 8vo, and 12 vols. 12mo). A charming representation of the best French society in the 18th century is found in her writings.

**FLAMBOROUGH HEAD**, a promontory on the coast of Yorkshire, England, in lat. 54° 7' N., lon. 0° 6' W. It is a range of steep and in some places perpendicular chalk cliffs, some of which rise to a height of 460 ft. On the headland stands a lighthouse 214 ft. above the sea, with a revolving light visible at a distance of 30 m. The cliffs are perforated by numerous caverns, which during the summer are resorted to by immense numbers of sea fowl. The ruins of an ancient tower and a Danish intrenchment are on the summit, and Flamborough village stands near the centre of the promontory.

**FLAME**, the luminous appearance caused by the combustion of gases or vapors. When a liquid or solid is burned so as to form a flame, it is first converted into gas or vapor. The small blue flame which appears upon burning charcoal is caused by the union of atmospheric oxygen with the carbonic oxide gas which is the first product of the union of oxygen with carbon. The structure of a flame is best observed in the burning of a sperm or tallow candle, or an oil lamp having a solid wick. In the candle flame, represented in section in fig. 1, the central dark inner cone a, surrounding the wick and proceeding to a point a short distance above it, is chiefly composed of light and heavy carburetted hydrogen gases, formed by the action of heat on the hydrogen of the blowpipe gases which are contained in common illuminating gas, of nitrogen obtained from the air, of watery vapor, and also of carbonic oxide and carbonic acid gases. In the blue zone, b, at the base of the flame, the gas of the base of the inner cone is completely burned by oxygen less rared than that which reaches other parts of the flame. This zone has the same character as the inner flame of the blowpipe. That part of the flame which furnishes the principal part of its light is called the luminous cone, represented at c. Its base surrounds the inner cone, its apex reaching above it. It is luminous in consequence of the incandescence of numerous minute particles of solid carbon which have been formed by the abstraction of the constituent hydrogen of the carbo-hydrogen gas, and its union with atmospheric oxygen. The supplied oxygen to the inner parts of this flame is not sufficient to consume the carbon, but the combustion of hydrogen furnishes sufficient heat to produce white light in
the particles of solid carbon. The combustion is completed in the outer cone, d, by the union of carbon and remaining un consumed gases, with atmospheric oxygen. It is called the mantle, and is much less luminous than the cone last described, the light being principally caused by incandescent gas and vapor. This part of the flame is sometimes confounded with the blue zone at the base, but the mistake can readily be demonstrated by holding a piece of cardboard between the eye and the flame in such a way as to cut off the luminous cone, and thus enable the difference in the character of the light of the two cones in question to be distinguished. The flame of a lamp wick is of course similar to that of a candle; and a flat flame has the same structure, only the part corresponding to the inner cone is very thin. The blue-colored parts of an ordinary flame are chiefly owing to the combustion of carbonic oxide gas, which may be considered as the transition state of the carbon element during its complete union with atmospheric oxygen and formation of carbonic acid. The upward current of heated gas produced by a flame burning in air, undisturbed by external currents, is quite rapid, as may be observed when smoke is allowed to be carried up with it, and the resistance which it offers to horizontal currents is considerable. The structure and composition of a candle flame may be demonstrated in several ways. If a fine metallic wire is passed horizontally through the centre, it will soon become incandescent in the luminous cone and mantle on each side of the flame, while that part which is in the dark inner cone will slowly become only slightly red from conduction of heat, or not at all if the wire is very small. If the wire is of steel or iron, after being held for some time in the flame it will be found on examination to have become corroded at those points which were in the mantle and outer part of the luminous cone, in consequence of combining with atmospheric oxygen, which it readily does under the influence of incandescent heat. That part of the wire which is in the inner cone will not be affected, while that part which is in the inner part of the luminous cone will be covered with lampl black. If a silver or copper wire which has had the surface tarnished by oxygen be employed, the tarnish will disappear at those points which are in the inner part of the luminous flame, because the oxygen which had united with the metal is now taken up by the heated free carbon in the flame. In the outer cone or mantle the coating of oxide will be increased. This furnishes an explanation of the nature of the common or mouth blowpipe flame, which is produced by blowing a fine stream of air through the flame of an oil or alcohol lamp or a candle, fig. 2. The tip of the blowpipe is usually introduced into the inner cone, and air from the mouth is forced through it, which mingles atmospheric oxygen with the combustible gases, and produces complete combustion of all those portions in the line of the jet. The whole flame is directed by the current of the jet, and a current of air surrounding it also passes in the same direction. The whole of the gases of the inner cone are not consumed by the air blown through the pipe (unless it be too large), but a portion is left to be consumed in the luminous outer hollow cone, e, where it meets with the oxygen of the air. As the oxides of metals are reduced to a metallic state by paring with oxygen to the carbon, the inner flame e is called the reducing flame, and its point b is also the hottest point in the whole flame. The outer cone is the oxidizing flame, which varies in quality in different portions, the most effective point for most purposes of oxidation being at the tip, although the flame is used in a variety of ways, depending upon the material under examination and the nature of the substance in which it is held. If a piece of fine wire gauze is held in a horizontal position and lowered into the flame, the latter will only continue to burn below it, the un consumed gases passing through, but without sufficient heat to burn. A central dark circle, a section of the inner cone, will then be observed, and also a luminous outer ring, formed of the luminous cone and the mantle. (See fig. 3.) If, while the gauze is held in the flame, a lighted taper be applied to the upper surface, the un consumed gas will take fire, and the original flame will be nearly restored, the gauze forming a horizontal section. If the flame be extinguished by the breath, and while theick is smoking the gauze be quickly placed a short distance above it, and a lighted taper applied to the upper side, the ascending combustible gases which still issue from the wick and pass through the gauze will take fire, producing a flame above it, which will not extend beneath because the gauze conducts away the heat sufficiently to prevent ignition of the column of gas below. This phenomenon, however, will only last a moment, as the wick soon ceases, in the absence of heat, to furnish combustible gases. The experiment can be better made over a jet of common illuminating gas. (See fig. 4.) The flame above the gauze will not be so distinctly divided nor so luminous as in an entire flame, because of the partial mix-
tume of oxygen with the combustible gases before passing through the gauze.—If one end of a small glass or metal tube, open at both ends, be introduced into the inner cone of a candle flame, and the other end elevated and a lighted taper applied to it, a second flame will be pro-
duced from the combustible gases which have been conveyed off by the tube. (See fig. 5.) It is by the use of such a tube, only longer, and bent so as to pass under water and into collecting vessels, that the gases are collected for analysis. Bunsen's burner, fig. 6, furnishes an example of the effect of a free and full supply of oxygen to a burning gas. The carbon being consumed almost simultaneously with its hydrogen constituent, scarcely any separation of solid particles occurs, and therefore there is but little light other than that produced by the incandescent gases and vapors. Conversely, the luminosity of a flame may be increased by the addition of substances rich in carbon. If hydrogen gas or light carbureted hydrogen be passed through naphtha or benzole, its flame may be rendered highly luminous. So also the addition of a substance, as chlorine gas, which has the power of abstracting the constituent hydrogen from a carbo-hydrogen gas and setting free the carbon, will increase the luminosity of a flame.—Increase and diminution of pressure have been found by Frankland to have a remarkable influence upon the luminosity of flames. On the summit of Mont Blanc candelas burn with a feeble light, and in artificially rarefied air it has been found that the brightness of ordinary flames increases or diminishes in proportion to the increase or diminution of pressure, down to that which supports a column of mercury of 14 inches. Below this pressure the luminosity diminishes at a less rate than the pressure. Under increased pressure a
widow of some property, and also received pupils in his house, to whom he taught writing and the rudiments of letters. The means which he thus acquired were profitably invested, and the products of his industry and rents enabled him to build hospitals and free lodging houses, found chapels, and endow churches, which he often adorned with paintings and sculptures, especially with bass reliefs of himself and his wife. His fame increased after his death, and the attempt to account for a fortune which had been magnified by popular credulity resulted in attributing to him the possession of the philosopher’s stone. In 1681 the Sommaire philosopique, a metrical treatise on alchemy, was published probably by Gohorry, under the name of Flamé; and it completely established his reputation as an alchemist till Villain critically investigated his history (1781). It has been conjectured that the Jews, who were then much persecuted in France, made him the depositary of their wealth; or, which is still more improbable, that the cabalistic book of Habraham Juif, which he is said to have studied, contained emblematic signs of the various places where the Jews, expelled from the kingdom, had buried their treasures.

**FLAMEN**, in Roman antiquity, a member of an ancient college of priests, established by Numa, each of whom was confined to the service of a particular deity. The original three, the diais, martialis, and quirinalis, consecrated to Jupiter, Mars, and the deified Romulus, were afterward distinguished as majores, and chosen from a select class of the patrician order (see Confraternity); while the later 12, called minores, were elected from the plebeians. Their dignity was for life, but could be forfeited by neglect of duty, or lost in consequence of an ill-omened event disturbing any of their sacred performances. Their official dress was the apex, a cap either conical or close-fitting, having at the top a pointed piece of olive wood, surrounded at its base by a lock of wool (Alum, whence, according to some, their name, while Plutarch derives it from pileum, hat), the lama, or mantle, and the laurel wreath. The most distinguished member of this college of priests was the diais, honored with the privileges of a seat in the senate, the toga praetexta, a lictor, and the higher prerogative of procuring pardon or respite for criminals who came to him for refuge; but he was also burdened by several restrictions, being forbidden, for instance, to leave the city even for a single night, to swear an oath, to wear a ring, to ride or touch a horse, and to remarry after the death of his wife, who assisted him in the performance of some of his sacred functions, and was called flaminica. In later times the deified emperors of Rome had particular flamines appointed to their worship.

**FLAMINGO**, a wading bird of the order natores, family anatidae, subfamily phainopeitinae, and genus phainopeius (Linn.). The bill is longer than the head, high at the base, compressed, suddenly bent at a right angle in the middle, the sides growing narrower, and rather obtuse at the tip; the lateral margins are incurved and finely laminated; the base to around and behind the eye is covered with a soft and delicate skin, finer than the finest kid, the end being corneous; the nostrils are near the base, linear, 1½ in. long; length about 6 in.; beyond the curve the color is black, the base being orange and yellow. The wings are moderate, with the first and second quills nearly equal and longest; the tail is 6 in. long; the tibia is lengthened and naked; the tarsi are very long and slender, and both covered by transverse scales; the toes are short, the anterior ones united by a membranous web; the hind toe is very short, almost touching the ground, and free; the claws are short and flat. There are five or six species, inhabiting the warmer parts of the globe, frequenting the seashore and marshes in considerable flocks; one acts as sentinel while the rest are feeding or resting, and on the approach of danger gives the alarm by a trumpet-like noise, and starts off leading all the rest; they fly either in triangular lines like the wild geese, or in Indian file when they are about to alight; they can run quickly, but when walking are said to assist themselves by placing the upper mandible on the ground; though web-footed, they do not swim, the webs serving to support them in wading over soft mud. The food consists of mollusks, crustaceans, fish, spawn, marine insects, and small fish; the singular form of their bill enables them, by turning it toward the body, to place the upper mandible downward, and thus to collect their food as in the bowl of a spoon. The small head, angular bill, long and slender neck, stil-
that of each wing being 16½ in.; the tarsus 12½ in.; bill along gape 5 in., along the curve 6 in.; middle toe 8½ in.; the circumference of the body is only 24 in., and the weight about 7½ lbs.; the female is considerably smaller. The space between the bill and eye is bare, but the plumage generally is compact and the feathers rounded, those on the neck being short; the color is a bright scarlet, deepest on the wings; the quills are black, the legs red, the feet lake color, and the Iris blue. The habits of the flamingo are more nocturnal than those of the heron; over the water they fly low, but over the land very high, with neck and legs extended, alternately flapping their wings and sailing; but alighting they generally sail around the place, and come down in the shallow water, often wading to the shore; they are very shy. The nest is made on a hillock of mud about 2 ft. high, in the hollow top of which on the bare earth two or three white eggs are laid about the size of a goose egg; the bird covers the eggs standing, with one foot in the water, and the young are hatched about the end of May; they take to the water when little, but cannot fly till they are three months old; they do not attain their full scarlet plumage until the second year, being rose-colored during the first. On account of its shyness the flamingo is rarely hunted, and then only for its handsome feathers. It is easily tamed, and in captivity feeds on rice, maize, and similar substances. It inhabits the warmer parts of America, especially the West Indies; it is not uncommon in West Florida and northern Alabama, but is rare to the north and west of these points.—The European bird (P. antiquorum, Temm.) is smaller and less brilliant. It is a regular visitant to the shores of the Mediterranean, and sometimes wanders to France and Germany; it is extensively spread over the warmer parts of Asia, and is very common along the shores of northern Africa. Its appearance and habits are the same as those of the American species. According to Gould, this species requires four years to reach maturity, during which the plumage changes greatly; before the first molt the color is uniform gray, with black tail and secondaries; in the male, the head, neck, upper and under surfaces, are a delicate rosy white, the centre of the wing bright scarlet, the primaries black, the bill reddish at the base and black at the tip, the tarsi and toes rose red; the scarlet color is not assumed until the third or fourth year, and is brightest during spring and summer. The flesh of the flamingo is savory, and its fatty tongue is considered a delicious morsel; they were especially esteemed by the ancient Romans, and many allusions to this dish are found in their writings.—The position of the flamingo among birds is a subject of dispute; some authors place it among the waders or gravitatores, from its long neck and legs, and consequent habits; but the best authorities rank it among the anseres, or web-footed swimmers, on ac-
count of its lamellar duck-like bill, webbed feet, and muscular gizzard; if it be true that the young run to the water as soon as they are born, this of itself would seem to establish their rank among the anseres.

**FLAMMARION WAY** (Late via Flaminia), the principal road leading from ancient Rome to the northern provinces, constructed in 220 B. C., in the censorship of C. Flaminius, from whom it was named. It extended to Ariminum, now Rimini, on the Adriatic, about 220 m., where it joined the Æmilian way. It divided into two branches at Narnia, now Narni, in Umbria, which met at Fuligium (Foligno), again dividing at Nuceria (Nocera), and meeting at Fanum Fortunae (Fano). It had great commercial and military importance, and still retains many of the works erected by the Roman emperors.

**FLAMININUS, Titus Quintus,** a Roman general, born about 230 B. C., died about 175. He was elected consul in 198, and undertook the conduct of the war against Philip, king of Macedon. By pretending that his object was to remove from Greece the Macedonian yoke, he detached many of the Greek states from Philip, and defeated him at Cynoscephalae (197), in Thessaly, where the Roman legion demonstrated its superiority over the famous Macedonian phalanx. Philip surrendered all his Greek towns in Europe and Asia, and paid a heavy contribution to the Romans. At the Isthmian games in 196 Flaminius proclaimed the freedom of those states which had been subdued by Macedon. In 195 he diminished the power of the tyrant Nabis of Sparta, after which he occupied himself in restoring internal peace and prosperity to Greece. The next spring he returned to Rome, where his triumph lasted three days. In 188 he was sent as ambassador to Prussia, king of Bithynia, to seek the surrender of Hannibal, who had obtained an asylum there.

**FLAMININUS, Lucius,** a Roman general, killed June 28, 217 B. C. He was a tribune of the people in 232, consul in 233 and 217, and censor in 220. As tribune he carried an agrarian law against the opposition of the senate. In his first consularship he and his colleague attacked the Gauls beyond the Po, and were defeated. The senate then recalled the consuls, but Flaminius would not open the letter of recall, and obtained a victory over the Insubrians. A triumph was refused him on his return, but he was rewarded with demonstrations of popular favor. The circus Flaminius and via Flaminia were the monuments of his censorship. In his second consularship he marched against Hannibal, rashly gave battle, and was slain, with the greater part of his army, on the border of Lake Thrasymenus.

**FLAMMARION, Camille,** a French astronomer, born at Montigny-le-Bel, Haute-Marne, Feb. 26, 1842. He first studied theology and afterward astronomy, was attached as a pupil to the Paris observatory from 1863 to 1862, and
then became one of the editors of *La Cosmos*. In 1865 he was charged with the scientific department of the *Séculaire*, and he also became known as a lecturer, an aeronaut, and an advocate of spiritualism and other peculiar doctrines. He was eventually appointed professor of astronomy at the polytechnic association, president of the meteorological society, and member of several learned bodies. His principal works are: *La pluralité des mondes habitées* (1864; 16th ed., 1869); *Les habitants de l'autre monde* (2 vols., 1865–66); *Les mondes imaginaires et les mondes réels* (1865; 8th ed., 1866); *Les merveilles célestes* (1865); *Dieu dans la nature* (1866; 6th ed., 1869); and *Histoire du ciel* (1867). Several of his works have been translated into English, including his *Voyages aériens* (in Glaischer's "Travels in the Air," 1871), *Récits de l'infini* ("Stories of the Infinite," by S. R. Crocker, Boston, 1873), and *L'Astrophysique* (Paris, 1878), by C. B. Pitman, edited by J. Glaischer (London, 1873).

**FLAMSTEED, John**, the first English astronomer royal, born at Denby, near Derby, Aug. 19, 1646, died in Greenwich, Dec. 31, 1719. He was educated at the free school of Derby, and at a very early age manifested a strong inclination for astronomical studies. His health was so delicate that he was not sent to a university, but continued for several years to prosecute his astronomical researches at home with great success. In 1667 he demonstrated the true principles of the equation of time, in a tract which Dr. Wallis appended to his edition of the works of Horrocks. Flamsteed appears to have been the first astronomer who brought into common use the method of simultaneously observing the right ascension of the sun and stars, a mode by which the true place of any star is determinable by means of meridional altitudes and transits. In 1669 he communicated to the royal society his calculation of a solar eclipse that had been omitted in the ephemerides for the following year, together with several other astronomical observations. In 1710 he visited London, and was introduced to the savants of the metropolis. He then entered Jesus college, Cambridge, and made the acquaintance of Wroe, Barrow, and Newton. In 1673 he composed his treatise on "The True and Apparent Places of the Planets when at their Greatest and Least Distance from our Earth," a work of which Newton availed himself in his first edition of the *Principia*. In 1674 appeared his *Ephemeris*, which, with two barometers previously constructed by him, was presented by his friend Sir Jonas Moore to Charles II. and his brother the duke of York. In 1675 he was admitted to holy orders. Soon afterward, the king's attention having been called to the situation of the astronomers, and the deficiencies of the astronomical tables then in use, he resolved to found an observatory, of which Flamsteed, through the mediation of Moore, was appointed the first director. The observatory was completed in 1676, but the astronomer had already entered on the discharge of his duties in Greenwich. The new observatory received the name of Flamsteed house. It was so inadequately supplied with astronomical apparatus that its principal, out of his salary of £100 a year, often not regularly paid, and his other limited resources, had to provide most of those instruments which were indispensable. Here Flamsteed composed his great work, *Historia Coelestis*, the period of whose publication forms an epoch in the annals of modern astronomy. In 1684 he was presented to the small living of Buralon in Surrey, the only ecclesiastical preferment he ever obtained. Mr. Francis Baily's discovery of his papers and correspondence in 1832, published in 1835 by authority of the admiralty, has thrown much light on the history of his differences with Newton and Halley. These documents give us Flamsteed's version of these unseemly controversies, and it is not at all favorable to the reputation of those great masters of science; but there is another account in Sir David Brewster's "Memoirs of the Life, &c., of Sir Isaac Newton," which makes their conduct toward him appear less culpable, though neither just nor generous, than Flamsteed would lead us to suppose. His *Historia Coelestis Britannica* (5 vols. fol., London, 1725) was not published complete till after his death, though a partial edition had been issued in 1712, against his protest, by Halley, under authority of a committee composed of Sir Isaac Newton, Sir Christopher Wren, and others. The first volume contains his observations on the fixed stars, planets, comets, &c.; the second, the transits of stars and planets over the meridian, with their places; the third, an account of the methods and instruments used by Tycho Brahe and himself, and various catalogues of fixed stars, including his own catalogue of 2,054 stars. He also prepared an *Atlas Coelestis*, as an accompaniment to the above work, which was published in 1729, and again in 1753.

**FLANDERS** (Flem. *Vlaanderen*, Fr. *Flandre*), formerly a part of the Netherlands or Low Countries of western Europe, now included in Belgium, Holland (the southern part of the province of Zeeland), and France (parts of the departments of Le Nord and Pas-de-Calais). Stretching along the North sea from the western inlet of the Scheldt to the entrance of the straits of Dover, it was bounded N. and E. by that river and its branch the Dender, while on the south it joined the province of Artois. The name occurs for the first time in the 7th century, when Eloi, bishop of Noyon and treasurer of King Dagobert I., visited northern Neustria. By the treaty of Verdun (843) Flanders was included in the kingdom of France, and about 20 years later the punches of the astro- nomer consider the rule of Baldwin the Iron Arm, son-in-law of King Charles the Bald. Baldwin's successors took rank among the six lay peers of France, and figured conspicuously in French history. His family having become extinct in
1119, the county was held till 1127 by Charles I., the Good, son of Canute, king of Denmark; then for a year by William Cliton, the nephew of Henry I. of England; and finally by Thierry, son of the duke of Lorraine, whose dynasty, known as the Alsatian, reigned till 1330. A last family of counts was established by Guy de Dampierre, and lasted till 1384, when Flanders was united to the states of Philip the Bold of Burgundy, who had married the heiress of the last count. At the death of Charles the Bold in 1477, his daughter Mary, by marrying the archduke Maximilian, brought Flanders to the house of Austria. It was incorporated by the emperor Charles V., among the 17 provinces which formed the circle of Burgundy. On this abdication it became one of the dependencies of Spain, which lost a portion of it by its northernmost section being annexed to Zealund when the seven United Provinces declared their independence. Afterward a portion of its southern territory was conquered by Louis XIV., and received the name of French Flanders. In 1718 the peace of Utrecht transferred Flanders from Spain to Austria. In 1792 it was invaded by the French, who held it till 1814, during which period it formed the departments of Lys and Scheldt. On the fall of the French empire, it was given to the king of the Netherlands, who divided it into two provinces, East and West Flanders, which since 1813 have constituted an important part of the kingdom of Belgium. In spite of so many revolutions, Flanders has always been distinguished for its industrial, commercial, and agricultural prosperity. As early as the 12th century its cities had acquired considerable importance through their manufactures, and had secured a certain degree of freedom. The democratic spirit kept pace with the progress of trade and industry; and in the following centuries the Flemish cities were so many republican communities, paying little more than a nominal obedience to their courts. They more than once took the management of affairs into their own hands, and successfully resisted their lord paramount, the king of France. Such was the case in 1387, when Jacob van Artevelde, the brewer of Ghent, expelled Count Louis I. of the country, caused his countrymen to acknowledge Edward III. of England as king of France, and held for a while the balance between the two great contending nations. Even when the cities of Flanders submitted to their sovereigns, they protected their liberties and privileges against any encroachment, revolting repeatedly during the 14th and 15th centuries. The interest of their lords, however, was to deal mildly with the subjects from whom they could obtain immense sums of money by voluntary taxation. It was through them that the house of Burgundy became the wealthiest in Europe, for they had then reached the height of their prosperity; many burgesses of Ghent, Ypres, and Bruges had princely fortunes, and plenty was apparent everywhere. Charles V., by forbearance and skilful management, conciliated the Flemings, and even the despotism of Philip II. could not entirely alienate them from Spain. Flanders is still a well cultivated country, famous for its industry and commerce, and forming the richest part of Belgium; but the indomitable spirit of old times has been tamed into a moderate love of political liberty.

(See Flemish Language and Literature.)

**Flanders, East**, a province of Belgium, bounded N. by Holland, E. by the Scheldt (separating it from the province of Antwerp) and by South Brabant, S. by Hainault, and W. by West Flanders; area, 1,158 sq. m.; pop. in 1871, 387,728. It forms an extensive plain, drained by the Scheldt and its tributaries, which, being united by canals, afford ample water communication. Its soil is not of superior quality, but is industriously cultivated, and it gives excellent crops of flax, hemp, wheat, rye, colewort, hops, beets, potatoes, and other vegetables. Great numbers of cattle are raised. Manufactures are prosperous, and comprise linen, woolen, and cotton, and beet-root sugar. Capital, Ghent; other chief towns, Oudenaarde, Dendermonde, Eecloo, Alost, and St. Nicholas.

**Flanders, West**, a province of Belgium, bounded N. by the North sea, S. W. and S. by France, and E. by the provinces of Hainault and East Flanders, and Holland; area, 1,349 sq. m.; pop. in 1871, 688,976. Besides the Lys and the Scheldt, by which it is watered on the southeast, it has only small streams emptying into the sea. Its surface is generally flat; and although most of its soil is sandy and poor, it has been so much improved that it yields abundant crops of wheat, oleaginous plants, flax, and tobacco. Cattle and horses are abundant. The manufacture of linen and damask is the principal industry. Capital, Bruges; other chief towns, Ostend, Furnes, Ypres, Courtrai, and Dinxmude.

**Flandin, Eugène Napoës**, a French painter and archaeologist, born in Naples, Aug. 15, 1809. His father was chief of the military commissariat under Murat, and settled in Paris after the downfall of Napoleon. Young Flandin studied drawing and painting without a master, visited Italy in 1834, and exhibited in 1836 "Venice" and the "Bridge of Sighs." In 1888, after a brief sojourn in Algeria, he painted the "Storming of Constantine," which became the property of Louis Philippe. In 1839 Flandin was chosen by the academy of fine arts to accompany to Persia the French ambassador De Serey; and on his return in 1849 his report and drawings were adopted by the academies and published by the government. He was at once chosen by the academy of inscriptions and belles-lettres to go to Nineveh with P. E. Botta to continue explorations there, and to sketch the monuments. He returned in 1845, and the chambers unanimously voted to publish the result of their labors, which appeared in the *Monuments de Niniees* and atlas (1849-50). In 1846, while preparing this...
work, he published articles relating to Assyria in the *Revue des Deux Mondes*. In 1864 he began the publication of another splendid work descriptive of the countries between Nineveh and the gulf of Persia. He has since exhibited many paintings on Italian and eastern subjects. He now lives in retirement at Tours. His works are: *Voyage en Perse* (2 vols. 8vo, Paris, 1851); atlas to the same (6 vols. fol., 260 plates in line engraving, and 100 lithographed plates, with descriptive texts, 1848-54); *L'Orient*, to be published in 40 parts of 5 plates each (parts 1 to 31, fol., 1855-57); and *Histoire des chevaliers de Rhodes* (large 8vo, Tours, 1864).

**FLANDRIN.** I. Jean Hippolyte, a French historical painter, born in Lyons, March 28, 1809, died in Rome, March 21, 1864. He was the son of an obscure miniature painter, and became a pupil of Ingres in 1829. In 1832 his painting of "Theseus recognized by his Father" won the grand prize, entitling him to spend five years in Rome, where he continued his study under Ingres, who had been appointed director of the French academy in that city. Devoting himself principally to historical subjects, he produced, among other compositions, "Dante in the Circle of the Envious" (1838), which won him a second-class medal, and "St. Clair curing the Blind" (1837). He returned to Paris in 1838; and in 1839 his "Christ blessing Little Children" obtained a first-class medal. Several remarkable portraits exhibited in 1840-41, and his first monumental frescoes executed in the church of St. Severin, Paris, now established his reputation; and he was employed by the chief cities of France and the government in decorating their most beautiful edifices. He was preparing cartoons for what he hoped to be the crowning labor of his life, the frescoing of the minister of Strasburg, when his health broke down in the autumn of 1863. He proceeded to Rome, where he was attacked by the smallpox, and died after an illness of three days. His principal frescoes and works in stained glass are in the chamber of peers and other national buildings, the church of St. Germain-des-Prés, Paris, and in the churches of Dreux, Lyons, Nimes, &c. His talent as a portrait painter was no less remarkable. Cornu has been intrusted with the completing of his frescoes in St. Germain-des-Prés, where a public monument to his memory has been raised by subscription.—See Vicomte Delaborde, *Lettres et pensées d'Hippolyte Flandrin*. II. Auguste, a French painter, brother of the preceding, born in Lyons in 1804, died there in 1842. He studied under Ingres in Paris and Rome, became a professor in the Lyons school of art, and obtained in 1840 a gold medal for his "Severалs preaching in San Miniato, Florence." III. Jean Paul, a French landscape painter, brother of the preceding, born in Lyons in 1811. He studied with his brothers under Ingres, obtained second prizes for his landscapes in 1839 and 1848, and a first prize in 1850. He also painted the baptistery of the church of St. Sevrin.

**FLATBUSH,** a town of Kings co., New York, bordering on Brooklyn; pop. in 1850, 3,977; in 1860, 3,471; in 1870, 6,309. It is the seat of the almshouse, hospital, lunatic asylum, and nursery of the county, and contains Dutch Reformed, Episcopal, Methodist, and Roman Catholic churches. Erasmus Hall academy in 1871 had 9 instructors, 121 students, and a library of 2,736 volumes. The town has been much improved within a few years, and numbers among its residents many business men of Brooklyn and New York. The battle of Long Island (August, 1776) was fought here.

**FLATHEADS.** I. A term applied at different times to tribes of Indians in widely distant parts of America, and incorrectly to the Belish, the tribe now known officially as Flatheads. The name is derived from the practice of flattening the skulls of their infants by various mechanical contrivances; the model of the deformity is the same in all the tribes, and much like that observed in the ancient Peruvian crania. The forehead is depressed and indented; the upper and middle parts of the face are pushed back so that the orbits are directed a little upward; the head is so elongated that in extreme cases the top becomes nearly a horizontal plane; the parietals are bent so as to form an acute angle, and instead of the occiput constitute the posterior portion of the head; the breadth of the skull and face is much increased, and the two sides are in most cases unymmetrical. The best known tribes which flatten the heads of their children are the Chinooks, Calapuyas, Clickitats, Clatsops, Cowalatsk, and Clatsanis. Among the Chinooks the child is placed in a wooden cradle, and a pad of grass is tightly bandaged over the forehead and eyes, so that it is impossible for him to see or move; and when bandaged and suspended in the usual way, the head is lower than the feet. A more crude way is practised in other tribes by binding a flat board obliquely on the forehead. These processes continued for several months produce the deformity, which, according to Dr. Pickering, disappears with age, so that most adults present no trace of it. This
shape of the head is so highly prized among the Chinooks that their slaves are not allowed to practise artificial flattening. The internal capacity of the skull is not diminished by the flattening, and the intellect is not affected, as all travellers agree that these nations are remarkably shrewd and intelligent; but it is said that they are particularly subject to apoplexy. The Chinooks are the best known of the Flatheads; they inhabit the S. shore of the straits of Fuca, and the deeply indented territory as far as the tide waters of the Columbia river. They are commonly diminutive, with ill-shaped limbs and unprepossessing features; the oblique eye and arched nose are occasionally seen among them; their complexion is darker than that of the more northern tribes who do not flatten the head. They have the filthy habits and the usual vices of the N. W. Indians, but are said to be superior to the hunting tribes of America in the useful and ornamental arts; their climate is comparatively mild and moist from the prevalence of westerly winds, and they are a fishing and maritime people. They differ from the northern tribes in language as well as in physical character. Dr. Morton, in plates 42 to 50 of the *Orante Americans*, gives descriptive illustrations of several skulls of the Columbia river tribes.—The custom of flattening the head is very ancient, but the modern Indians, except those of the N. W. coast, do not generally practise it; it was a custom in Peru before the arrival of the Incas, and was practised also by the Inca Peruvians to a comparatively recent date. It seems to have been principally employed by the Toltec branch of the American nations, including the semi-civilized race of Mexico, Peru, and Central America, and the ancient mound builders of the Ohio and Mississippi valleys; the Natchez tribe of Florida and the southern states, the Choctaws, and the Caribs (both insular and continental) flattened the skulls of their children by various devices, either in a vertical direction (as in the Natchez) or longitudinal one (as in the ancient Peruvians). Properly Sixitas, a small tribe of Indians, the most important and civilized branch of the Selish family. The origin of the name Flatheads as applied to them is unknown, as they do not flatten the head. They were visited by Lewis and Clarke in 1806-7, and are mentioned by the name of Hopipio. They resided on the Bitter Root or St. Mary's river, the largest tributary of Clarke's river, and numbered about 600. In 1830 they, with other Oregon tribes, were greatly reduced by pestilential fverns. Although a peaceful, industrious tribe, they became warriors to defend themselves against the Bannacks, Crows, and Blackfeet, but have never made war upon the whites. Hearing of Christianity from an Iroquois of one of the Canada missions, they sent three deputations to the Jesuits in St. Louis to obtain a missionary. Father F. J. De Smet went to the tribe in 1840, and began a mission which soon made the whole tribe Christians. They were poor, miserable, half starved, and nearly naked, living on fish and roots, and having no means of crossing rivers except their lodge skins; but they were willing to work, made rapid progress in agriculture, and have adopted the habits and dress of whites. They are remarkably sober and honest, and good warriors, although preferring peace. They were long governed by an excellent chief, Victor, regarded also as chief of the Pend d'Oreilles and Kootenays. The missionaries introduced agricultural implements, horses, and cattle, and the tribe prospered, being long without agents or traders. The treaty of Hellgate, July 16, 1855, approved by the senate on March 8, 1859, ceded all their lands without any consideration paid by government; and though it seemed to secure them their lands on the Bitter Root, yet under an order issued by President Grant on Nov. 14, 1871, they were removed to the Jocko reservation, which comprises 1,488,600 acres in the N. W. part of Montana. Of this tract the portion assigned to them is the worst. Any head of a family who would renounce tribal relations was permitted to take up 160 acres in the Bitter Root valley, and congress appropriated (June 5, 1872) $50,000 to pay for their houses and improvements there. It was also stipulated that 60 houses should be built for them, but only 11 were begun. Charlot, the chief who succeeded Victor, refused to sign the contract for the removal to the Jocko reservation. They have recently been attacked by the Sioux and lost many warriors. In 1872 they were reported at 460, which is evidently too low, with a school directed by missionaries and sisters of charity, and containing 29 pupils; they raised wheat, corn, oats, potatoes, and hay to the value of more than $7,000; had 1,500 horses, 800 cattle, and 250 swine. Their language is remarkably difficult. Its grammar has been published by Mengarini (New York, 1861). It is spoken with some dialectic differences by the Kalispels or Pend d'Oreilles, the Spokans, Courses d'Alènes, Kettlefall Indians, Okanagans, Ciallams, Lummis, and Shewshapmuck.

**LAFLAMBE, Gustave**, a French novelist, born in Rouen about 1831. He abandoned the study of medicine for literature, and published a licentious novel, *Madame de Bovary* (2 vols., Paris, 1857), which met with considerable success, partly owing to legal proceedings which were instituted against him for its alleged immorality, but which fell to the ground. Among his other works are *Salomé* (1862), a novel embodying the results of his explorations about Carthage, and *L'Education sentimentale, histoire d'un jeune homme* (3 vols., 1869).

**FLAVEZ, John**, an English clergyman and author, born at Bromsgrove, Worcestershire, about 1627, died in Exeter, June 26, 1691. He was educated at Oxford, became a curate at Ditford, and was called in 1666 to Dartmouth. He was one of the 2,000 clergy who refused to subscribe to the "Act of Conformity" passed in 1662, and was therefore
FLAX, the common name of the plant *Linum usitatissimum*, and also of its most important product, the filaments obtained from the fibrous covering of its hollow stems, used from the remotest times in the manufacture of linen threads. The coverings of the Egyptian mummies testify that the linen mentioned by the most ancient writers was the product of the flax plant. The seeds furnish fine seed oil; and of the residue, after this is expressed, is made the oil cake which is extensively used for feeding and fattening cattle. On account of its mucilaginous character, flax seed is also employed in medicine, its infusion in boiling water having a soothing effect in cases of inflammation of the lungs, intestines, &c.; and when ground to meal and mixed with hot water, it forms an excellent emollient poultice. The flax plant is a slender annual, from 2 to 3 ft. high, bearing small lanceolate leaves distributed alternately over the stalks. These terminate in dark blue flowers, which are succeeded by globose seed vessels of the size of small peas, containing each 10 seeds, brown, oval, and flat, and remarkably bright, smooth, and slippery. The husk of the seed yields 52-7 per cent. of a pure gum soluble in cold water; and the interior portion yields the peculiar oil already referred to. The plant, now cultivated in almost all parts of the world, is supposed by many to have been first known in Egypt, or possibly in the elevated plains of central Asia; but though no doubt a native of warm climates, the fibre attains its greatest fineness and perfection in temperate regions. The seed is richer in the tropics. Near the northern limits of its cultivation the product of the flax is abundant, but the quality is inferior. The flax of Holland and Belgium commands a higher price than that of Russia. This difference is owing partly to the extreme care given by the Hollander and Belgians to its preparation. The Irish, who have cultivated the crop from an early period, and who seem to possess as great natural advantages for its culture as any people, rarely furnish so valuable an article as the Belgians. The greater part of the importation is from Russia, and the countries bordering on the Baltic. The rich soil of the valley of the Nile is well adapted for its cultivation, and the product of Egypt is increasing under the encouragement given by the English, who find it more economical to procure their supplies from foreign countries than from their own.

—The New Zealand flax is obtained from the leaf of an endogenous perennial plant, *Phormium tenax*, which is a native of New Zealand and Norfolk Island. The leaves are from 2 to 6 ft. long and from 1 to 3 in. broad, and have a fine strong fibre, which was once used by the New Zealanders for making dresses, ropes, twine, mats, cloth, &c. This species of flax has been imported into Great Britain, where it has been chiefly used for making twine and ropes; but its importation is now unimportant and its price low.—Flax appears to have been cultivated in New Netherland as early as 1626. The seed of flax was ordered to be introduced into the colony of Massachusetts in 1629, and flax was cultivated in that state after the war of independence, particularly at a distance from the coast. Manufactories for making sail cloth were established at Salem and Spring- field in 1790. In Virginia flax was annually cultivated, spun, and woven by Capt. Matthews prior to 1648. Bounties for its production in that colony were offered in 1657. Flax was among the products for the encouragement of whose cultivation the British parliament made considerable grants to the patentees of Georgia in 1738, 1748, and 1749. Early attention was given to the cultivation and manufacture in Pennsylvania, Ohio, Kentucky, and Indiana. According to the census of 1870, the total amount of flax produced in the United States was 27,133,034 lbs., of which 17,880,624 lbs. were produced in Ohio, 8,670,818 in New York, and 5,204,606 in Illinois. The total amount of flax seed was 1,730,444 lbs., of which 631,894 were the product of Ohio. In 1873, 85,863 acres were sown with flax in Ohio, which produced 733,384 bushels of seed and...
FLAX

$4,477,361 lbs. of fibre. In 1870 there were in the United States 90 establishments for dressing flax, the products of which were valued at $313,010. Of these establishments, 46 were in New York and 27 in Ohio. During the year ending June 30, 1878, 4,171 tons of raw flax, valued at $1,127,727, were imported into the United States, the largest quantities being from England and Russia; and the imports of flax manufactures, chiefly from England and Scotland, amounted to $30,483,391.—

The manufacture of flax constitutes an important element of British industry. In 1871 there were in England and Wales 155 flax factories, with 866,708 spinning spindles and 19,810 operatives, of whom 12,614 were females; in Scotland the number of factories was 191, having 317,085 spinning spindles and employing 49,917 hands, of whom 38,900 were females; while in Ireland there were 154 factories with 866,485 spinning spindles and 55,089 operatives, of whom 47,700 were females. The imports of rough or undressed flax for 1872 amounted to 1,516,555 cwt., valued at $3,772,379. Most of this amount came from Russia, the imports from that country amounting to 1,115,804 cwt., valued at £3,690,610. Germany, Belgium, and Holland ranked next in order. In addition to the above, 176,789 cwt. of dressed flax, valued at £557,704, were imported, mostly from Belgium. In 1873 there were 187,360 acres planted with flax in the United Kingdom, of which 122,008 were in Ireland.—The flax crop thrives upon almost any good soil thoroughly pulverized and well drained, but more especially upon rich sandy loams regularly supplied with moisture during the spring months. In Ohio, three pecks of seed are sown to the acre, which yields from six to twelve bushels of seed and from one to two tons of straw, which is manufactured into tow for rope walks and paper mills. It may be sown very early in the spring, and to good advantage succeeding a crop of grass from it is gathered in July or early in August, another crop may be obtained from the same land during the season. A common practice with the Belgians is to sow the white carrot broadcast with the flax, and when the latter is gathered, which is done by pulling up the plants by the roots, the soil is loosened around the young carrots, and being then top-dressed with liquid manure, they thrive luxuriantly. Grass or clover seed is also often sown immediately upon the flax seed. The better soils take three bushels of seed to the acre, the poorer two bushels. The finest fibre is obtained by a thick growth of slender stalks. The Dutch take great pains to weed the crop by hand, when the plants are two or three inches high. In June the plants are in bloom, and the fields present a beautiful appearance, covered with the delicate blue flowers. The time for gathering is the leaves beginning to drop off, and by the bottom of the stalks becoming yellow; also by the condition of the seed bolls, which should be examined almost daily about the time of maturity of the crop. When the ripest on being cut open with a sharp knife do not appear within whitish and watery, but firm and dark green, the flax is fit for pulling. Soon after this the seeds would begin to fall, and the fibre would lose its silkiness and elasticity. But if it be desired to obtain seed for sowing, the plants must be allowed to fully ripen at the cost of the deterioration of the fibre. As the flax is pulled, it is gathered in bundles to dry; and then if the seeds are thoroughly ripened, they may be separated by the threshing mill. The ordinary course, however, is to strip the seeds by the process called rippiling, which is drawing the stalks, a handful at a time, through a set of iron teeth standing in a row, half an inch apart at top and a quarter of an inch at bottom. Four men with two rippiling combs will separate the seeds, it is estimated, from more than an acre of flax in a day. The seed bolls should be well dried, and then stored away in bags in an airy place. At convenient times they are threshed and winnowed to separate the seed from the capsules, preparatory to obtaining by expression the oil and the oil cakes. The culture of flax and its preparation for market involve more labor than almost any other crop. The seeds are preferred which are brought from Riga, and next to these the Dutch; the American produce a coarser stem. The soil should be thoroughly prepared by repeated harrowing after deep ploughing. The weeding requires peculiar care, that it may be sufficient without injury to the young plants. The soil should be kept rich by judicious manuring; for flax is commonly regarded as an exhausting crop. The plan of returning to the soil the water in which the stalks are steeped, by which it is estimated nine tenths of the nutrition matter taken away are restored, is highly recommended. The pure fibre yields no ashes, so that it takes nothing from the soil, and the manure of the cattle fed upon the flax will restore much of the solid constitutents of the seeds. Dr. Ure gives the following mixture of salts, "which it has been said will replace chemically the constituents of the plants produced from an acre of land, viz.: muriate of potash, 30 lbs.; common salt, 28; burned gypsum, powdered, 34; bone dust, 54; sulphate of magnesia, 58." The preparation of the flax for market finds occupation for the cultivators in the winter season; but this can be economically conducted only where many are engaged in the culture, and mills are provided with the requisite machinery. In the flax districts of Belgium it is stated there are no paupers, as the whole population find employment during the winter,—The first process in the preparation of the fibre is to steep the stalks in water until fermentation takes place. This causes the glue to exude from the heart or the fibrous portion to the woody core, called the boon, to be decomposed, and the
fibres are thus set free. The water most suitable for this purpose is soft river water. The flax is left more free from color by a stream of water flowing over the bundles than if these are steeped, as is often done, in a pool, the water of which is kept to be applied to the soil. This process is called water-rotting or rotting. The result is sometimes obtained by exposing the flax on grass plots to the dew and rain, when the operation is called dew-rotting. This requires much longer time, and also the control of extensive grass fields. It is an excellent method to combine the two processes, commencing with the water-rotting, and when the boon is partially rotted and the gummy matter loosened, to complete the operation upon the grass; the risk of carrying the fermentation too far and injuring the fibre is thus avoided. When the steeping process alone is employed, the flax is removed from the water as soon as the harl is found to separate by the fingers from the boon, and this breaks without bending. At this stage also several stalks knotted together sink in the water. The duration of the process is from 6 to 20 days. The riper the plant, the longer is the time required; hence the necessity of sorting the stalks into bundles of similar qualities. The bundles, being lifted out of the water by hand, are set on end to drain for 24 hours, and the stalks are then spread upon ground, and occasionally turned, to be softened and ripened by exposure for several days. When again gathered and made into sheaves, these may be kept for years in stacks, the quality of the fibre continuing to improve for some seasons. Though the fermenting process is not intended to pass to the putrefying stage, a disagreeable odor is given out from the flax, which even contaminates the air of the district, and the waters are so affected that the fish are poisoned. A more expeditious and agreeable process was therefore highly desirable, and such a one was devised by Mr. R. B. Schenck, of New York, and successfully introduced into the flax districts of Ireland in 1847. This consisted in steeping the stalks in water heated by steam pipes to a temperature of about 90° F. The gummy matter is thus rapidly decomposed, so that in about 60 hours the operation is completed without the escape of any disagreeable odors. The mucilaginous water is then drawn off, and the flax is set to dry upon frames, the waste steam of the engine being used, if necessary, to heat the air for hastening the drying. Other improvements have also been introduced, as that of Mr. Bower of Leeds, which consists in rolling the stalks after they have been steeped in cold or warm water, again steeping, and again rolling. The glutinous matter is thus more thoroughly removed. The addition of a pound of caustic ammonia or of common salt, added to every 10 lbs. of raw water is recommended; and the temperature being kept at from 90° to 120°, the operation may be completed in 80 hours. The most rapid process, however, is to steep the flax for a short time, and then exhaust the air from its fibres by the action of an air pump. Twice steeping and twice exhausting the air serve to remove the glutinous matter in a few hours. Attempts have been made to substitute for the usual mechanical methods of separating the fibre from the boon, but they have not been successful, owing to the inferior quality of the filaments thus prepared. The introduction of chemical matters to hasten the fermentation has been greatly objected to from their liability to weaken the fibres. The reducing of the fibre to the condition of cotton by the process of the chouvlier Clausen has excited strong opposition on this account. He had observed that the flax caught in the branches overhanging a stream in Brazil, which ran through his flax fields, was by repeated wetting and exposure converted into a substance exactly like cotton. He then contrived a way of attaining the same result by exposing the flax to the action of a weak alkaline solution, and afterward removing the alkali by boiling in water to which $\frac{3}{4}$ to $\frac{1}{2}$ of sulphuric acid is added. The straw is next steeped in a strong solution of bicarbonate of soda; and when the fibres are filled with this salt, it is transferred to a solution of sulphuric acid, weak like the former. Carbonic acid gas is generated throughout the substance, and this bursts and splits the fibre in a remarkable manner, giving it the appearance of cotton. Samples of various fabrics of this material, both alone and mixed with cotton, and others with wool, and also with silk, were placed by Clausen in the London exhibition of 1851, and attracted much attention. The same article, however, appears to have been made in England and Germany during the last century, and a factory was established near Vienna in 1780 for its manufacture. Berthollet, Gay-Lussac, and Giobert have experimentally investigated the subject, and Berthollet states that the cotton may be obtained from the commonest refuse tow as from the best flax. For some reason, however, possibly the expense of the process or the inferior quality of the fibre, the operation does not seem to have prospered.—After the flax has been retted and dried, it is submitted to the process called breaking, by which the straws are cracked repeatedly across, the effect of which is to produce the separation of the brittle woody portion, which falls away in pieces from the filaments when afterward beaten by a broad flat blade of wood in the operation of scutching. A variety of machines are used for cracking the boon. The most simple is made with a large wooden blade, called a swinging knife, worked by a handle at one end, and fastened by a pivot at the other into a block with a cleft into which it fits, across this block the flax is laid, a hand moves it to and fro, and moved along, as straw or hay is chopped in a common cutter. Other brakes are worked by the foot—a grooved block being brought down by each impulse upon the flax, which is
FLAX

FLEABANE

held across a fixed block with corresponding grooves; a rude spring jerks the movable block up again as the foot releases it. In the winnowing or stretching the Germans make much use of a thin sabre-shaped wooden knife, with which they strike the flax as a handful of it is held in a horizontal groove in an upright board. The coarse tow and woody particles are thus removed, those which adhere most firmly being scraped or rubbed off by laying the flax upon the leather worn for this purpose upon the leg of the operator. It is estimated that 100 lbs. of dried retted flax should yield 45 to 48 lbs. of broken flax; and from this when the boon waste is further removed by scutching about 24 lbs. of flax are obtained and 9 or 10 lbs. of tow. The breaking of 100 lbs. of straw by the machine described requires the labor of 17 to 18 hours; and the cleaning of 100 lbs. of broken flax by the swining knife takes about 130 hours. Flax is broken also upon a larger scale by machines consisting of fluted rollers, variously contrived; and other labor-saving machines with rotating blades have been applied to the process of scutching. The next process is hatchelling or carding. As performed by hand, a wisp of flax, held in the middle and well spread out, is thrown so as to draw one end of it over a set of sharp steel teeth which are set upright and serve the purpose of a comb. One end of the bundle being hatchelled, it is turned round, and the other is treated in the same way; and the process is repeated on finer hatchels. By this means about 60 per cent. of tow and dust and woody particles are separated from the long fibre, now called line. This is fit for spinning into linen threads, and the tow may be used for the same purpose for coarser fabrics. Machine hatchelling, however, has for the most part taken the place of hand labor, and is conducted upon a large scale and with many modifications in the extensive linen mills. The flax, being cut in lengths of 10 or 12 inches, is arranged in flat layers called stricks, the fibres parallel and ending together. Each of these is held by two strips of wood clamped together across its middle, or sometimes across one end. They are placed around a revolving drum, within which another drum armed with teeth rapidly revolves in a contrary direction, and combs the flax as the ends fall among the teeth. When hatchelled on one side the stick is turned over and the process is repeated on the other. The outer drum revolves slowly, and discharges the stricks when they have been carried over the top of the inner drum, beyond the point where the fibres could no longer fall among the teeth. Much ingenuity is displayed in the modifications of this machinery, and also of a preparatory machine for dividing the fibres into equal lengths and sorting the lower ends, the middles, and the upper ends, each by themselves. The stricks when hatchelled are sorted according to the fineness of the fibres, those made up of the lower ends being the coarsest; but the divisions are much more minute than those of each fibre into three lengths. In making this separation the line sorter, as the operator is called, is guided entirely by the sense of feeling, this indicating the quality of the fibres more delicately than the sight. The next operation preparatory to spinning is to lay the fibres upon a feeding cloth, each successive wisp overlapping half way the one preceding it. The feeding cloth conveys them to rollers, between which they are flattened and held back as a second pair more rapidly revolving seizes the part in advance and draws out the flax. A tape or ribbon of flax is thus formed, which is discharged into a tin cylinder, a row of cylinders standing upon the floor in front of the machines. The tapes or slivers are afterward joined several together, and at the roving frame are slightly twisted, when they are wound upon bobbins, which is the last process before spinning. (See Linen.)—The principal treatise upon this subject is the prize essay of James MacAdam, jr., secretary to the society for the promotion and improvement of the growth of flax in Ireland. The prize was awarded to him by the royal agricultural society of England, and the essay was published in vol. vii. of their "Journal." It has furnished a great part of the data of many of the valuable papers published in the English scientific dictionaries.

FLEABANE, the common name of herbs of the genus _Eryngium_, order _Compositae_, having a
naked receptacle, and a rough pappus, consisting of a single row of capillary bristles with minute ones intermixed, or with a distinct outer pappus of small spines or scales. The solitary or corymbed heads are many-flowered, radiate, flat or hemispherical; disk yellow, rays white or purple; leaves entire or toothed, and generally sessile. Formerly the plants were supposed to have the power when suspended in a room of driving away fleas; hence the name. The daisy fleabanes, _E. annuum_ and _E. Philadelphicum_, are found in various parts of the United States. They have a bitterish taste and a feebly aromatic odor, due to a small amount of volatile oil. Fleabane is diuretic, and has been used in nephritic diseases and dropsy. It is most conveniently given in infusion or decoction. _E. Canadense_, or Canada fleabane, possesses similar properties. It is also called horseweed and butterweed, and is common throughout the country. The volatile oil, of which it contains a larger proportion than the two species first mentioned, is official, and may be used in the dose of from five to ten drops. It has been recommended by some practitioners in the treatment of uterine hemorrhage, but does not possess much control over that difficulty. Occasionally when the stomach is irritable it will be retained while other diuretics are rejected. It may often be added with advantage to other agents similar in effect.

**FLECHIER, Esprit**, a French pulpit orator, born at Pernes, June 10, 1632, died in Montpellier, Feb. 16, 1710. He was educated at Avignon, in the college of the "Fathers of the Christian Doctrine," gave special attention to the culture of eloquence, was noted for the elegance of his language, taught rhetoric at Narbonne, and in 1661 went to Paris, where without fortune or friends he became catechetist in a parish. A Latin poem which he wrote, describing the famous tournament celebrated by Louis XIV. in 1662, was much admired, and he soon after became preacher in the house of Caumartin, a councillor of state, and was admitted into the society of the _hôtel de Rambouillet_. Many of his sermons were highly esteemed, but his funeral oration on the duchess of Montansier in 1672 was his first great triumph. His funeral oration on Turenne, delivered in Paris in 1676, was a masterpiece of art, and placed him, in the opinion of many of his contemporaries, by the side of Bossuet. Among his other funeral orations, those on the first president Lamoignon, on Queen Marie Therese, and on the chancellor Letellier, were most admired. Louis XIV. bestowed upon him first the abbey of St. Severin, then the position of reader to the dauphin, the bishopric of Lavau in 1685, and that of Nimes in 1687. The edict of Nantes having been revoked, he moved to Lyons, then to Paris, before the appointment of Flechier to his last diocese, which contained numerous Protestants, he found great difficulty in the ecclesiastical government of it. His conduct, however, made him equally dear to the Catholics and Protestants of Languedo, who united in mourning his death. Besides his funeral orations, he left _Panegyриques des saints_ (8 vols.), _Vie de Theodoce le Grand_, and _L'Histoire du cardinal Limente_. Flechier's charity and amiability appear especially in his letters. A complete edition of his works was published at Nimes in 1789 (8 vols. 8vo).

**FLECKNOE, Richard**, a British poet, contemporary with Dryden, died about 1678. Little is known of his life, and he is remembered only because his name furnished Dryden the title of his satirical poem against Shadwell, "MacFlecknoe." He is believed to have been an Irish Catholic priest, and wrote several comic plays, among which are "Demenolles à la Mode," "Love's Dominions," "The Marriage of Oceanus and Britannia," and "Ermina, or the Chase Lady." He wrote also a volume of "Epigrams and Enigmatic Characters." His poems are of little value, though some of them have been praised by Southey.

**FLEETWOOD, Charles**, an English republican, son of Sir William Fleetwood, died in 1660. At the commencement of the civil war he enlisted as a trooper in the parliamentary army, and in 1645 was made colonel, and governor of Bristol. In the same year he was returned to parliament for Buckinghamshire, and in 1647 he was one of the commissioners to treat with the king. After the establishment of the commonwealth he became lieutenant general, distinguished himself at the battle of Worcester, and in consequence of his great influence with the army, after the death of his first wife Cromwell gave him his eldest daughter Bridget, the widow of Ireton, in marriage. In 1652 he was appointed commander-in-chief of the forces in Ireland, and afterward lord deputy; but his opposition to the ambitious projects of his father-in-law soon caused his recall. He was appointed one of the fourteen major generals to whom the internal government was committed during the latter days of the protectorate. On the death of the protector he endeavored by his influence with the troops to supplant Richard Cromwell, but in the midst of his intrigues the Stuarts were restored, and he narrowly escaped execution as a rebel. He retired to Stoke-Newington, and passed the rest of his life in obscurity. He was cunning, timid, and irresolute, with but little military skill; and his influence and promotion in Cromwell's army were mainly due to his power in praying and extemporeneous preaching.

**FLEETWOOD, William**, an English prelate and author, born in London in January, 1666, died at Tottenham, Aug. 4, 1723. He graduated at Cambridge, and became chaplain of William III., bishop of St. Asaph in 1707, and bishop of Ely in 1714. He was an eminent pulpit orator, and was in great favor at the court of the king. Among his numerous works are: "Essay on Miracles" (1701); _Chronicum Preciosum_ (1707); and "Free Sermons" (1712), the preface of which was condemned by the house of commons to be burned because it advocated
flemish language and literature. the flanders or dutch, one of the many teutonic dialects, is the vernacular of the flanders (about 2,500,000) in the belgian provinces of east and west flanders, antwerp, and limburg, in north brabant, holland, and in some parts of the french department of le nord, and also scattered in the wallonie (galloromanic) provinces of belgium; French also being spoken in the large cities and used in official documents. it is akin to the flaman and to the hollandish or dutch, which is its younger branch. it is more palatal and nasal than the dutch, which is more guttural. the difference between the Flemish and Dutch languages consists principally in the orthography of words containing in Dutch the double vowels aa, ij or ij, oo, uu, which in Flemish retain the older forms ae, y, oe, ue. all words containing these double vowels are pronounced alike in the two languages, with one partial exception. in west flanders and the department of le nord, France, where the old Flemish is spoken in the greatest purity, the y has the sound of the English short i in pin, instead of that of long i in mine, like its dutch analogue ij; as in mynheer, mijnheer. in the provinces of East flanders, antwerp, and Brabant, however, the y has the long sound. the main difference between Flemish and High German consists in the change of ech (German) into a, and the harsh as into e. so little alteration has taken place in the Flemish language, that many old manuscripts can be easily deciphered at the present day.—The earliest Flemish manuscript, reinaert de vos ("Reynard the Fox"), attributed
to a priest named Willem van Utenhoven (in the 12th century), was for many years consid-
dered of doubtful origin; but at the linguistic congress held at Ghent in 1841 it was con-
ceded and proved beyond a doubt to belong to
Belgium. The next monument of the early litera-
ture is an ordinance of Duke Henry I. of
Brabant (1299). A printed copy of this ordi-
nance, taken from the "Book of Privileges" in
the archives of the city of Brussels, is to be
found in the literary collection of J. F. Willems
(Verhandeling over de Nederduytse Taal en
Letterkunde, 1824). The next work of any im-
portance was Minneloep (Cour d'amour), by
Dirk Potter, 1290. The Rymbeyse ("Bible in
Rimes"), the Spiegel historiæt ("Historical
Mirror") of Jacob Maerient (about 1286),
and the civic laws of Antwerp compiled by J. van
Clere (1300), are the principal works of the
13th century. In the 14th century there were
scarcely any writers of note. The first reli-
gious play, St. Gomaire, written by H. Bal
of Mechlin (1444), several others written by
C. Everhart (1490), and a translation of Boe-
thius by Jacob Velt of Bruges, are the only
literary monuments of the 15th century. In
the 16th we have the Historie van Belgie, by
Marc van Vaernewyck of Ghent (1514), and
the "Hive of the Catholic Church," by Philip
van Marnix (1569). Many French forms of
speech were introduced during the Burgundian
reign, and also many Hollandish during the
way of the Hapsburgs, so that the old Flemish
lost much of its purity and terseness. Hooft,
Vondel, and Cats are the three most promi-
nant names of the 17th century, which embraces
the golden age of Flemish literature (coinciding
with the stadholdership of Frederick Henry
of Orange, 1625-1647). The 18th century fur-
nishes scarcely any work of note, if we except
the "Comparison of the Gothic and Low Dutch
languages," by Ten Kate (Gemeenschap tuschen
de Gotische Spraak en de Nederduytsh, 1710);
Grammaar, a poem by the Jesuit Leévin
de Meyer of Ghent (1720), and the beautiful
poem Rooje ("Little Rose"), by Bellamy
(1772), which has been translated into nearly
all the European languages. At the commence-
ment of the 19th century we have Feith, the
imitator of Goethe and the apostle of the mod-
ern school of Flemish literature (1812); Wil-
lems, on the Flemish and Dutch mode of writ-
ing the language of the Netherlands (Over de
Hollandtish en Vlaamsche Schryflvye en
het Nederduytsh, 1824); and D'halster (1884).
The prize poem on the subject of Belgian in-
dependence was written by Ledeganck, who
was crowned poet laureate at Ghent in 1884.
The most popular writer at the present day is
Hendrik Conscience, born in Antwerp in 1812.
His novels are translated into English, French,
and German. Among the names of those who
have contributed to the diffusion and improve-
ment of the language are Blom-
maert, Van der Voorde, Delecourt, De Laet,
Dedecker, Van Ryswyck, Rens, Van Dywse,
F. Blicke, Serrure, the abbé David, Bormans,
Snellet, and Lebrocqwy. The Belgian gov-
ernment was at first opposed to this move-
ment, or at least looked upon it with coldness;
but latterly it has come to recognize it and give it
countenance. On the occasion of the linguistic
congress at Ghent in 1841, the members of
the government for the first time publicly ad-
dressed the people in the Flemish language.
In 1860 there were 76 political and 31 other
newspapers and periodicals published in Flem-
ish. —see Vandenbosche, Nouvelle grammaire
raisonnée pour apprendre le flamand et le hol-
landais (Lille, 1826); J. Desroches, Grammaire
flamande (Antwerp, 1826); the grammars of
Van Beers and Van Heremans; Noël de Ber-
lemont, Vocabulaire français et flamand (Ant-
werp, 1851); Plantin, Theaurus Teutonicae
Linguae, perfected by C. Kiliian (Antwerp,
1758); Corleva, Trésor de la langue flamande
(Commerdam, 1741); Halma, Grand diction-
naire français et flamand (Leiden, 1778);
Desroches, Nouveau dictionnaire français-
flamand et flamand-françois (Ghent, 1808);
Olinger, Nouveau dictionnaire français-fla-
mand (Mechlin, 1814). On modern Flemish
literature see Ida von Düringsfeld, Von der
Schelde bis zur Maas (3 vols., Leipsic, 1861).

FLEMING, Paul, a German poet, born at
Hartenstein in October, 1609, died in Hamburg,
April 2, 1640. He was the son of a clergy-
man. His medical studies in Leipsic being in-
terrupted by the thirty years' war, he accom-
panied the envoy of Duke Frederick of Got-
torp-Holstein to Russia and Persia, married
the daughter of an Estonian merchant, and
shortly before his death received his medical
diploma at Leyden. He belonged to the Silesian
school of lyrical poets, and in some respects
excelled even Opitz. His Geistliche und
seelische Poemata (Jena, 1642) and his eloquent
hymn In allen meinen Thaten rank among his
finest productions. Selected editions of his
works have been published in Stuttgart (1820)
and in Muller's collection of German poets of
the 17th century (Leipsic, 1822). His posthu-
ous Latin poems and his pastoral entitled
Marginis were published by Leppenberg in
Stuttgart in 1868.

FLENSBURG, or Flensburg, a seaport and mar-
et town of the Prussian province of Schleswig-
Holstein, at the head of Flensburg fjord, an
inlet of the Baltic, 20 m. N. W. of Schles-
wig; pop. in 1871, 21,325. It is the most
populous town and the chief commercial mart
of the former duchy of Schleswig. It manufac-
tures sugar, tobacco, paper, soap, and iron,
has breweries and distilleries, and builds ships
for the West India trade. Railways connect it
with the principal towns of the province,
and with Kolding in Jutland, and steamships
with Stettin and other ports of the Baltic.
The harbor is by far the largest in Germany,
but is difficult of entrance. About 200 vessels,
many of which are employed in the Greenland
whale fishery, are owned here. The number
of entrances in 1669 was 2,211. Flensburg was a wealthy town as early as the 12th century, but it afterward suffered much from wars and catastrophes.

FLETCHER, Andrew (commonly called Fletcher of Saltoun), a Scottish author, born in Saltoun, East Lothian, in 1653, died in London in 1716. He was educated under the care of Gilbert Burnet, then minister of the parish of Saltoun, and spent several years in travel on the continent. In 1681 he obtained a seat in the Scottish parliament for his native county, and distinguished himself by his inflexible opposition to the tyrannical tendencies of the English government. He soon found it necessary to withdraw to Holland, was then summoned before the privy council at Edinburgh, and failing to appear was outlawed, and his estate confiscated. He accompanied the expedition of the duke of Monmouth to England in 1685, but immediately went abroad again in consequence of shooting the mayor of Lyme-Regis in a scuffle. In Spain, on the application of the British ambassador, he was imprisoned, but escaped by the aid of an unknown friend; and in Hungary he gained distinction as a volunteer in the army against the Turks. At the Hague he was prominent in forwarding the scheme of the revolution of 1688, which restored him to his country. He soon recovered his estate and resumed his seat in the Scottish parliament, but became as vehement an opponent of the government of William as he had been of that of his two predecessors. He exerted himself to the last against the union of the two kingdoms, and because the 13 "limitations" which he proposed failed to be adopted he retired from public life. He possessed fine scholarly accomplishments, and his writings sometimes display a high degree of literary excellence. The principal of them are: a "Discourse of Government with Relation to Mili-
tias" (Edinburgh, 1698); two "Discourses concerning the Affairs of Scotland" (Edin-
burgh, 1698): Discorso delle cose di Spagna (Naples, 1699); "Speeches," &c. (Edinburgh, 1703); and an "Account of a Conversation concerning a Right Regulation of Governments for the Common Good of Mankind" (Edin-
burgh, 1704). His collected writings were published at London in 1 vol. 8vo in 1727, and an essay on his life and writings, by the earl of Buchan, appeared in 1797.

FLETCHER, I. Giles, an English poet, cousin of Fletcher the dramatist, born about 1580, died at Alderton, Suffolk, in 1628. He was educated at Trinity college, Cambridge, and became rector of Alderton, where his life passed with little variety of incident. The single poem which he left, entitled "Christ's Victory Triumphing," lost in 1609, has peculiar and original beauties, with many of Spenser's characteristics.

II. Phileas, a poet and clergyman, brother of the preceding, born about 1584, died at Hilgay, Norfolk, about 1650. After being educated at Eton and Cambridge, he was presented in 1621 to the living of Hilg-

FLEURUS, a town of Hainaut, Belgium, near the left bank of the Sambre, 7 m. N. E. of Charleroi; pop. in 1869, 4,098. It has been the scene of four great battles. The first took place Aug. 29, 1622, between the Spaniards under Gonzales of Cordova and the army of the Protestant union under Christian of Bruns-
wick and Count Mansfeld, the victory being
claimed by both sides; the second, July 1, 1690, between the French under Marshal Luxembourg and the Germans under the prince of Waldeck, the latter being defeated; the third, June 26, 1794, when the republican French general Jourdan defeated the imperialists under the prince of Coburg; and the fourth, generally known as the battle of Ligny, in which Blücher was worsted by Napoleon, June 16, 1815.

FLEURY, André Hercule, cardinal d., a French prelate and statesman, born in Lodève, June 22, 1653, died in Paris, Jan. 29, 1748. He was educated at a Jesuit college in Paris, and was appointed almoner to the queen Marie Thérèse, then to Louis XIV., who unwillingly promoted him to the bishopric of Fréjus in 1698, at the request of the archbishop of Paris. On the king’s death the regent appointed him preceptor to Louis XIV., then about five years old. On the death of the regent in 1723 he advised the young king to take the duke de Bourbon as first minister, reserving for himself a seat in the privy council, and the dispensation of ecclesiastical prerogatives. In 1726 he caused the duke de Bourbon to be dismissed, and, notwithstanding he was himself in his 73rd year, assumed supreme power, with the title of minister of state and superintendent of the general post office. In the same year he was created a cardinal. Under his administration France was generally at peace, the disorders of the past reign disappeared, reforms were made in the government, arts and sciences were fostered, and the country enjoyed comparative prosperity at home. But abroad she lost her high place in the councils of Europe, her army degenerated, her navy decayed, and toward the close of his life the cardinal was charged with involving France in the war of the Austrian succession, which had been begun against his wishes, and up to the time of his death had been little more than a series of disasters for his country. He sought to introduce into the public administration the frugality practised in his own household; and with all his opportunities for emolument, he died poor.

FLEURY, Claude, abbé, a French ecclesiastical writer, born in Paris, Dec. 6, 1840, died July 14, 1723. For nine years he followed the legal profession, giving much attention to literary and historical pursuits. In 1673, having received orders, he became preceptor to the sons of the prince de Conti. In 1674 he published L’Histoire du droit français; in 1678, a Latin translation of Bossuet’s Exposition de la foi catholique; from 1681 to 1683, Les mœurs des Israélites, Les mœurs des Chrétiens, and Le grand catechisme historique, three excellent little books which he had prepared for the use of his pupils; and in 1687, L’Institution du droit ecclésiastique. In 1685 he accompanied Fénelon to Saintonge, and in 1689 Fénelon procured his appointment as his assistant in the education of the dauphin’s son. In this employment he remained 16 years, during which he was also engaged on his Histoire ecclésiastique, the first volume of which appeared in 1691. He spent 30 years in bringing this work down to the beginning of the 16th century. It ranks among the most candid histories of Christianity.

FLICKER. See Woodpecker.

FLEIDNER, Theodor, a German clergyman and philanthropist, born at Eppstein, Rhenish Prussia, Jan. 21, 1800, died at Kaiserswerth, Oct. 4, 1864. In 1828 he became pastor of the congregation at Kaiserswerth, to which his father had ministered until his death in 1818. Soon after his settlement his parishioners were suddenly impoverished by the failure of a manufacturing firm which had employed most of them. Refusing to take another church, he set himself the task of relieving his people, and visited the philanthropic institutions of other countries, particularly those of England. On his return he founded at Kaiserswerth an institution for the relief of the sick, the poor, and the fallen. In 1826 he founded a German society for the improvement of prison discipline, and in 1833 an asylum for discharged female convicts. This asylum at first consisted only of a summer house in his garden, which soon proved too small, and was exchanged for a more substantial edifice. His next idea was to re-establish the ministry of women in the Protestant church, and in 1866 he inaugurated the institution of deaconesses which is still flourishing at Kaiserswerth. “We had no money wherewith to buy the house,” writes Fleidner; “my wife had been confined only three days before; but nevertheless she laid it upon me, in the name of the Lord, to buy the house, and the sooner the better. I bought it cheerfully on the 20th of April, 1866. The money was to be paid before Martinmas of the same year.” The money was paid before that time, although the price was more than $1,600—a large sum for that country and class. Two friends, single women, who offered themselves for nursing in the hospital, were the first Kaiserswerth deaconesses. In 1838 Fleidner first sent out deaconesses to work in other places. In 1849 he visited the United States, and established a “mother house” at Pittsburgh, Pa. (See Deaconess.) He also established at Kaiserswerth a lunatic asylum, a boys’ school, and training colleges for schoolmasters and schoolmistresses, training his deaconesses as teachers in all of them. He himself frequently taught them, and is said to have been fond of striking and often laughable illustrations, such as falling on the floor when telling the story of Goliath, or suddenly sending a boy under the table to represent the fall of a traveller over a precipice. De Ließda says that when he visited the Kaiserswerth establishment in 1864 it took him three hours to walk over the premises and peep into the principal apartments. From 1836 Fleidner published a monthly called Der Armen- und Krankenfreund, and was the author of Buch der Mârtýrers und anderer Glaubens- zeugen der evangelischen Kirche von den

FLINDERS, Matthew, an English navigator, born at Donington, Lincolnshire, about 1760, died July 19, 1814. In 1795 he was midshipman on board the vessel which conveyed Capt. Hunter, the governor of Botany Bay, to Australia. At Port Jackson he embarked with the surgeon of the ship, George A. Bass, in a boat 8 ft. long, in which they explored the estuary of George’s river. Their discoveries determined them to explore the whole Australian coast. In a large decked boat with six men, sailing S. through a passage afterward named Bass strait, they first discovered that Tasmania was a separate island. In July, 1801, Flinders, now a captain, again sailed from England, surveyed the whole Australian coast as far as the eastern extremity of Bass strait, then refitted at Port Jackson, and in the summer of 1802, steering N., explored Northumberland and Cumberland islands, and surveyed the Great Barrier reef of coral rocks. He then returned to Port Jackson, where his vessel was condemned, and, unable to procure another, he embarked as a passenger on a store ship to lay his charts and journals before the admiralty, and to obtain another ship to continue his examination of Australia. On the way to England the store ship and a consort were wrecked on a coral reef. Flinders and two or three companions went in an open boat 750 m. to Port Jackson, where he secured a schooner of 29 tons, in which, accompanied by another schooner, he returned and rescued the wrecked crews. He now determined to go to England in the small schooner; but on his way, having made the Isle of France, he was seized by the governor, in spite of a French passport, and was detained for six years; after which his health was so impaired, and his spirit so broken, that he expired in London on the day when his narrative was published (“Voyage to Terra Australis, &c., in the Years 1801, 1802, and 1803,” 2 vols. 4to, London, 1814).

FLINT, a peculiar amorphous variety of nearly pure quartz, found in chalk, in nodular masses or in layers, sometimes forming beds of such extent as to be used for building, as in the counties of Kent, Suffolk, and Norfolk, England. It is usually of a dark color from the presence of carbonaceous matter, supposed to be derived from animal remains; but some specimens are almost white and transparent. It breaks with a smooth conchoidal fracture, and very sharp edges may be formed upon it with a hammer; a quality which adapts it for being made into gun flints and arrow and spear heads. Its specific gravity is 2.59. Berzelius found in a specimen 0.117 per cent. of potash, 0.144 lime, 0.035 magnesia, 0.38 alumina, and 0.72 carbonaceous matter. According to Fuchs, the silice is partly soluble. It was formerly thought essential in the production of flint glass, but is now superseded by pure granular quartz or sand. It is still used in the manufacture of porcelain. Flint nodules constitute a peculiar feature in the chalk cliffs of the coast of England. They occur in horizontal layers scattered through the upper portion of the chalk formation, and in a few instances have been seen in vertical rows like pillars, at irregular distances, the nodules not being in contact either in the horizontal or vertical arrangement. They commonly contain a nucleus of parts of marine fossils, such as are abundant in the chalk, as shells, sponges, echinata, &c.; and they also present the forms of hollow geodes, their cavities lined with quartz crystals, iron pyrites, carbon of iron, chalcedony, &c. —Flint is a common mineral production in the United States, but it is converted to no use. It abounds in the tertiary formations of the southern states, and is met with in the older rocks, even to the metamorphic quartz associated with the lowest stratified rocks. On the Lehigh mountain in Pennsylvania, at Leiber’s Gap, is exposed in loose fragments in the soil a vast amount of flint rock, associated with cherty quartz incrusted with chaledony and mammillary and botryoidal crystallizations. In the woods west of the road 20 acres have been dug over by the Indians, to obtain the flint for arrow and spear heads. Piles of broken flint still lie uncovered by the sides of the excavations. The stone was highly prized by the Indians, and they worked it skilfully.
ufactures are mill and steam machinery, agricultural implements, carriages, cabinet ware, and woollens; 77,360 yards of cloths, cassimere, and flannels were produced in 1872. There are two national banks and a savings bank. The Flint scientific institute has a valuable library and a cabinet embracing several thousand specimens of natural history. The ladies' library association has about 2,000 volumes. Three weekly newspapers are published. In 1872 there were 20 public schools, with 25 teachers and an average attendance of 1,086 pupils. There are eight churches. The first log cabin on the site of Flint was built in 1819, but the actual settlement dates only from 1830. The city was incorporated in 1855, and in 1871 it was enlarged by annexation, so that in 1873 the population was about 9,000.

FLINT. I. Austin, an American physician, born in Petersham, Mass., Oct. 20, 1812. He was educated at Amherst and Harvard colleges, and graduated M. D. at Harvard in 1833. After practising successfully in Boston and Northampton, he removed in 1836 to Buffalo; in 1844 was appointed professor of the institutes and practice of medicine in the Rush medical college at Chicago; resigned after one year, and in 1846 established the "Buffalo Medical Journal," which he edited for ten years. In connection with Professors White and Hamilton he founded in 1847 the Buffalo medical college, in which he was for six years professor of the principles and practice of medicine and of clinical medicine. From 1852 to 1856 he filled the chair of the theory and practice of medicine in the university of Louisville, Ky., and then accepted a professorship of pathology and clinical medicine in Buffalo. His essays "On the Variations of Pitch in Percussion and Respiratory Sounds," and "On the Clinical Study of the Heart Sounds in Health and Disease," received the first prizes of the American medical association in 1852 and 1859. A translation of the former of these and of his clinical reports appeared in Paris in 1854. From 1858 to 1861 he spent the winters in New Orleans as professor of clinical medicine in the school of medicine and visiting physician to the Charity hospital. In 1859 he removed to New York, where two years later he was appointed visiting physician to the Bellevue hospital, professor of the principles and practice of medicine in the Bellevue hospital medical college, and of pathology and practical medicine in the Long Island college hospital. He has published "Clinical Reports on Contiguous Fever" (Buffalo, 1852); "Clinical Reports on Chronic Pleurisy" (1853); "Clinical Report on Dysesthesia" (1853); "Physical Exploration and Diagnosis of Diseases affecting the Respiratory Organs" (1856); 2d ed., 1860; "Practical Treatise on the Pathology, Diagnosis, and Treatment of Diseases of the Heart" (1859); 2d ed., 1870; and a "Treatise on the Principles and Practice of Medicine" (1866). This work has been highly successful, and has passed through four editions, the last of which appeared in 1873. In 1872 Dr. Flint was elected president of the New York academy of medicine. H. Austin, Jr., an American physician, son of the preceding, born in Northampton, Mass., March 28, 1836. He attended medical lectures in 1854-56 at the university of Louisville, Ky., and afterward at the Jefferson medical college in Philadelphia, where he took his degree in 1857. For the next two years he resided in Buffalo, where he became editor of the "Buffalo Medical Journal," and was appointed attending surgeon to the Buffalo city hospital, and professor of physiology and microscopical anatomy in the medical department of the university of Buffalo, delivering one course of lectures in 1858-59. He then removed with his father to the city of New York, and was almost immediately appointed professor of physiology in the New York medical college. In 1860 he accepted the chair of physiology in the New Orleans school of medicine. The following spring he visited Europe for professional study, following the courses and receiving the special instruction of Robin and Claude Bernard. In 1861, on the organization of the Bellevue hospital medical college in New York, he was appointed professor of physiology and microscopical anatomy in that institution, which position he still holds (1874). He was also for several years professor of physiology in the Long Island college hospital at Brooklyn. Besides attaining an extensive and thorough acquaintance with the literature of physiology, he has made many original experiments and observations, and has largely contributed to the advancement of the science by important articles in the medical journals and by separate publications. His article on "A New Excretory Function of the Liver," in the "American Journal of the Medical Sciences" for October, 1862, received in 1869 an honorable mention and a recompense of 1,600 francs from the committee of the French academy of sciences on the Mouton prize of medicine and surgery. His most important work is "The Physiology of Man," to be completed in five volumes, of which four have appeared, viz.: vol. i., on "The Blood, Circulation, and Respiration" (New York, 1866); vol. ii., "Alimentation, Digestion, Absorption, Lymph, and Chyle" (1867); vol. iii., "Secretion, Excretion, Ductless Glands, Nutrition, Animal Heat, Movements, Voice, and Speech" (1870); vol. iv., "On the Nervous System" (1872). He has also published a "Manual of Chemical Examination of the Urine in Disease" (1870).

FLINT, Timothy, an American clergyman and author, born in North Reading, Mass., July 11, 1780; died in Salem, Aug. 18, 1850. He graduated at Harvard college in 1800, entered the ministry of the Congregational church, and settled at Lunenburg, Mass., in 1802. He was a diligent student of the natural sciences, and his chemical experiments led some ignorant per-
sons to charge him with counterfeiting coin. He prosecuted them for slander; an ill feeling increased by political differences sprang up between him and his parishioners, and he resigned his charge in 1814. He then preached in various parts of New England, and in September, 1815, set out for the west as a missionary, and passed seven or eight years in the Ohio and Mississippi valleys. In 1825 he returned to Massachusetts, broken in health, which was of climate soon restored.

His first work was "Recollections of Ten Years passed in the Valley of the Mississippi" (8vo, Boston, 1826), which was reprinted in London, and translated into French. In the same year he brought out a novel, "The Spanish Shorter, or the Mexican Patriot." His next publication was a "Condensed Geography and History of the Western States in the Mississippi Valley" (2 vols. 8vo, Cincinnati, 1828), forming with the "Recollections" one of the best accounts of that region ever written. In 1828 he removed to Cincinnati, where he edited for three years the "Western Review." In 1833 he went to New York and conducted a few numbers of the "New York Magazine." He afterward took up his residence in Alexandria, Va., spending most of his summers in New England.

His writings are spirited and powerful, but somewhat wanting in polish. His principal works, besides those mentioned above, are: "Arthur Clennam," a novel (2 vols. 12mo, Philadelphia, 1832); "George Mason, or the Backwoodman" (2 vols. 12mo, Cincinnati, 1830); a translation of Droz, "Essay upon the Art of Being Happy" (Boston, 1832); "Indian Wars in the West" (12mo, 1833); "Lectures on Natural History, Geology, Chemistry, and the Arts" (12mo, Boston, 1833); and "Memoir of Daniel Boone" (12mo, Cincinnati, 1834).

PIECE. (Indian name, Trenataemaka), a river of Georgia, rising in the N.W. part of the state, near Fayetteville, flowing S., and uniting with the Chattahoochee at the S.W. extremity of the state, to form the Appalachioca. It is about 300 m. long, and is navigable to Albany, 230 m. from the Gulf of Mexico.

FLINTSHIRE, a N.E. county of Wales, consisting of two separate portions, lying at a distance of 8 m. from each other, with a part of Denbighshire between them, the larger portion bordering on the Irish sea and the estuary of the Dee; aggregate area, 289 sq. m.; pop. in 1871, 76,245.

It is the smallest, but in proportion to its extent, most populous county in Wales. The surface near the coast is low, and elsewhere is diversified, though there are no great elevations. A range of hills runs along the S.W. border, and is followed by Eventually, the county traverses the county in a N.E. direction. Between these ridges are fertile valleys, including the well known vale of Clwyd, watered by several rivers, which flow on the one side into the

Clwyd and Alyn, and on the other into the Dee, which forms the N.E. boundary. The greater part of the county rests upon the coal measures, which exist chiefly on the coast of the estuary of the Dee. In 1887 there were 40 collieries and 45 lead mines in the county. The principal smelting works are at Mold and Holywell. The other minerals are copper, iron, zinc, and calamine. Agriculture employs about 8 per cent. of the population. Wheat and rye are principally cultivated, and considerable quantities of butter and cheese are made.

The shipping trade is not extensive, as the ports are accessible only to small craft. The Chester and Holyhead railway traverses the county, and the Chester and Mold railway penetrates to its centre. The chief towns are Mold, the capital, Flint, St. Asaph, Holywell, Rhuddlan, Hawarden, and Bagilot.

FLOATING ISLANDS. An early notice of this phenomenon is recorded in an interesting letter of the younger Pliny to Gallus, in which he describes the appearance of a number of floating islands in the Lacus Vadinonis, now Lago Monti di Bassano, near Rome. They were covered with reeds and rushes, and the sheep grazing upon the borders of the lake passed upon them, and were often floated away from the shore. On a lake near Gerdaun, in East Prussia, the extent of such islands is said to be sufficient for the pasturage of 100 head of cattle; and on one in Lake Kohn, near Osnabruck, are many fine elm. These islands are produced by accumulations of drift wood, among which drifting sands and earth collect and form a soil, in which plants take root and flourish. The great "rafts" of some of the western rivers are of this nature; for the most part these do not float from place to place, but masses are occasionally detached and drift out from the mouth of the Mississippi, carrying the birds, serpents, and alligators that had taken refuge upon them. Such islands have been seen floating 100 miles off from the mouth of the Ganges, from which they had been discharged. On the great rivers of South America they are very often met with, carrying the prolific productions of the vegetable and animal life of the tropics, and depositing them in new localities. Thus they may have been the means of distributing species of the larger animals among the islands of the south Pacific, upon many of which their introduction by any other mode is difficult to account for. Prescott describes the floating gardens or chinampas of Mexico as an archipelago of wandering islands. The primitive Aztecs adopted the plan suggested by these natural objects, and covered rafts of woven reeds and rushes with the fertile sediment drawn up from the lake. Upon these gardens, gradually extending to 200 or 300 feet in length, the inhabitants grew flowers and vegetables for the market of Tenochtitlan. Some of the chinampas were firm enough to sustain small trees and a hut, and could be moved about with a pole or fastened to it at
the will of the owner. Remarkable floating islands occur in the Malay archipelago.

FLODDEN FIELD. Battle of, fought Sept. 9, 1513, between the Scots under King James IV. and the English under the earl of Surrey. Henry VIII. was on the continent engaged in his expedition against France when the border feuds broke into open war. James crossed the Tweed, Aug. 32, at the head of the feudal array of his kingdom, captured four border fortresses, and encamped, Sept. 9, on Flodden, the last of the Cheviot hills, in Northumberland, 8 m. S. E. of Coldstream. The earl of Surrey, to whom was intrusted the defence of the English border, summoned the gentlemen of the northern counties to join him at Newcastle, and reached Alnwick Sept. 8, with 26,000 men, where he offered battle to James in a message sent by a pursuivant-at-arms. By a skilful counter-march he placed himself on the morning of Sept. 9 between James and Scotland. The battle began between 4 and 8 o'clock P. M., and was decided in little more than an hour. The Scottish army, setting fire to its tents, descended the ridge of Flodden to secure the eminence of Blankystone, and was met by the English army, which advanced in four divisions under the command of Surrey, his two sons, Thomas and Sir Edmund Howard, and Sir Edward Stanley. Earls Huntley and Home, who led the Scottish left wing, charged the Howards so successfully with a body of spearmen that Sir Edmund was unhorsed and his division put to flight. The battle was restored in this quarter by the advance of Lord Dacre with the reserve of cavalry. On the right wing the highlanders were unable to stand against the severe execution of the Lancashire archers. James, surrounded by some thousands of chosen warriors, charged upon Surrey in the centre of his army with such resolution as to penetrate within a few yards of the royal standard, when he was attacked in the flank and rear by Stanley, already victorious over the Scottish right. James fell by an unknown hand within a lance's length of Surrey, and all of his division perished with their king, not one of them being made prisoner. Before dawn the Scots abandoned the field in disorder. Their loss was about 10,000 men, which included the prime of their nobility, gentry, and even clergy. "Scarcely a family of eminence," says Scott, "but had an ancestor killed at Flodden, and there is no province of Scotland, even at this day, where the battle is mentioned without a sensation of terror and sorrow." The English lost about 7,000 men. Scott's "Marmion, a Tale of Flodden Field," contains in the last canto an accurate and most animated description of the battle.

FLOOY, Henry, an Irish orator and politician, born in 1732, died Dec. 2, 1791. He was a son of the chief justice of the court of king's bench in Ireland, and was educated at Trinity college, Dublin, and at Oxford. In 1759 he became a member of the Irish house of commons, where his eloquence made a remarkable impression, and his activity in support of all measures beneficial to his country won him great popularity. His relations to the government, however, exposed him to the charge of inconsistency. He was not elected to parliament in 1761, and was made a privy councillor for the two kingdoms, and vice treasurer of Ireland in 1775, but resigned in 1781. In 1788 he held a celebrated discussion with Mr. Grattan in the house of commons. In the same year he was returned to the English parliament for the city of Winchester, and in 1785 he represented Seaford. His speeches were logical, pure in style, and rich in figures and classical allusions. He left a Pindaric "Ode to Fame," and a poem on the death of Frederick, prince of Wales, to be found in the Oxford collection, and published a volume of speeches in 1787. His "Life and Correspondence," by W. Flood, was published in London in 1838.

FLORENCE (Ital. Firenze). I. A province of central Italy, included in Tuscany, bordering on Modena, Bologna, Ravenna, Forlì, Pesaro ed Urbino, Arezzo, Sienna, Pisa, and Lucca; area, 2,293 sq. m.; pop. in 1872, 766,928. It comprises the four districts of Florence, Pistoja, Rocca San Casciano, and San Miniato. The principal chain of the central Apennines traverses the E. part of the province. Other detached mountains extend into the E. and S. parts. The remainder is partly hilly and partly level. The principal river is the Arno, which receives a considerable number of affluent streams. Agriculture is flourishing in the numerous valleys, and the industries of the city of Florence is the best of Tuscany. Other branches of industry are cattle breeding, the cultivation of the olive, fishing, and mining.

II. A city, capital of the province and formerly of the grand duchy of Tuscany, in lat. 48° 46' 56" N., lon. 11° 15' 80" E., 194 m. S. E. of Turin, 140 m. N. N. W. of Rome, and 250 m. N. N. W. of Naples; pop. in 1872, 167,058. Of late the area of the city has been considerably increased by the extension of the suburbs, and while Florence was the capital of Italy (1865-'71) the population is believed to have considerably exceeded 200,000; but since the transfer of the seat of government to Rome it has rapidly decreased. The city lies in a beautiful, well wooded, well cultivated valley, surrounded by the Apennines. It was encircled by an old wall 5 or 6 m. long, with 8 gates, but the wall was demolished in 1873. The river Arno flows through it, the larger part of the city being on the right or N. bank. The river within the city is crossed by four fine stone bridges, of which the most noted is the Ponte di Santa Trinità, built in 1666-'70. It is adorned with statues, is 828 ft. long, and the central arch
has a span of 96 ft. This bridge is a favorite evening walk of the people. The Ponte Vecchio is 75 ft. wide, and the carriageway in the middle is lined on each side by a row of shops, occupied chiefly by goldsmiths and jewellers. There are also two suspension bridges. In the older parts of the city the streets are narrow and irregular, and the houses for the most part meanly built; but the newer and larger portions are very handsome and stately, and the streets wider than is common in the cities of southern Europe, and solidly paved with blocks of stone. The churches of Florence are 173 in number, and many of them of great size and antiquity; but few are completely finished, and their general appearance is neither elegant nor picturesque. The Duomo, or cathedral church of Santa Maria del Fiore, is a vast and superb structure, which is surpassed in architectural grandeur only by St. Peter’s at Rome. The decree for its erection was issued in 1294, and its foundations were laid in 1298; the great dome was erected by Brunelleschi in the 15th century, but the façade was not completed till the middle of the 17th. The length of the building is nearly 600 ft., and of the united transepts 806 ft.; its height from the pavement to the summit of the cross is 887 ft.; the height of the nave is 153 ft., and of the side aisles 96½ ft., and the width of the nave and aisles is 128 ft. The exterior of the church is covered throughout with red, white, and black marble, disposed in panels and variegated figures; and the pavement is also of many-colored marble, much of which was laid under the direction of Michel Angelo. The dome of this cathedral is the largest in the world, its circumference being greater than that of the dome of St. Peter’s, and its comparative height greater, though its base is not placed so high above the ground. It excited the admiration of Michel Angelo, to whom it served as a model for the dome of St. Peter’s. This church is richly adorned with statues and pictures, most of which are by eminent masters. Among the statues is an unfinished group by Michel Angelo, representing the entombment of Christ. Among the paintings is a portrait of Dante, executed in 1465. Near the cathedral stands the campanile or belfry, which was designed by Giotto, and begun in 1296. It is a square tower, 276 ft. high, light and elegant, in the Italian-Gothic style, and divided into four lofty stories. Charles V. used to say that it deserved to be kept in a glass case. The lower story contains two ranges of tablets, designed by Giotto and executed by him and by Andrea Pisano and Luca della Robbia. Opposite the principal front of the cathedral stands the baptistery, whose three great bronze portals, adorned with bass reliefs by Andrea Pisano and Ghiberti, were declared by Michel Angelo worthy to be the gates of Paradise. The church of San Lorenzo has attached to it a sacristy which contains seven statues by Michel Angelo. Adjoining the same church is the costly Medici chapel, begun in 1604 by Ferdinand I., grand duke of Tuscany, as the mausoleum of his family, on which, it is said, $17,000,000 have been expended. It is an octagon 94 ft. in diameter and 200 ft. high, and is lined throughout with lapis lazuli, jasper, onyx, and other precious stones. The church of Santa Croce, 480 ft. long and 134 ft. wide, whose foundation stone was laid in 1294, is the Pantheon or Westminster abbey of Florence. It contains the
tombs of Michel Angelo, Machiavelli, Galileo, Leonardo Aretino, Guicciardini, Alferi, Ugo Foscolo (since June 24, 1871), and of many other illustrious men. Florence abounds in palaces of a singularly solid, heavy style of architecture, resembling prisons or fortresses. They were built in ages of turbulence and civil strife, for defence and security rather than for display or luxury. Their great size and height, the rough massiveness of their lower stories, and the huge cornices crowning over their fronts, give them a very impressive appearance. The two principal palaces, the Palazzo Vecchio and the Palazzo Pitti, contain celebrated collections of works of art. The gallery in the Palazzo Vecchio exhibits portraits of many celebrated Florentines, from Cosmo il Vecchio (died 1464) to Cosmo the first grand duke (died 1574). The Pitti gallery, which is very rich and extensive, contains many of the best works of Michel Angelo, Titian, Salvador Rosa, Andrea del Sarto, Murillo, Rubens, and several of Raphael's, including the celebrated "Madonna delle Sgigola." The gallery in the Uffizi is considered one of the choicest and most varied in Europe. It displays in the picture halls a historical series of the Tuscan and Venetian schools, arranged chronologically, and exhibiting the finest specimens of the Italian masters. The French, German, Dutch, and Flemish schools are also richly represented. Among the statues in the room called the tribune are the famous Venus de' Medici, the Apollo, the "Dancing Faun," the "Wrestlers," and the "Knife Grinder." The finest paintings of the entire collection are hung in the tribune. In another hall is a series of portraits of eminent painters, chiefly executed by themselves. The gallery has also a series of busts of the Roman emperors from Caesar to Constantine, which is unsurpassed except in the Capitoline museum in Rome; and there are halls devoted to sculptures of the 16th and 17th centuries, original drawings of the old masters, engravings, ancient bronzes, medals, gems, cameos, and intaglios, the whole forming one of the finest collections in the world. The library is rich in autographs, letters, and portions of the works of Boccaccio, Poliziano, Machiavelli, Michel Angelo, Tasso, Alferi, Monti, and others. The Uffizi is connected with the Pitti palace by a passage which crosses the Ponte Vecchio. This is lined with tapestries, paintings, drawings, and engravings, and in the middle of these was once a bathing room connecting with the waters of the Arno. Besides these famous collections, the city abounds in galleries, museums, and choice works of art. The national library, formed in 1864 by the union of the Magliabechian and the Palatine, contains over 200,000 printed volumes and 14,000 MSS.; the Marucellian 60,000, and the Riccardian 380,000; and the Biblioteca 19,000 MSS. Of the university, which was opened in 1438, nothing but the theological library is now left. There are many literary institutions, the chief of which was formerly the academy della Crusca, founded in 1582, whose object was the improvement of the Italian language. It is now incorporated with two still older societies in what is known as the royal Florentine academy. There are agricultural and fine-art academies, a medical college, an academy of fine arts for ladies, an athenaeum, an Egyptian-Etruscan museum of antiquities, a museum of Italian art and manufactures, and 10 theatres. The Boboli gardens, named from a family which once had a house in the vicinity, are divided into endless walks, shady pathways, waters crowned with elaborately sculptured fountains and filled with gold fish, and groves adorned with statues, among which are a Neptune executed in 1565 by Stoldo Lorenzi, Pegasus by Costoli, four large unassembled statues by Michel Angelo which he intended as a part of his monument to Pope Julius II., Apollo and Ceres by Baccio Bandinelli, Paris and Helen by Rossi da Fiesole, and four satyrs and a Venus by Giovanni da Bologna. The academy contains some of the finest examples of early Florentine art, illustrating the lives of the Saviour, the Virgin, saints, martyrs, and apostles, Fra Angelico's "Last Judgment," with many choice works of Bartolommeo, Raphael, Andrea del Sarto, and other masters. The Egyptian-Etruscan museum was a convent in the 16th century, and is adorned with frescoes from the penile of Raphael. For many years it was devoted to secular uses; and in 1826, while the proprietor, a coach builder, was preparing to whitewash the walls of the former refectory, was discovered beneath dirt and coats of whitening the fine fresco of the "Last Supper," in which the border of the dress of St. Thomas bears the autograph of Raphael with the date M.D.V. To this building quite recently have been transferred the Etruscan remains formerly in the Uffizi gallery. This is a most valuable collection of papyri, basi1 rilievi, statues, vases, sarcophagi, bronzes, jewelry, pottery, and other relics of great antiquity. The museum of natural history was opened in 1780. Napoleon's sister, Elisa Bacchiocchi, grand duchess of Tuscany, added a school of public instruction. In 1869 Victor Emmanuel founded a school for more advanced studies. The museum is very rich in paleontological, zoological, geological, and mineralogical collections, and is celebrated for its wax preparations exhibiting a complete series of perfect specimens of human and animal anatomy. It contains also a valuable collection of physical and astronomical instruments, among them the telescopes constructed by Galileo. Attached to the building, and adjoining the Boboli gardens, are the botanical gardens, remarkable for rare plants, and for the great number of species, which have increased from 820 in 1543 to 4,000 in 1870. A new observatory was opened in 1871 under Donati's direction. The charitable institutions are numerous, including asylums for the blind,
for the deaf and dumb, and for orphans, and an ancient association of the nobles and gentry for the relief of the sick and suffering poor. — The trade of Florence is chiefly in the produce of the surrounding country, oil, wine, and raw silk, and in her own manufactures, of which the principal are silk stuffs, straw hats, artificial flowers, musical and scientific instruments, jewelry, and fine porcelain. The climate is mild and healthy, though the winds from the Apennines cause sudden transitions from heat to cold, frequently in the same day. The city is exempt from specific diseases and epidemics. Foreigners find September, October, and November the most agreeable months for residence, and the spring months are very delightful. The environs are like beautiful gardens, and abound in delightful places for excursions. The Cascine, which takes its name from the dairy to which the extensive pastures and pleasure grounds are annexed, is the chief park of Florence for the display of equestrian and fashionable equipages. The drives are fine, and the surrounding scenery is superb. The people are lively, polite, and intelligent, with a refinement of manner and language which extends even to the lowest classes, whose style of speech is singularly graceful, delicate, and expressive. The climate, the cheapness of living, the galleries of art, and the refinement of the people render Florence a particularly pleasant place of residence, and have attracted to it great numbers of foreigners, especially English and Americans. During the occupancy of the city by the Italian government, Florence was one of the gayest capitals in Europe. — Florence was called Florentia by the Romans. It is supposed to have been founded by the dictator Sulla, about 80 B.C.; but it seems to have been of little importance till the later ages of the Roman empire. In 466 it was a considerable city, and was besieged by the Vandals, at the head of a great army of Vandals, Burgundians, Alans, and other barbarians. Stilicho raised the siege and captured and put to death the barbarian monarch. About the middle of the 6th century it was destroyed by Totila, king of the Ostrogoths. Charlemagne rebuilt it at the end of the 8th, and during the next two centuries it grew in importance, till in the 10th the people acquired the right of electing their own magistrates. The city was governed by a senate of 100 persons, with an executive of four, and afterward of six consuls. In 1207 the chief executive functions were assigned to a single magistrate called the podestà. In 1215 the Florentines began to take part in the civil war between the Guelfs and the Ghibellines which convulsed Italy. After a contest lasting for 25 years, the Guelf party was defeated and expatriated from the city. A few years later the citizens took arms against the nobles, defeated them, demolished their fortified palaces, and established a democratic government, with two chief magistrates, one styled "the captain of the people" and the other podestà, and various councils chosen from all classes of the population. The feuds between Ghibellines and Guelfs were however renewed, and carried on with varying results. In 1282 the republic adopted a new system of government, which continued unchanged for several centuries. A long series of civil wars between the factions of the Bianchi and Neri (whites and blacks) ensued, in spite of which the city grew very rich and powerful. It became the financial capital of Europe, and its merchants carried on an immense trade with foreign countries. The population amounted to 150,000, and the armed militia, who could be called together by the tolling of a bell, were reckoned at 25,000. In 1542 Gaultier de Brienne, an adventurer who bore the title of duke of Athens, became lord of Florence by a coup d'état; but after a year of cruel despotism he was deposed and driven from the city by a sudden insurrection. The anniversary of this revolution, July 26, 1848, is still celebrated at Florence. The republic was restored, and continued to flourish in spite of factions, insurrections, and civil and foreign wars, till the 15th century, when the family of the Medici obtained a controlling influence in its affairs, which resulted in the final overthrow of republican institutions in the 16th century. (See Mandoni, and Tuscany.) In 1549 Florence was for a short time the seat of a provisional government. It was the scene of a revolution, April 27, 1859; and in March, 1860, the people voted for annexation to Sardinia. It was decreed to be the capital of the new kingdom of Italy, Dec. 11, 1864. Victor Emmanuel and his court removed thither from Turin May 18, 1865, and on the day following the 600th anniversary of Dante's birth was celebrated. In July, 1871, the seat of government was transferred to Rome. — Of the older histories of the city, Luchini's "Italia e Firenze," Nardi's "Storia della città di Firenze," and Varchi's "Storia fiorentina" are the most important. A "Florentine History," by H. E. Napiere (vols. 12mo), was published in London in 1848—7, and a "History of the Republic of Florence," by Adolphus Trollope, in 1846. For descriptions of Florence see "European Capitals," by William Ware (Boston, 1851), "Six Months in Italy," by George B. Hillard (6th ed., Boston, 1858), and "Walks in Florence," by Susan and Joanna Horner (2 vols. 12mo, London, 1878).

FLORENCE, Council of, the 16th general council of the church, according to Roman Catholic theologians. It was convened in Ferrara by Eugenius IV. for the purpose of remitting the eastern and western churches. The first session was held in Ferrara Jan. 10, 1438. Albergati presiding as cardinal legate. The pope himself opened the second session, Feb. 15, and on March 10 the Greek emperor John VI. or VII. was present, with the patriarch of Constantinople and a number of eastern prelates. The
public discussion of the doctrinal differences between the churches commenced the next day, and was continued without any satisfaction to either side until the breaking out of the plague obliged the pope, Jan. 10, 1439, to transfer the council to Florence. The number of prelates from the East particularly had been now more than trebled, and the emperor, whose power was daily undermined by the advance of the Mussulmans, urged the bishops to come to an understanding. At length, on June 8, a doctrinal agreement was reached on the procession of the Holy Ghost, and the addition to the Nicene creed of the words *Filioque*, and it was signed by all present. Another month's continuous debating brought both parties to an agreement on the remaining points, viz.: purgatory, the use of unleavened bread in the eucharist, and the primacy of the bishop of Rome. On July 6, the pope officiating, and the Greek emperor being present with his bishops, the solemn doctrinal decree on which both East and West agreed was promulgated by Cardinal Cessarini. The emperor and the eastern prelates took their departure from Florence Aug. 26; but the sessions continued, to afford the other eastern communions an opportunity of ratifying what was done. A decree of union with the Armenian church was published on Nov. 23, and another with the Jacobites of Abyssinia on Feb. 5, 1441. Canonists are generally agreed in considering this council to have ended in the solemn session of April 24, 1442. The two supplementary sessions held afterward in Rome had for their object the reunion of the Syrians, Chaldeans, and Maronites, for which preliminary steps had been taken in Florence.

**Flores**, the westernmost of the Azores islands in the N. Atlantic ocean; lat. 39° 25' N., lon. 19° 15' W.; length 10 m., breadth 9 m.; pop. in 1864, 10,822. Its name was given it by the Portuguese in allusion to the multitude of flowers with which it appeared to be adorned. Chief towns, Lagos and Santa Cruz.

**Flores, Flores, Ende, or Mangaral, an island of the Malay archipelago, N. W. of Timor, between lat. 8° and 9° 10' S., and lon. 119° 50' and 128° E.; length E. and W. about 200 m., average breadth 45 m. The strait of Flores on the east separates it from the islands of Solor and Adenan. It has a hilly surface, and like all the islands of the same chain is of volcanic formation. There are several active craters, one of which is 7,000 ft. high. The island produces copper, according to native accounts, and also gold and iron, but not sufficient to be profitably worked. The forests yield sapan wood and dye wood; rice, maize, edible roots, and a good species of cotton, are cultivated. Cotton is exported to Celebes. The other principal articles of trade are benzoin, ambergis, beeswax, slaves, and ships' provisions, payment for which is made in cutlery, gunpowder, glassware, and linen. The natives are divided into a number of distinct nations, all speaking different languages. The principal towns are Endé, with about 300 houses, which has a large and safe harbor; Mangaral on the N. coast; Pota on the same side, the site of a Dutch fort and trading post; and Larantuka on the S. E., where the Portuguese have a small settlement.—The Portuguese visited the island at an early period, and gave it the name of Flores. It was subordinate for a time to the Dutch presidency on Timor island, but in 1812 the English expelled all the European settlers. Christianity has obtained a foothold by the labors of Portuguese missionaries, and the native traders generally sail under the Portuguese flag.

**Florian*, Jean Pierre Charles de, a French author, born at the chateau de Florian in Languedoc, March 6, 1755, died in Sceaux, Sept. 18, 1794. His uncle, the marquis de Florian, placed him when 18 years old at Ferney with Voltaire, where he remained three years, when he became page to the dukes of Penthièvre, who subsequendy procured him a commission in a regiment of cavalry. He left his troop to attach himself as a gentilhomme de couer to the duke, at whose residence he pursued his literary avocations. Several of his dramas were performed at the theatre of D'Argental, and on these occasions Florian often played the part of harlequin. Though not the best of his works, some of his plays, as *Les deux billets, Le bon père, La bonne mère, &c.*, have considerable merit, and the first still holds its place on the French stage. In 1788 he produced his *Galatée*, a novel in imitation of the "Galatea" of Cervantes; and in 1786 his *Nu- ma Pompadour*, a classic romance in the style of Fénélon's *Thélème*. After these appeared *Estelle*, a pastoral tale, *Gonçalves de Coleodi*, with a preliminary sketch of Moorish history, and a collection of tales which are deemed the best that have been produced in France since La Fontaine's. He wrote also several poems. On the outbreak of the revolution he was consigned to a dungeon, where he finished his poem of *Éphraïm*, and wrote his romance of *Guillaume Tell*. He was liberated after the 9th Thermidor, but soon fell a victim to grief. After his death appeared his translation of "Don Quijote." The best uniform edition of his works is that of Paris in 1820, 16 vols.

**Florian*, Saint, a German martyr, born at Zeiselmauer, Lower Austria, about the year 190, served as a captain in the Roman army, and was drowned for his adherence to Christianity, near Lorch on the Enns, in 280. According to a legend, he presented himself immediately after his death to a pious woman, whom he requested to bury his remains on the site of the present Augustinian monastery near the village of St. Florian, in the vicinity of Linz. His bones were sent to Rome, and in 1183 to Poland, of which country he became the patron saint. His anniversary is celebrated Aug. 4; and on account of the emblems by which he is represented, his protection is often
invoked against confabulations. The monastery of St. Florian, said to have been founded in 455 by St. Severin, contains a magnificent church, organ, and bell, a library of 40,000 volumes, a numismatic and other collections, and a pleasant garden and horticultural school. The adjoining Tilly castle has belonged to it since 1636.

**FLORIDA**, the southernmost state of the American Union, and the 14th admitted under the federal constitution, situated between lat. 24° 30' and 31° N., and lon. 86° and 87° 45' W.; bounded N. by Alabama and Georgia, E. by the Atlantic ocean, S. and W. by the gulf of Mexico and the Perdido river, the latter dividing W. Florida from the gulf section of Alabama; area, 59,288 sq. m., or 27,931,520 acres. The state is divided into 69 counties, viz.: Alachua, Baker, Bradford, Brevard, Clay, Columbia, Dade, Duval, Escambia, Franklin, Gadsden, Hamilton, Hernando, Hillsborough, Holmes, Jackson, Jefferson, Lafayette, Leon, Levy, Liberty, Madison, Manatee, Marion, Monroe, Nassau, Orange, Polk, Putnam, St. John's, Santa Rosa, Sumter, Suwanee, Taylor, Volusia, Wakulla, Walton, and Washington. The cities of the state are: Jacksonville, which had 6,912 inhabitants in 1870; Pensacola, 3,348; Tallahassee, the capital, 2,023; and St. Augustine, 1,717. Key West (called by the Spaniards Cayo Hueso or Bone Key) is a place of great commercial and military importance. Pensacola, Appalachiucola (1,129 inhabitants), and St. Mark's are ports of W. Florida. Cedar Keys, Tampa, and Charlotte Harbor are the principal outlets on the W. side of peninsular Florida. St. Augustine, on the Atlantic coast, is the oldest town in the United States, and is much resorted to by invalids on account of its equable climate. Jacksonville is a thriving commercial city on St. John's river, and likewise a resort of invalids. Fernandina (1,253 inhabitants) is a town at the N. end of Amelia island, and is the Atlantic terminus of the railroad which has its gulf terminus at Cedar Keys. It has one of the best harbors on the southern coast. The population of Florida has been as follows:

In 1870 the state ranked 38d in point of population. Of the total population, 94,048 were males and 93,800 females; 192,781 were of native birth, of whom 189,554 were born in the state, and 4,967 were foreign born, including 1,155 born in Cuba and 1,101 in other parts of the West Indies. The density of population was 8.17 to a square mile. There were 89,894 families with an average of 4.77 persons to each, and 41,047 dwellings with an average of 4.57 persons to each. Between 1860 and 1870 there was an increase of 38.7 per cent. in the total population: 25.56 per cent. in the white, and 40.29 per cent. in the colored. The number of male citizens 21 years old and upward in 1870 was 85,854. There were in the state 68,897 persons between the ages of 5 and 18 years, including 60,990 colored; the total number attending school was 12,778, of whom 4,624 were colored; 66,288 persons 10 years old and upward were unable to read, and 71,808 could not write. Of the latter, 54,866 were males and 37,182 females; 18,904 were white, and 52,984 colored; 12,786 were from 10 to 15 years of age, 14,675 from 15 to 21, and 44,334 were 21 or over, of whom 3,876 were white males, 5,600 white females, 16,806 colored males, and 18,053 colored females. The number of paupers supported during the year ending June 30, 1870, was 147, at a cost of $9,850. Of the total number (148) receiving support June 1, 1870, 80 were white and 68 colored. The number of persons convicted of crime during the year was 383. Of the total number (179) in prison June 1, 1870, 28 were white and 151 colored. The state contained 88 blind, 48 deaf and dumb, 29 insane, and 100 idiotic. Of the total population 10 years of age and over (181,119), there were engaged in all occupations 60,708 persons, of whom 50,877 were males and 9,826 females; in agriculture, 42,492, including 31,033 agricultural laborers, and 11,165 farmers and planters; in professional and personal services, 10,897, of whom 197 were clergymen, 4,006 domestic servants, 4,065 laborers not specified, 149 lawyers, 248 physicians and surgeons, and 250 teachers not specified; in trade and transportation, 8,028; in manufactures and mechanical and mining industries, 4,231. The total number of deaths during the year was 2,254. Of these, 760 were from general diseases including 107 from enteric fevers, 45 from yellow fever, 130 from intermittent fever, 84 from remittent fever, 26 from typho-malarial fever, 131 from consump-
tion, and 71 from droopy; 383 from diseases of the nervous system, of which 89 were from encephalitis and 138 from meningitis; 129 from diseases of the circulatory system; 385 from diseases of the respiratory system, including 268 from pneumonia; and 398 from diseases of the digestive organs.—Florida, exclusive of islands, consists of a long narrow strip of territory extending S. from Georgia and Alabama from 30 to 90 m., and from the Atlantic ocean to the Perdido river about 860 m.; and of a peninsula extending from the mainland S. through five degrees of latitude between the Atlantic and the gulf of Mexico. Its coast line is of much greater extent than that of any other state, having a length of 472 m. on the Atlantic and 674 m. on the gulf; but this immense stretch of sea front is almost inaccessible on account of shallow soundings, and has few good harbors. S. from the mainland a chain of small rocky islands, called cays or keys, extends S. W., ending in a cluster of rocks and sand banks called the Tortugas. S. of the bank upon which these keys rise, and separated from them by a navigable channel, is a long narrow coral reef known as the Florida reef, which here constitutes the left bank of the Gulf stream. The most important of the keys is Key West. For a long period the haunt of smugglers and pirates, it is now a naval station of great importance, and the seat of a band of wreckers whose business it is to assist vessels in distress. This key is about 6 m. long and 2 broad, with a large, well sheltered harbor. The extensive ponds there yield annually a large amount of salt. The Tortugas derive their name from the vast number of turtles found in the neighboring waters. The most important harbors are: on the gulf coast, Pensacola, Appalachee, St. Mark's, Cedar Keys, Tampa, Charlotte, and Key West; and on the Atlantic coast, St. Augustine and Fernandina. Jacksonville on St. John's river has also a good harbor.—The rivers of Florida are numerous, and many of them afford great facilities for internal navigation. St. John's river rises in the great southern marsh, and reaches the ocean after a N. course of 800 m. in lat. 30° 30' N.; for nearly 100 m. from its mouth it is a wide sluggish sheet of water, more resembling a lagoon than a river. It is navigable to Lake George, about 100 m., for vessels drawing 8 ft. of water, and nearly to its head for smaller craft. Indian river is a long lagoon on the E. side of the peninsula, and communicates with the ocean by an outlet in lat. 27° 30'. It is proposed to connect these two waters by a short canal, and by this means secure an inland navigation from the mouth of the St. John's to Jupiter inlet, a distance of about 250 m. Charlotte and Aman- uare are the principal rivers on the W. side, the whole of which of S. of the Suwanee contains only small streams. The Suwanee is formed by the Withlacoochee and Alaspha from Georgia, and reaches the gulf at Wacassa bay. The Ockloonee also rises in Georgia. The Appalachee, formed on the N. frontier by the junction of the Chattahoochee and Flint, falls into the bay of the same name after a navigable course of about 75 m. The Choctawhat- chee, Escambia, and Perdido rise in Alabama and flow S., the first into Choctawhatchee bay, the second into Pensacola bay, and the last into Perdido bay, arms of the gulf of Mexico. The St. Mary's in the N. E. is common also to Georgia; it flows into the Atlantic in about lat. 80° 40' N., and is navigable for steamers to the town of St. Mary, and much further for sloops. The surface of Florida is dotted with numerous lakes, some of which are navigable for large steamers. Lake Okeechobee, in the Everglades, is about 40 m. long and 30 m. wide.—The S. portion of peninsular Florida, from about lat. 28°, is mostly an extensive swamp or marsh, called the Everglades, which during the rainy season between June and October is impassable. N. of this tract to Georgia the surface is generally a dead level, but in some parts it is undulating, and occasionally hilly. W. of the neck of the peninsula the ground is more uneven and rugged; but still the elevations are inconsiderable and of very limited extent. The substratum of the E. part of the peninsula is clay mixed with sand, and that of the W. a kind of rotten limestone, which in many places is undermined by subterranean streams. The central district is the most productive, but even here a large portion is composed of poor pine barrens; yet in the midst of these are found gentle eminences (called hummocks) of fertile land, supporting a vigorous growth of oaks and hickories, while numerous rivulets of pure water flow through the country or expand into beautiful lakes. Further W. the land is more generally poor. The warmth and humidity of the climate compensate in a great measure for the inferior character of the soil, and give it a vegetation of great variety and luxuriance.—The productions of Florida are chiefly those which require a tropical sun. Sea island cotton (the production of which was formerly confined to a few small islands off the coasts of South Carolina and Georgia) will grow luxuriantly even in the centre of the peninsula, and a fine quality of this staple has been produced on the Suwanee. The soils are also adapted to the successful cultivation of the coffee plant, the cocoa palm, the sugar cane, cotton, tobacco, rice, indigo, arrowroot, Sisal hemp, New Zealand flax, &c.; and the climate is suitable for the cochineal insect and the silkworm. The principal forest trees are red, live, and water oaks, mahogany, palmetto, magnolia, dogwood, and in the swamps, pines, cedars, and cypress. Oranges, lemons, limes, pineapples, olives, and grapes flourish luxuriantly; and garden vegetables are produced in the greatest abundance. The driest seasons are relieved by heavy dews, and the sun that would bake the earth in other parts, and wither vegetation, is so tempered by
the pervading moisture as to cover the surface with perennial verdure. The prairies afford excellent pasture. Cattle require little care from their owners, and no housing in winter; and in most parts of the state hogs fatten without any other support than that which they derive from the roots and mast of the forests. Deer of various kinds abound, and smaller game is found in all parts of the country. The coast waters produce the finest fish, including the sheepshead, grouper, redfish, and mullet, beside green turtle and oysters; and the numerous lakes and rivers of the interior teem with fresh-water species. On many parts of the coast sponge is found, and the trade in it is constantly increasing. Among the mineral productions are amethysts, turquoises, lapis lazuli, ochre, coal, and rich iron ore. Among the most remarkable natural curiosities are the hollows called "sinks," worn in the soft limestone by subterranean streams, and varying in size from a few yards to several acres. The great sink of Alachua county, by which the waters of the Alachua savanna are supposed to flow into Orange lake, is a large basin almost surrounded by hills, into which the drainage of the savanna is conveyed by several conduits, uniting before they reach the basin in a single stream. From the basin the waters descend slowly by three great vent holes into the earth, and are carried by underground channels to other basins. Numerous springs, bursting from great depths, some of them with sufficient force to turn a mill, are found in different parts of the state, and have led to the supposition that the parts of the country in which they exist may be underlain by vast caverns through whose roofs the springs well up wherever an opening can be found. About 12 miles from Tallahassee is a lake of icy cold transparent water, which is fed by an underterranean source of this kind. The climate of Florida is one of the finest in the world. The following meteorological summary from observations made at Jacksonville, lat. 30° 15', is reported by the chief signal officer of the United States:

In the south the temperature scarcely changes the year round, and summer is only distinguished by the copiousness of its showers. The average mean temperature of the state is about 78° F., and the difference between summer and winter does not generally exceed 20°. While at Key West it is not more than 11°. The thermometer seldom rises above 90° in summer, and rarely falls below 80° in winter. Frost is unknown in southern Florida, and very little ice is formed in the northern part of the state. The atmosphere is generally dry and clear. Owing to the evenness and salubrity of its climate, Florida has long been a popular resort for invalids, and especially those afflicted with pulmonary complaints. Of the total deaths from all causes in Florida in 1870, as reported by the federal census, only 181 were from consumption. There were 17-8 deaths from all causes to one from consumption. The advantages of the climate in this respect are further shown by a comparison of the statistics relating to consumption as reported by the census of 1870, from which it appears that the ratio of deaths from consumption to those from all causes was less in Florida than in any other state except Nevada; and this advantage becomes still greater when it is considered that Florida being a popular resort for consumptives, a large proportion of those who die there from that cause came with the disease from other states.—According to the census of 1870, the state contained in farms 786,172 acres of improved land, 1,425,786 of woodland, and 211,588 of other unimproved land. The total number of farms was 10,241; cash value of farms, $9,947,920; of farming implements and machinery, $508,074; total amount of wages paid during the year, including value of board, $1,537,060; total (estimated) value of all farm productions, including betterments and additions to stock, $8,909,746; value of orchard products, $5,839; of produce of market gardens, $51,938; of forest products, $7,955; of home manufactures, $181,698; of animal food, slaughtered or sold for slaughter, $520,966; of all live stock, $3,212,157. There were on farms 11,902 horses, 8,885 mules and asses, 61,929 milch cows, 6,292 working oxen, 823,701 other cattle, 26,599 sheep, and 168,908 swine. The chief productions were 2,236,066 bushels of Indian corn, 114,204 of oats, 64,846 of peas and beans, 10,218 of Irish and 759,456 of sweet potatoes, 93,789 bales of cotton, 401,677 lbs. of rice, 157,405 of tobacco, 37,565 of wool, 100,984 of butter, 50,884 of honey, 6,062 of wax, 952 hogheads of sugar, and 344,839 gallons of molasses. The total number of manufacturing establishments in 1870 was 659, having 126 steam engines of 3,172 horse power and 79 water wheels of 528 horse power, and employing 2,749 hands, of whom 2,670 were males above the age of 16. The capital invested amounted to $1,679,900; wages paid during the year, $989,582; value of materials used, $2,830,878; of products, $4,685,408. The leading industries were 188 flouring and girt mills, which had $119,075 capital invested, and from $411,807 of materials yielded products valued at $508,888; 104 establish-
ments for sawing lumber, with 69 steam engines of 2,467 horse power and 1,116 hands; capital, $755,090; wages paid, $451,390; value of materials $1,169,288, of products $2,835,780. There were 27 establishments for the manufacture of molasses and sugar, whose products were valued at $41,510. The fisheries of Florida might be of great value, but as yet this industry has been but slightly developed. According to the census of 1870, the value of the fisheries for that year was $101,528. — Florida has seven ports of entry: Apalachicola, Fernandina, Key West, Pensacola, St. Augustine, St. John's, and St. Mark's. The value of the imports from foreign countries for the year June 30, 1878, was $505,571, and of the domestic exports $2,984,975. Of the former $389,064 were entered at Key West, and of the latter $1,591,532 were from the port of Pensacola. The chief articles of export are lumber, cotton, tobacco, and fish. The number and tonnage of vessels entering from and clearing for foreign countries, and of those registered, enrolled, and licensed at the different ports, were as follows:

<table>

The coasting trade is also very extensive, employing numerous steamers, which with other craft carry immense freights to Savannah, Charleston, Baltimore, Philadelphia, and New York. But a large portion of the material exported from Pensacola and Apalachicola originates in southern Alabama and southwestern Georgia. The great bulk of foreign merchandise consumed in the state is also entered coastwise, chiefly from the northern ports. The number of vessels that entered and cleared in the coastwise trade during the year ending June 30, 1878, was as follows:

<table>

Ship building is carried on at all of these ports. During the year 14 vessels of 241 tons were built. — In 1876 there were 466 m. of railroad in Florida. The Jackson, Pensacola, and Mobile railroad extends W. from Jacksonville across the N. part of the state, and is intended to afford direct communication with Pensacola and Mobile. In 1873 it was in operation from Jacksonville to the Chattahoochee river, 209 m. The Florida branch extends from Live Oak N. to Lawton, Ga., on the Atlantic and Gulf railroad, and another branch extends S. from Tallahassee to St. Mark's. The Atlantic, Gulf, and West India Transit company's railroad connects Fernandina on the Atlantic and Cedar Keys on the gulf, 155 m. The St. John's River railroad extends from St. Augustine to Toocoi on St. John's river, 14 m., where connection is made with steamers to Jacksonville. The Pensacola and Louisville railroad extends from Pensacola to Pollard, Ala., on the Mobile and Montgomery railroad, 45 m. — The legislative authority is vested in a senate and assembly, designated the "legislature of the state of Florida." There are now 53 representatives and 24 senators. The sessions are annual, beginning on the first Tuesday after the first Monday of January, and may extend to 60 days. Members of the assembly are chosen for two years and senators for four years. The governor is elected for four years. He is required to be a qualified elector, and to have been a citizen of the United States nine years and of Florida three years next preceding the time of his election. A lieutenant governor is elected, whose term of office and eligibility are the same as those of the governor. The governor is assisted by a cabinet of administrative officers, consisting of a secretary of state, attorney general, comptroller, treasurer, surveyor general, superintendent of public instruction, adjutant general, and commissioner of immigration. These officers are appointed by the governor and confirmed by the senate, and hold office the same time as the governor, or until their successors be qualified. The governor is required to appoint in each county, with the consent of the senate, an assessor of taxes and collector of revenue, a county treasurer, county surveyor, superintendent of common schools, and five county commissioners, each of whom shall hold office for two years. Such officers are subject to removal by the governor, but only for wilful neglect of duty, a violation of the criminal laws of the state, or for incompetency. The governor and cabinet constitute a board of commissioners of state institutions, with supervision of all matters connected therewith. The judicial power is vested in a supreme court, circuit courts, county courts, and justices of the peace. All judges are appointed by the governor and confirmed by the senate; justices of the peace are also appointed by the governor. The supreme court judges hold office for life or during good behavior; those of the circuit courts for eight and of the county courts for four years. The supreme court consists of a chief justice and two associates, and holds three terms annually in Tallahassee. There are seven circuit courts, each having one judge. In addition to the usual functions, the county courts have full
surrogate or probate powers, but subject to appeal. Besides the above mentioned, the legislature may establish courts for municipal purposes only in incorporated towns and cities. A state attorney in each judicial district is appointed by the governor with the consent of the senate; also in each county a sheriff and clerk of the circuit court, who shall also be clerk of the county court and board of county commissioners, recorder, and ex officio auditor of the county, each of whom shall hold office for four years. The right of suffrage is conferred upon every male person of the age of 21 years and upward, provided he be a citizen of the United States or has declared his intention to become such, and has resided in Florida for one year, and in the county where his vote is offered for six months next preceding the election. The salary of the governor is $5,000 a year; of the lieutenant governor, $3,500; of cabinet officers, $2,000; of justices of the supreme court, $4,000, and of the circuit court, $3,500. Florida is entitled to two senators and two representatives in congress. Provision is made for a state census to be taken in 1875 and every tenth year thereafter. The constitution provides that "institutions for the benefit of the insane, blind, and deaf, and such other institutions as the public good may require, shall be fostered and supported by the state;" but no such institutions have yet been established. The penitentiary at Chattahoochee contained in 1873 an average of 48 convicts: they are employed under contract outside the prison. The total cost of maintaining the prison in 1873 was $20,078. The total assessed value of real estate in 1870 was $20,197,691, and of personal estate $12,283,183. The true value of real and personal estate was $44,168,635. The total taxation not national was $496,186, including $348,768 state, $148,902 county, and $78,009 town, city, &c. The total receipts into the state treasury during the fiscal year were $119,459, of which $175,467 were from general taxes, $14,596 from licenses, and $2,926 from miscellaneous sources. The disbursements amounted to $295,078, of which $23,943 were for the executive department, $78,587 for the legislature, $89,677 for the judiciary, $13,599 for schools and educational purposes, $7,665 for interest, $14,383 for printing, $16,982 for the penitentiary, $4,928 for the militia, and $47,442 for contingent and miscellaneous expenses. The bonded debt, Jan. 1, 1873, was $2,619,973, including bonds to the amount of $4,000,000 issued to the Jacksonville, Mobile, and Pensacola railroad. In addition to this there was a floating debt of $294,927. The constitution requires the legislature to provide a uniform system of common schools and a university for the free education of all children. The general supervision of the educational interest of the state is intrusted to a superintendent of public instruction, who with the secretary of state and attorney general constitutes the board of education for the state. The common school fund is derived from the proceeds of all lands granted to the state by the United States for educational purposes; gifts by individuals, and the appropriations by the state; escheated and forfeited lands; money paid for exemption from military duty; all fines collected under the penal laws of the state; such portion of the per capita tax as may be prescribed by law for educational purposes; and 25 per cent. of the sales of public lands by the state. In addition to the other means provided, a special tax of not less than one mill on the dollar of all taxable property in the state is required to be levied. The common school fund must be distributed among the several counties in proportion to the number of children between the ages of 4 and 21 years. Each county is required to raise annually by tax a sum not less than one half the amount apportioned for the common school fund. Any school district neglecting to establish and maintain for at least three months in the year such schools as are required by law, forfeits its portion of the common school fund. The amount of the school fund in 1873 was $281,785. The whole number of schools in the state was 444, and of pupils 16,258. About one fourth of the school population were enrolled in the public schools. The average duration of school was four and two thirds months. Florida is singularly deficient in institutions for advanced instruction. Lands have been granted by the general government, amounting in 1873 to 82,714 acres, for the support of two seminaries in East and West Florida. In 1873 the Florida state agricultural college was incorporated, which is designed to afford educational facilities to the working classes and prepare them for agricultural and mechanical pursuits. According to the census of 1870, the whole number of libraries was 253, with an aggregate of 112,928 volumes. Of these 178, with 87,554 volumes, were private. There were in the state 28 newspapers and periodicals, with a total circulation of 10,545; annually issued, 649,220 copies: 2 were tri-weekly, circulation 830; 1 semi-weekly, circulation 800; and 28 weekly, circulation 9,425. The total number of religious organizations was 420, having 930 edifices, with 78,920 sittings, and property valued at $426,520, as follows:

The name of Florida (which signifies the florid or flowery, and was given by the Spaniards in allusion to the aspect of the country, and partly also because it was first visited by
them on Pascua Florida, or Easter Sunday) was originally not confined to the present state limits, but extended over an indefinite region northward, and to the Mississippi. The first visitant to the actual territory of Florida was Ponce de Leon, who landed near St. Augustine in 1518. It was subsequently visited in 1521 by Vasquez, a Spaniard; in 1528 by Verrazzano, a Florentine; and in 1534 by De Geray, a Spaniard. Two years later Pizarreo de Narvaz obtained a grant from Charles V. of all the lands from Cape Florida to Rio Panuco. In 1588 he landed with a numerous army at Apallachee, but met with a formidable resistance from the Indians, and at last perished on the coast near the Panuco by shipwreck, only 10 of his followers returning to Spain. In 1589 Fernando de Soto explored Florida. About the middle of the 16th century many Protestants of France sought refuge in Florida, but only to experience greater evils than they had endured at home. In 1668 they were attacked by the Spaniards, and many were hanged on the trees with an inscription purporting that they were destroyed “not as Frenchmen, but as heretics.” This barbarity was soon afterward avenged by a party of Frenchmen, who attacked the Spanish fort, and hung up the garrison on the same trees that sustained the moulderig bones of their countrymen, inscribing over them that they were executed “not as Spaniards, but as cutthroats and murderers.” The Spaniards, persevering in their attempts to obtain a foothold in Florida, established a fort at St. Augustine in 1565, which they held till 1586, when it was captured by Sir Francis Drake. Two years earlier Captains Barlow and Amidas had taken nominal possession in right of England of the northern portion of the coast and the adjoining country. From this period for nearly a century, history is silent in relation to this country. In 1682 La Salle visited West Florida or Louisiana. In 1696 Pensacola was founded by Spaniard. In 1702 the Carolinians made an unsuccessful attack on St. Augustine, but in 1704 captured Fort St. Mark. The subsequent expedition of Oglethorpe against the Spanish settlements will be spoken of in the article Georgia. In 1768 the whole province of Florida was ceded to Great Britain in exchange for Cuba, which the English had then recently taken. Soon after the British divided the territory into two provinces, the river Appalachicola being the boundary between them, and by a proclamation invited settlers. Many Carolinians emigrated thither; and about 1,500 Greeks, Italians, and Minorca were brought from the Mediterranean and settled at New Smyrna, about 60 m. S. of St. Augustine, where they began the cultivation of indigo and the sugar cane. Being badly treated by their employers, they returned to St. Augustine. During the revolutionary war privateers were fitted out at the ports of Florida, by which the trade of the southern provinces was severely harassed, and the Indians were encouraged to a barbarous hostility against the Americans. In 1778 Gen. Prevost marched from Florida into Georgia, and captured Savannah and other towns. While engaged on this expedition he left his province open to incursions from Louisiana. In 1779 the Spaniards invested the garrison and settlement of Baton Rouge, and compelled them to surrender, and in May, 1781, Pensacola was captured. By the treaty of 1788 Florida was retroceded to Spain, and the greater part of the inhabitants deserted the country and settled in the United States. When Louisiana was ceded to the United States by France in 1803, it was declared to be ceded with the same extent that it had in the hands of Spain, and as it had been ceded by Spain to France. The terms of this cession gave rise to a claim on the part of the United States to the country west of the Perdido river; and to prevent the occupation of this territory by any other power, the government took possession in 1811 of the principal posts. The rest of Florida remained unmolested until the second war between the United States and Great Britain. In 1814, a British expedition having been fitted out from Pensacola, Gen. Jackson marched against that town and captured it. In 1818 it was again taken by Jackson, and also Fort St. Mark, but they were subsequently restored to Spain. Finally in 1819 Spain ceded the whole province to the United States, and possession was surrendered to the Americans in July, 1821. Immigration now set in to the territory, but the lack of surveys, the uncertainty of titles, &c., prevented its rapid settlement; and the Seminoles, a fierce and warlike Indian race, occupied the best lands. Yet in spite of these obstacles, a considerable population settled in the country. In 1835 a deadly war between the Indians and settlers broke out, and suspended what progress had hitherto been effected. A long contest ensued between the savages and the United States. In 1842 the fort is known as the Seminole war, and resulted in 1842 in the subjection of the Indians, of whom the greater part were removed west of the Mississippi. The few remaining Indians continued to be troublesome, and on several occasions committed great depredations on the settlers; but on May 4, 1858, the whole body was removed, and on the 8th Gen. Loomis, then commanding in Florida, issued a proclamation declaring the war closed. Florida was admitted into the Union, March 3, 1845. An ordinance of secession from the Union was passed Jan. 10, 1861, by a convention which had assembled on the 8th. On the 7th Fort Marion, the arsenal at St. Augustine, and the Chattahoochee arsenal were seized by order of the state authorities; and on the 12th the navy yard and forts at Pensacola were taken. Fernandina, Jacksonville, St. Augustine, and other places on the E. coast were taken by the national forces early in 1862, and held. Restrictions on commercial intercourse with
Florida were removed by proclamation of President Johnson dated April 29, 1865, and on July 13 William Marvin was appointed provisional governor. On Oct. 10 was held an election of delegates to a state convention, which assembled in Tallahassee on the 25th, and on the 28th repealed the ordinance of secession. Subsequently a legislature and state officers were elected, to whom the civil authority was transferred in January, 1866. Under the reconstruction measures of congress in 1867 Florida was made a part of the third military district, of which Maj. Gen. Pope was appointed commander. A convention to reorganize the state government was authorized by vote of the people in November. It assembled in Tallahassee Jan. 20, 1868, and subsequently framed a new constitution, which was ratified by the people in May. The legislature convened June 1, and adopted the 14th amendment to the federal constitution, in consequence of which Florida was recognized as a state by the general government. On July 4 the government was transferred to the state authorities. (See supplement.)

**FLORIDA BLANCA, José Molina, count of**, a Spanish statesman, born in Murcia about 1728, died in Seville, Nov. 20, 1808. His family was noble, but poor. He became an advocate, was appointed fiscal to the tribunal of the council of Castile, and made a report on the suppression of the Jesuita, which led to his appointment as ambassador to Rome. In 1777 he became premier to Charles III. In his administration of 15 years he built extensive roads, canals, bridges, and conduits; created more than 60 agricultural societies and numerous philanthropic institutions; founded the national bank of St. Charles, and the Spanish company of the Philippines; made treaties of commerce with the Porte, and concluded a treaty with Portugal which quieted the disputes about the South American colonies, and treaties with the emperor of Morocco and Hyder Ali; sought to avert the war against Spain by England in 1778, and made its burdens lighter on the people than those of any previous one of equal duration; made a treaty with Tripoli; punished the Algerine pirates; opened the trade with America to the world; reduced direct taxes and imposts; and introduced great and valuable reforms in the administration of justice. In 1792, after having been for three years the premier of the imbecile Charles IV., he was imprisoned in the castle of Pamplona, where but for his brother he would have perished from starvation. He was at length permitted to retire to Murcia. When the Spaniards rose against Napoleon in 1820 he was called to the presidency of the central junta of the kingdom, but soon sank under his onerous duties. Among his published works are: Respuesta fiscal sobre la libre disposición, patronato y protección inmediato de S. M. en los bienes ocupados a los Jesuitas (Madrid, 1788), and Julicío impartial sobre las letras en forma de breve publicadas por la curia romana, etc. (1789–90).

**FLORIDA EAST IN A SERIES OF ISLANDS, extending in the form of a crescent 220 m. S. W. along the S. coast of Florida, beginning near Cape Florida, and ending in the Dry Tortugas, belonging partly to Dade and partly to Monroe county; pop. in 1870, 5,558. They lie between the mainland and the Florida reefs, and from 3 to 5 m. from the Gulf stream. They are very numerous, and vary in extent from a few acres to 26 sq. m. Cayo Largo (Long Key) is the largest of these islets (about 80 m. long and 1/2 m. to 5 m. wide), and Key West the most important. They lie but a few feet above tide water, are of a uniform coral formation, very rocky, and mostly covered with a growth of hard wood.

**FLORENCE (It. fiorentina), a gold coin first issued in Florence in the 11th century, of about the value of a ducat, bearing an impression on the obverse of a lily, and on the reverse of John the Baptist. It was soon imitated in other cities of Italy and in France and Spain, and in Germany gave origin to the mediaval Goldgulden and the later Gulden, which are still distinguished by the abbreviation (Fl.). Florin is now the appellation both of gold and silver coins in Europe, which vary in value in different countries. (See Corns.)

**FLORES, Franz, a Flemish painter, whose real name was De Vriendt, born in Antwerp about 1520, died there, Oct. 1, 1570. He first studied sculpture and then painting, and established a school which brought forward many eminent artists. He enjoyed great popularity owing to his rapid and prolific pencil, and to the boldness of his designs. He was one of the most successful painters and one of the greatest drunkards of his day. His masterpiece, "The Fall of the Rebel Angels," is in the Louvre. His other principal works are "The Last Judgment," in the church of Notre Dame at Brussels, and "The Assumption," in the Antwerp cathedral.

**FLORES, Lucas Anneus, a Roman historian, probably of Spanish birth, lived under the emperors Trajan and Hadrian. He is the author of an epitome of Roman history, in four books, extending from the foundation of the city to the time when Augustus closed the temple of Janus. The work is believed by some to have been compiled from the lost books of Livy and other historians. The style is declamatory, abounding in extravagant conceits and metaphors, and panegyrics of the Romans. The Periculìum Veneris and three other short poems are with little authority ascribed to this writer, and the Epitomes of the books of Livy have also been attributed to him.

**FLOTTOW, Friedrich von, a German composer, born in Teutendorf, Mecklenburg-Schwerin, April 27, 1812. A fondness for music led him in early youth to Paris, where he was instructed in composition by Reicha. In consequence
of the revolution of 1880 he returned to Germany, but soon after went again to Paris with the operas *Pierre et Colombine*, *Rob Roy*, and *La duchesse de Guise*, composed in the mean while. He tried in vain to have these produced at one of the theatres of Paris, and it was only after their performance in private had excited the attention of amateurs that he received a commission in 1888 to furnish the music for *Le naufrage de la Méduse*. The opera was performed 54 nights at the Théâtre de la Renaissance, and it was afterward produced with equal success in London and other cities. He much increased his reputation by the *Forestier* (1840), *L’Enclave de Camoëns* (1843), *Alessandro Stradella* (1844), and *L’Ame en peine* (1846). After remaining some years in Paris, in 1855 he took up his permanent residence at Schwerin, and became director of the court theatre. There he composed *Albin* (1856), *Martha* (1860), and *Zita* (1866). Of all his operas *Martha* is the most popular, being sung in several languages.

**FLOTSAM**, an old word, used in connection with others equally barbarous, as jetsam and legam (or ligan), to designate different kinds of wrecked goods. Whether lawyers made them, or adopted them from seamen, is not certainly known; but the latter is supposed to be the case. Goods flotsam were goods which floated away when a ship was wrecked. Goods jetsam were those cast over from a ship in peril. Goods legam were goods which were cast out, but, because they would sink and be lost, were tied to wood or a cask or some other substance which would float. These words are now seldom if ever used; but the word jettison, formed probably from jetsam, is often used in insurance law and practice. It means properly the act of casting goods overboard; thus goods are said to be jettisoned, and a loss is said to be by jettison; and more rarely and inaccurately, the goods cast over are called the jettison; as, "the jettison consisted of such and such goods."

**FLOUNDER**, a flat fish of the family *pleuronectidae* or *planidae*, which also includes the halibut, sole, and turbot. This family, containing about 150 species, is found generally in comparatively shallow water, where the bottom is sandy; but the halibut and turbot are caught in deep water. The body is flat, compressed vertically, so that the dorsal and ventral surfaces are mere fin-bearing edges, the sides forming ovate disks variously colored, the darker being popularly called the back and the white side the belly, while in reality these surfaces are the sides. The most remarkable character of the family is the want of symmetry in the mouth and head, both eyes being turned to that side which is uppermost when the animal swims, and which is always the darker; the bones of the head, especially the presphenoid and the middle frontal, are distorted to allow this arrangement of the parts; behind the scapular arch there is no want of symmetry in the vertebral column. The dorsal fin fringes the whole back, from near the tail to as far forward as the nostrils, the anal fringing the lower edge in a similar manner; the jaws and the ventrals are generally unsymmetrical, the latter being smaller on the pale side. The branchiostegal rays are six; the air bladder is absent, and the vent is very far forward.—The flounder belongs to the genus *platessa* (Cuv.); in this the eyes are generally on the right side, one above the other; the teeth are broad and cutting, and in a single series in the jaws, but generally pavement-like on the pharyngeals; the dorsal commences over the upper eye, and neither it nor the anal extends to the caudal; there are three pancreatic caeca. The common flounder of Massachusetts (*P. plana*, Mitch.) varies in length from 10 to 22 in., and in color (on the right side) from dull slate to rusty and blackish brown; the scales are small, and the surface smooth. This species is considered excellent for the table in summer and autumn, and is caught in considerable numbers from wharves and bridges. Another species is the rusty dab (*P. ferruginea*, Storer), from 12 to 30 in. long, of a reddish slate color, with rusty spots, and the lower surface tinged with yellow. The New York flounder is the *P. dentata* (Mitch.), reddish brown, of about the same size, but considered inferior for the table. Among the species with eyes on the left side are the *P. oblonga* (Mitch.), growing to a length of 80 in., and the *P. stellata* (Pallas), an arctic flounder, of a liver-brown color, about a foot long. These species are said to be "reversed" when the eyes are on the left side in the first series, and on the right in the second; they are said to be "doubled" when both sides are colored; according to De Kay, the *P. melanogaster* (Mitch.) is a doubled variety of the *P. dentata*. Flounders extend, though in diminished numbers and of smaller size, into high northern latitudes; they are very abundant on the coasts of New Brunswick and Nova Scotia in summer. Like all the family, flounders are very tenacious of life, may be transported considerable distances, and may be naturalized in brackish and even in fresh water. The distortion of the flounder family admirably adapts
them for swimming on the bottom, where the situation of both eyes on the upper surface of the head allows an extensive range of vision; the coloration of one side, resembling the bottom on which they swim, serves as a protection against enemies. The food consists of minnows and other small fry, young fish, soft-bodied marine animals, and aquatic insects. There are 16 species in the British islands, which are gradually reduced to 18 in the Baltic, 10 on the coast of Norway, 5 at Iceland, and 3 in Greenland. The English plaice (P. vulgaris, Flem.), called also fluke in Scotland, is much esteemed; the spawning time is in February or March, and it is in the best condition for the table at the end of May. The English flounder is the P. flesus (Flem.), and may be distinguished from the plaice by the rough lateral line. The common dab (P. limanda, Flem.) derives the specific name from the roughness of its scaly surface, and, with other species, is considered excellent; they are taken by hook, spear, and net.

FLoureNS. - I. Marie Jean Pierre, a French physiologist, born in Maureilhain, Hérault, April 15, 1794, died at Montgeron, near Paris, Dec. 6, 1867. He received the degree of doctor of medicine when only 19 years old, and went to Paris, where he became acquainted with Chaptal, the Cuivers, and Geoffroy Saint-Hilaire. In 1821 he delivered a course of public lectures on the physiological theory of sensation, and presented to the academy of sciences a series of papers on the organization of men and animals. He was already a contributor to the Revue encyclopédique and to the Dictionnaire classique d'histoire naturelle. In 1822 his essay on the Détremination des propriétés du système nerveux was highly praised by Cuivier for accuracy and originality. His reputation was further enhanced by his Recherches sur les conditions fondamentales de l'audition et sur les diverses causes de surdité (1824), and by his Recherches expérimentales sur les propriétés et les fonctions du système nerveux dans les animaux vertébrés, which he completed in 1825 by his Expériences sur le système nerveux. The last two papers present a very ingenuous and thorough method of determining the relations of the individual organs to the various phenomena of intellect, sensation, and motion. In 1828 he was admitted to the academy of sciences, and appointed assistant professor of natural history in the collège de France. Two years later he became assistant lecturer on comparative anatomy at the jardin des plantes; in 1832 titular professor at the museum; and in 1835 professor of natural history in the collège de France. From 1841 to 1854 he published a series of small works, giving in a condensed form and perspicuous style the history and philosophy of several branches of science. His Cours sur la génétique, l'ovologie et l'embyologie, delivered at the museum of natural history and published in 1836 by Deschamps, and his Cours de physiologie comparée: de l'ontologie, ou étude des êtres, are equally remarkable for perspicuity and fulness. His Anatomie générale de la peau et des membranes muqueuses (1840, 1843) is intended to demonstrate anatomically the physical unity of mankind; and his Théorie expérimentale de la formation des os (1847) contains a demonstration of the principle that "matter changes and is renovated incessantly, while form and force persist." His most popular book is De la longévité humaine et de la quantité de vie sur le globe (1854). In 1863–5 he published an annotated edition of the complete works of Buffon. Among his later works are: Ontologie naturelle (12mo, 1851); Examens du livre de M. Darwin sur l'origine des espèces (1864); and De l'unité de composition et du débat entre Ouivier et Geoffroy Saint-Hilaire (18mo, 1865). In 1887 he was a member of the chamber of deputies for Béziers; in 1846 Louis Philippe made him a peer of France; and in 1864 he was a member of the municipal council of Paris; but he never took an active part in politics. At the time of his death he was perpetual secretary of the academy of sciences. Il Gustave, a French agitator, son of the preceding, born in Paris, Aug. 4, 1888, killed at Chatou, near that city, April 3, 1871. He filled in 1868 his father's chair at the collège de France, and published Science de l'homme (1866) and other works. In 1866–8 he participated in the Cretan revolution in the field and as a member of the Cretan assembly, and became involved in difficulties with the French minister at Athens. On his return to Paris his denunciations of Napoleon III. caused him to be arrested in April, 1869; and on his release three months afterward he was severely wounded in a duel with Paul Granier de Cassagnac, who had attacked him in his journal. He warmly supported the election of Rochefort as a deputy in November, became one of the founders and the chief editor of the Marseilleise newspaper, and was the master spirit of the demonstration at the funeral of Victor Noir, who had been shot by Prince Pierre Bonaparte. When Rochefort was arrested early in 1870, FloureNS attempted an armed resistance, and was sentenced to three years' imprisonment. He fled to England, returned to Paris
FLOYD

on the eve of the revolution of Sept. 4, and as a commander in the national guard took a conspicuous part in subsequent outbreaks. Early in 1871 he was again arrested and sentenced to death, but escaped. He reappeared in Paris after the insurrection of March 18, when he was elected member of the commune and the military commission, and commander of a regiment. At the disastrous termination of the march on Versailles, in which he commanded one of the three divisions, he was attacked by a body of gendarmes in a house in which he had taken refuge, and killed.

FLOYD, James, an American clergyman, born in New York, Aug. 20, 1806, died there, Oct. 14, 1868. He was educated in Columbia college, and studied three years in Europe. He was received into the New York conference of the Methodist Episcopal church in 1835 and appointed to Riverhead, and was afterward for 12 years pastor of important churches in Middletown, New Haven, Brooklyn, and New York. By the general conference of 1848 he was placed on the committee to revise the Methodist hymn book. To his energy, culture, and taste are largely due the excellence of this collection. In 1854 he was appointed presiding elder of the New York district of the New York east conference. In 1858 he was elected by the general conference editor of the "National Magazine," and corresponding secretary of the tract society; but in 1861 he returned to the pastorate, in which he continued till his death. Dr. Floy was noted as being among the earliest and most able anti-slavery men of the Methodist church. Besides editing the posthumous works of the Rev. Dr. Stephen Olin, he contributed largely to periodical and Sunday school literature.

FLOYD, the name of counties in five of the United States. I. A S. W. county of Virginia, drained by Little river; area, 380 sq. m.; pop. in 1870, 9,824, of whom 997 were colored. The surface is mountainous, the county being in the Blue Ridge region. It is well adapted to pastoralism. Copper and iron ore are found. The chief productions in 1870 were 38,419 bushels of wheat, 45,515 of rye, 128,799 of Indian corn, 98,059 of oats, 10,098 of potatoes, 3,466 tons of hay, 119,180 lbs. of butter, and 187,407 of tobacco. There were 1,846 horses, 3,769 milk cows, 4,159 other cattle, 7,956 sheep, and 7,820 swine. Capital, Jacksonville.

II. A N. W. county of Georgia, bordering on Alabama, and traversed by Coosa river and its branches; area, 549 sq. m.; pop. in 1870, 17,280, of whom 5,763 were colored. The surface is diversified, and in some parts mountainous; the soil of the valleys and river bottoms is good. Iron, plum-bago, galena, and other minerals are found. In the S. W. part is a mineral spring. The Selma, Rome, and Dalton railroad passes through the county. The chief productions in 1870 were 98,464 bushels of wheat, 24,991 of Indian corn, 43,229 of oats, 14,349 of sweet potatoes, and 2,183 bales of cotton. There were 1,086 horses, 1,143 mules and asses, 2,145 milk cows, 3,542 other cattle, 5,884 sheep, and 11,879 swine: 7 manufactories of carriages and wagons, 5 of bricks, 4 of iron and products of the same, 2 of sashes, doors, and blinds, 4 of tin, copper, and sheet-iron ware, 2 flour mills, and 6 saw mills. Capital, Rome. III. An E. county of Kentucky, intersected by the W. fork of the Big Sandy river; area, 500 sq. m.; pop. in 1870, 7,877, of whom 171 were colored. The surface is broken and affords good pasturage. Stone coal abounds. The chief productions in 1870 were 8,621 bushels of wheat, 388,009 of Indian corn, 26,825 of oats, and 7,795 of potatoes. There were 1,405 horses, 2,984 milk cows, 5,112 other cattle, 11,238 sheep, and 12,788 swine. Capital, Prestonsburg. IV. A S. E. county of Indiana, bordering on the Ohio river, which separates it from Kentucky; area, 148 sq. m.; pop. in 1870, 28,336. The surface is diversified, and the soil partly productive of stone, lime, sandstone, and slate abound. The Louisville, New Albany, and Chicago railroad passes through it. The chief productions in 1870 were 47,443 bushels of wheat, 124,807 of Indian corn, 66,110 of oats, 71,684 of potatoes, 4,509 tons of hay, and 98,348 lbs. of butter. There were 1,780 horses, 2,003 milk cows, 1,101 other cattle, 2,815 sheep, and 5,976 swine; 3 manufactories of boots and shoes, 7 of casks and wagons, 1 of carriages, 6 of clothing, 10 of barrels and casks, 2 of cutlery and edge tools, 3 of furniture, 2 of window glass, 7 of iron and its products, 5 of machinery, 3 of saddlery and harness, 2 of soap and candles, 5 of tin, copper, and sheet-iron ware, 1 of woollen goods, 4 planing mills, 4 breweries, 7 tanneries, 7 currying establishments, and 7 flour mills. Capital, New Albany. V. A N. E. county of Iowa, intersected by Red Cedar and Shell rivers; area, 550 sq. m.; pop. in 1870, 10,768. The Burlington, Cedar Rapids, and Minnesota, and the McGregor and Missouri River railroads pass through it. The chief productions in 1870 were 565,990 bushels of wheat, 310,119 of Indian corn, 29,389 of oats, 43,606 of potatoes, 18,517 tons of hay, 281,716 lbs. of butter, and 24,968 of wool. There were 4,026 horses, 3,473 milk cows, 5,888 other cattle, 3,344 sheep, and 6,280 swine; 4 flour mills, 8 saw mills, and 2 manufactories of agricultural implements. Capital, Charles City.

FLOYD, John Buchanan, an American statesman, born in Montgomery (now Pulaski) co., Va., in 1805, died at Abingdon, Va., Aug. 26, 1869. He was a son of Governor John Floyd. He graduated at South Carolina college in 1826, was admitted to the bar in 1828, and in 1836 removed to Helena, Ark., where he practised for three years. In 1839 he settled in Washington co., Va., and in 1847—'9 held a seat in the lower house of the state legislature. In December, 1849, the general assembly chose him governor of the state for the term ending Jan. 1, 1858. In 1855 he was again elected to the legislature. In 1856 he was chosen a pre-
ecedent elector, and voted for James Buchanan, 
for whose nomination he had exerted himself 
at the democratic national convention, and in 
whose favor during the canvass he had made 
many speeches in different parts of the country. 
In March, 1857, he was appointed by President 
Buchanan secretary of war. When Major An-
derson moved his garrison from Fort Moultrie 
to Fort Sumter, Dec. 26, 1860, and President 
Buchanan refused to withdraw the United 
States troops from Charleston harbor, Floyd 
resigned and retired from Washington. During 
the latter part of his administration of the war 
department he had dispersed the army to re-
move parts of the country, and transferred 
118,000 muskets and many cannon from north-
ern to southern arsenals. He was indicted by 
the grand jury of the District of Columbia as 
being privy to the abstraction of $370,000 in 
bonds from the department of the interior, in 
the winter of 1860, but failed to appear for 
trial. Soon after the beginning of the civil war 
he was made a brigadier general in the con-
federate army, and commanded with Generals 
 Wise and Henningens in Western Virginia. On 
Sept. 10, 1861, he was defeated and driven 
from Gunley bridge by Gen. Cox, with the loss of 
baggage, ammunition, and camp equipage. He 
commanded a brigade at Fort Donelson when it 
was besieged by Gen. Grant, and the night 
before the surrender, Feb. 16, 1862, he, with 
Gen. Pillow and about 8,000 men of the garri-
sion, escaped into Tennessee. For this retreat 
he was officially censured by the confederate 
government. He never again held a command.

FLOYD, William, an American general, and 
one of the signers of the Declaration of Inde-
pendence, born in Suffolk co., N. Y., Dec. 17, 
1754, died in Western, Onseida co., Aug. 4, 
1831. He was the son of an opulent land 
owner, whose ancestors had emigrated from 
Wales and settled on Long Island. On the 
outbreak of the differences between Great 
Britain and her American colonies, Floyd ar-
dently espoused the cause of the latter, and 
was appointed to the command of Suffolk 
county, and a delegate to the first continental 
congress in Philadelphia. During his absence 
the British assembled a naval force in Gardi-
ner's bay, with the intention of invading Long 
Island and levyng contributions; but Gen. 
Floyd returned, assembled the Suffolk militia, 
and displayed so much energy and daring that 
the enemy abandoned their enterprise. He 
was reflected a delegate to the general colo-
nial congress, and continued a member by 
successive elections for eight years. In 1777 
he was chosen a senator of the state of New 
York, retaining his seat in congress. He was 
a member of the first congress under the con-
stitution, afterwards a senator, and in 1801 was 
one of the presidential electors in 1801, giving 
his vote to Mr. Jefferson. In the same year 
he was chosen a member of the convention to 
revise the constitution of New York, and was 
afterward twice presidential elector.

FLOYD, Gustav Lehrekt, a German orientalist, 
born in Bautzen, Feb. 18, 1803. He studied 
philology, and especially the oriental languages, 
at Leipsic, Vienna, and Paris, and in 1833 
attained a professorship at Meissen, which 
he held till 1850, when he resigned it on 
account of his feeble health. His most 
important work is an edition of Hadji Khalia's 
bibliographic and encyclopedic lexicon in Ara-
bic, with a Latin translation and commentary, 
published at Leipsic and London, at the ex-
 pense of the oriental translation fund (7 vols., 
1836–'39). In 1854 he published an edition 
of the Koran, and in 1842 Concordantiae Corani 
Arabici. His recent works are Mani und 
seine Lehre (1892), and Die arabiscnen, türki-
schen und persischen Handschriften (1895–7).

FLUGEL, Johann Gottfried, a German lexicog-
rapher, born at Barby, near Magdeburg, Nov. 
23, 1788, died in Leipsic, June 24, 1855. He 
was employed as a merchant's clerk till 1810, 
when he went to the United States. He re-
turned to Germany in 1819, and was professor 
of the English language at the university of 
Leipsic from 1824 to 1888, when he was ap-
pointed United States consul in Leipsic. He 
is the author of Triglotte, oder konfessionelles 
Wörterbuch in drei Sprachen (German, Eng-
lish, and French, 2d ed., 1854), Praktisches 
Handbuch der englischen Handels correspondens 
(6th ed., 1883), and other writings. His "Com-
plete Dictionary of the English and German, 
and German and English Languages" has 
passed through several editions, and is exten-
sively used in Germany, England, and the 
United States.

FLUORESCENCE, a peculiar appearance ex-
hibited by certain bodies, either solid or in 
solution, which is due to a change of refrangi-
bility in the rays of light. Sir David Brew-
er in 1802, having thrown a beam of sunlight 
concentrated by a lens through an alcoholic 
solution of chlorophyl in a transparent vessel, 
found that while the emergent beam was, as 
should be expected, of the color of the solu-
tion—a fine emerald green—the path of the 
beam through the liquid was marked to a cer-
tain depth by a bright blood-red light, emitted 
in all directions. Supposing this effect due to 
a reflection of part of the admitted light by 
minute solid particles suspended in the 
liquid, he termed the phenomenon one of in-
ternal dispersion. He discovered similar re-
results in fluor spar and some other media; the 
new colors, however, not being always the 
same. In 1845 Sir John Herschel found that a 
weak solution of bisulphate of quinine, about 
1 part of the salt to 200 of water, acidulated 
by addition of a little sulphuric acid, when 
viewed by transmitted solar light, appeared 
colorless; but that, as the same light, emitted 
from a thin stratum at the surface at which 
the beam entered a beautiful sky-blue light, 
which in various other directions was seen 
as if emanating from the liquid. Beyond 
the thin stratum thus seen, the peculiar blue rays
no longer marked the course of the beam, nor did they appear in a second or third medium of the same kind into which the beam was successively passed; whereas it was evident that at a certain depth the beam had lost the power of exciting them. Herschel therefore proposed for the phenomenon the name of epipelic (surface) dispersion. The character of the change was not understood until in 1852 Prof. Stokes submitted the subject to a more careful investigation. He reasoned that the facts observed by Brewster and Herschel were the same, the rays which produced the red dispersed light possessing the power of penetrating to a greater depth before being exhausted than did those producing the blue. The latter he found to be exhausted within a film about \( \frac{1}{4} \) of an inch thick, but the blue light to which they gave rise traversed the liquid with perfect freedom; hence there must be a difference of nature between the producing and the produced rays. Such differences could probably only be explained by polarization or change of refrangibility; but the supposition of polarization was found untenable, and the case was not one of phosphorescence. In order to test the remaining hypothesis, Stokes obtained a pure luminous spectrum by means of an achromatic lens and two or more flint-glass prisms, and in place of receiving the colors on a screen held the quinine solution in these successively. In the less refrangible colors no effect was observed; but about the middle of the violet space the blue diffused light made its appearance at the entering surface, as if the liquid medium had there become self-luminous. This result appeared in all parts of the upper violet, and until the tube had been carried to some distance into the ordinarily dark space beyond, occupied by the chemical rays. The depth of the stratum thus luminous at first exceeded the thickness of the vessel used, but it rapidly diminished in the upper parts of the space to a minute fraction of an inch. The blue light, turned aside and again dispersed by a prism held obliquely in its course, yielded in some degree rays having various refrangibilities, with color corresponding, the higher colors being most abundant. By other experiments, also, the blue dispersed light was separated from the inducing violet rays; and it was found that the former always corresponded to a band of colors below the place of the latter. The light thus acted on, then, had its refrangibility always lowered. Thus the remarkable conclusion was arrived at, that by passing light through particular media certain rays belonging to the violet space have their refrangibility, and of course their color, let down in the scale, while portions of the invisible chemical rays in like manner become let down so as to fall within the range of visibility, and to appear as colored light. In the undulatory theory, these results are explicable only by an increase of the wave length and time of vibration, with a consequent diminution of the velocity of the rays thus affected. The case is one of degradation of light: in the chlorophyl solution there is a fall from blue to violet to red; in the quinine solution, from invisible or violet to a mixture whose predominant hue is blue; in canary glass, colored yellow by oxide or salts of uranium, from invisible or violet to green. The striking feature in these results is the conversion of the unseen ray power, which ordinarily induces chemism only, as in the decomposition of carbonic acid and fixation of carbon within the green leaves of plants, and in the blackening of the photographic plate, into common light, thus proving the intimate relation, if not the identity, of the two. Stokes gave to the phenomenon the name of fluorescence, as having been seen in fluor spar; and this name, conveying no theory of the case, is preferred. It is conveniently observed by pencilling over, by candle light, a sheet of white paper with the quinine solution, by pointing with it letters on the paper; nothing unusual is observed on the paper, which is as white as before, until it is brought into some light well supplied with chemical rays, and not too brightly luminous for witnessing the effect (as into a beam in an otherwise dark room), when fluorescence appears; and when in such a room the beam is decomposed, the luminous spectrum hidden from the view, and the paper brought into the ultra-violet space (which is of itself, of course, dark), its sudden lighting up with a pale blue radiance is an effect apparently little short of the supernatural. Other fluorescent media are infusion of horse-chestnut bark, or its active principle, asculine, the infusion of seeds of \( \text{datura stramonium} \), tincture of turmeric, etc. Gas and candle light excite little or no visible fluorescence; hence these are poor in actinic rays. The flames of hydrogen and of sulphur burning in alcohol give very distinct results; hence these abound in those rays. But so rich in this respect is the light of the voltaic arc from metallic points, that it produces fluorescence through a space six or eight times the length of the luminous spectrum. It is worthy of remark, however, that the fluorescent space can be detected to any considerable distance above the violet only when the prisms employed are of quartz. Glass at once cuts down the effect within narrow limits, proving that it is highly opaque to the chemical rays, for which quartz serves as the true glass. In 1858 Mr. Robinson of Armagh found the light of the aurora borealis to produce, for its intensity, very marked fluorescence; another fact favoring the electric origin of that phenomenon.—M. Niepce the younger claimed in 1858 that he had preserved during six months the photogenic power of light, in card paper impregnated with tartaric acid or nitrate of uranium, exposed for half an hour to sunlight, and then at once sealed up in a tin tube. It is certain that at the end of this time this card, removed
in the dark, placed over sensitized or photographic paper, with a partially translucent drawing or printed sheet interposed, and left so for many hours, gives a very good negative picture on the sensitized paper, the latter being darkened through the lights and protected by the shades of the interposed figure. But it is still a question whether this effect is due to preserved light, or rather actionism, or to the effect of hydrogen gas set free from compounds in the prepared card, and acting chemically on the photographic paper. Invisible drawings in fluorescent substances, exposed to the sun and immediately or soon after applied in the dark, acted more powerfully; but interposed fluorescent bodies, as well as glass, arrested the action.—At a session of the American academy of sciences held at the Stevens institute, Hoboken, Oct. 30, 1873, President Morton of that institution related some investigations recently made upon a new body which he has discovered by means of spectrum analysis, associated with anthracene. This new body, which he has succeeded in isolating and subjecting to the action of the solar spectrum, possesses remarkable fluorescent properties. It is isomeric with anthracene, but differs from it in its chemical reacions, particularly with chlorine, bromine, and sulphuric and picric acids, requiring twice as many equivalents of the latter bodies to form a compound as anthracene does. Its action upon actinic light is unlike that of all other fluorescent bodies yet experimented upon. Its continuous spectrum is banded, and if a strong solution is placed in a bright sunlight and kept hot to maintain the solution, it undergoes a definite change and has all its bands moved upward to higher positions in the spectrum. In its first or normal condition its fluorescence produces a green light, but in its second condition it is blue. To the substance in the first condition President Morton has given the name thallene, and to the modified form the name petroleune in reference to its origin and its brightness.

**FLUORINE**, a gaseous body, regarded as an elementary substance, the chemical equivalent of which, calculated from the combination of calcium and fluorine in fluor spar, is 19. It is found in the teeth and bones of animals, in sea and some mineral waters, and in many phosphates and other minerals. On account of the great difficulty of preventing fluorine, when driven from its combination with one substance, from immediately combining with any other with which it comes in contact, it has been impossible to investigate its qualities in its isolated state, and hence the slight uncertainty as to its elementary nature. Louyet obtained it by decomposing dry fluorde of silver by means of chlorine gas in vessels of fluor spar. He found the dry gas to be insalubrrious, and in many cases analogous to those of oxygen and sulphur; it acted upon almost all metals, but attacked glass feebly or not at all. Pratt prepared it from fluoride of lead, and says that it decomposes water with intensity. Combined with hydrogen in the form of hydrofluoric acid, however, its most remarkable property is its rapidly corroding glass; and for this reason it is employed for etching. Its presence is detected in any body that contains it, by submitting this in a vessel of platinum or lead, which are but slightly affected by the acid, to the action of concentrated sulphuric acid, and placing a plate of glass across the mouth of the vessel to receive the vapors evolved on the application of a gentle heat. This is the process by which hydrofluoric or fluohydric acid is obtained from fluor spar, the metallic vessel being a retort, furnished with a crooked neck of lead, in which the vapor condenses in the water placed in the bend to receive it, and which is kept cool by being surrounded with ice. It may also be obtained by condensing the vapors without the use of water in the lead tube; in this state it is called anhydrous fluohydric acid. The hydrated acid is a colorless fluid, of specific gravity 1.06, boils at 86°, and cannot be made to congeal at any temperature. It has a strong affinity for water, its vapor rising and forming thick white fumes as it combines with the moisture in the air, until by dilution this action at last ceases. Dropped into water, a sound is produced with the fall of each drop, as if it had been red-hot iron. When diluted with water it is highly corrosive, and according to its strength may produce injury by touching the skin. A single drop of the anhydrous acid may produce acute inflammation accompanied with fever. The marks made by the gaseous acid when used for etching are fine and visible on account of their opacity, while those produced by the liquid are transparent, and must be deeply etched. The product of this action of the hydrofluoric acid upon silicious substances is the gaseous compound known as fluorosilicic acid or fluorid of silicium; and thus is a means afforded of volatilizing silica and removing it from some of its combinations, by which their analysis is facilitated.

**FLUOR SPAR**, fluoride of calcium, a mineral species consisting of fluorine 48.7 and calcium 51.3 per cent., named from the Latin *fluere*, in reference to its property of flowing when used as a flux. It is met with in cubical crystals, which easily cleave into octahedrons and tetrahedrons by removal of the solid angles. These crystals, collected in groups, their faces presenting a fine splendent lustre, and some brilliant shade of red, blue, green, or purple, constitute some of the most beautiful mineralogical specimens. They are sometimes transparent, but commonly translucent, and are brittle, breaking into splinterly and conchoidal fragments. The hardness of the mineral is 4; its specific gravity 2.14 to 2.19. Coarsely pulverized and heated in a blowpipe it decrепitates and fuses to an enamel. It is met with in veins in the metamorphic rocks, and in the limestones of formations as recent as the
coal. In the north of England it is a common
gemstone of the lead veins which are found in
the strata of the coal formation; and it is there
most conveniently applied as a flux for the re-
duction of these ores, for which it is peculiar-
ly adapted. The most famous locality of flor-
spar is at Castleton, in Derbyshire, England,
whence the name of Derbyshire spar has been
given to the mineral. It is there found in the
fissures of the limestone of deep blue and purple
colors, in specimens so large and beautiful
that they are wrought into vases, inkstands, cups,
tables, &c., which present fine colors and polish,
but which from their softness are liable to be
soon defaced. The blue color is often so in-
tense that the articles cannot be worked thin
enough to exhibit the shade; but by heating the
stone nearly red-hot, the intensity is dimin-
ished and the blue changes to amethystine.
If the heat is continued, the color disappears.
The workmen call the stone blue John. They
chip the block into a rude shape, and then heat
it, so that on applying rosin over its surface
this will fuse and penetrate slightly into the
mass, the object of which is to change the ten-
dency to cleave as the stone is afterward
worked in the lathe; and as the particles are
removed in this operation, the rosinning is oc-
casionally repeated. The manufacture is diffi-
cult, from the crystalline structure with its
fourfold cleavage causing the laminae to split
up in unexpected places. The best workmen
often fail in turning very thin hollow articles.
Flour spar is found at many localities in the
United States, and is now largely used for
practical purposes. Fine crystals, commonly
green and very large, are found in different
places in Jefferson and St. Lawrence counties,
N. Y., and at Rossie they have been used as a
flux in smelting lead ores. In Illinois, below
Shawneetown on the Ohio, it is found in large
purple crystals, with the same associations of
lead ores and coal that accompany it in the
north of England. The lead veins of the meta-
morphic rocks of New England often contain
it as one of the gangues. From fluor spar is
obtained fluorspar, which, combined with hy-
drogen in the form of hydrofluoric acid, is used
to etch glass. A variety of fluor spar has been
discovered in Germany, which on the applica-
tion of heat gives off an odor which Schönbein
attributed to a modified oxygen, called an-
tozone; the mineral is called antozonite.
FLUSHING, a village and town of Queens co.,
New York, about 8 m. N. E. of Brooklyn;
pop. of the village in 1870, 6,223; of the town,
14,850. The village is at the head of a bay of
the same name opening into Long Island sound,
and has daily communication with New York
by the Flushing and the Flushing and North
Side railroads and connecting ferries. It is
noted for its fine residence buildings, one of
which is the residence of the mayor. Flushing
is a rich business town, with a large and
numerous visitors. It is the seat of the
Flushing institute, an academy which in 1872
had 7 instructors and 104 pupils; the Flush-
ing female seminary; St. Joseph's academy
for young ladies, with 100 pupils; St. Mary's
seminary for boys; and St. Joseph's convent,
containing 113 sisters. One daily and two
weekly newspapers are published. There are
eight churches, Baptist, Congregational, Dutch
Reformed, Episcopal, Methodist (three), and
Roman Catholic. Two of the Methodist
churches are for colored people.—The town
also contains the villages of College Point
(pop. 3,653) and Whitestone (pop. 1,907).
FLUSHING (Dutch, Flissingen), a fortified
town and seaport of Holland, in the island of
Walcheren, province of Zeeland, on the N.
shore of the estuary of the W. Scheldt, 50 m. S.
W. of Rotterdam; pop. in 1867, 11,521. It is well
built, and contains several churches, schools,
and charitable institutions, an academy of
sciences founded in 1766, a school of naviga-
tion, five market places, extensive dockyards,
a town hall, a theatre, and an exchange, near
which is a statue of Admiral de Ruyter, who
was born here. The principal manufactures
are beer, soap, and oil; but the inhabitants are
chiefly engaged in commerce, and branches of
industry subsidiary thereto. The port of Flush-
ing is formed by two moles which break the
force of the sea. The town is connected with
the sea by two large and deep canals, naviga-
ble for first-class merchant ships, which enter
the town and unload at the quays close to the
warehouses. The number of vessels entering
and clearing is about 100 annually. Like Brielle
it was called a "cautionary town," having
been given to Queen Elizabeth as security for
the subsidy and soldiers sent to assist the Dutch,
under Sir Philip Sidney. The French took
possession of the town in 1795, and made it a
principal station for their fleets. In 1809 it
was bombarded and taken by the British under
Lord Chatham, but was soon after evacuated.
The new docks, completed in 1873, have made
Flushing a rival of Antwerp in maritime and
commercial activity. It is the only continen-
tal port east of the English channel which will
admit the largest ships at all seasons.
FLUTE, a wind instrument, which under dif-
ferent forms and names has been in use for
more than 4,000 years. It was familiar to the
Egyptians from a remote period, and among
the Greeks and Romans was a favorite pastora-
list instrument, employed also on sacred and festi-
ve occasions, in military bands, and at funerals.
Its present name is derived from the Latin
flute, an eel caught in the Sicilian waters,
whose side is marked with seven spots like
flute holes. The Egyptian flute was from 2 to 3
ft. long, and the performer generally sat on
the ground; while that of the Greeks and annoy-
ably did not exceed a foot in length. At Athens it
was once in great repute, but was superseded
by the lyre, the use of which did not distort
the face, while it allowed the accompaniment
of the voice. In Thebes, Sparta, and other
FLUTE

places, however, it continued a favorite. The Spartan flutists were a hereditary order, and the Spartan soldiers marched to battle to the sound of Dorian flutes and soft recorders. The Egyptians appear, from their ancient pictures and sculptures, to have blown the instrument through a lateral opening near one end, producing the modulations by means of holes on the sides; hence it differed little from the modern flute. The flute of the Greeks and Romans was probably more in the nature of the pipe, and was often composed of two perforated tubes of reed or wood, played together. Until the early part of the 18th century the instrument retained the form of the pipe, and was called the English or common flute, and sometimes the *flûte à bec*, from the resemblance of the mouthpiece to the beak of a bird. It was played in the manner of the clarinet, and had seven finger holes, but no keys. This gave place somewhat more than a century ago to the German flute, which in its most perfect form consists of a tube of hard wood or ivory about 27 in. long, separable into four joints, and having from six to twelve finger keys for semitones. It is blown through a lateral hole at one end, and has a compass of nearly three octaves, from G below the treble staff to C in altissimo. The modern flute is highly effective in an orchestra, but has fallen into some disrepute for the performance of solos, in consequence of the fussy and tasteless character of the music too frequently written for it, and which serves to extinguish the skill of the player rather than the capacity of the instrument.

—The octave flute, called also the *piccolo*, is a small shrill instrument, an octave higher than the common flute. Its piercing sounds are only effective in a large orchestra or in military bands. —The flute stop, on the organ, is a range of pipes tuned in unison with the diapason, and intended to imitate the sounds of the flute. —

One of the best German flutists of the 18th century was Quantz, the flutist of Frederick II. of Prussia; François Devienne (died in 1802) and Berbigier (born in 1781) acquired a high reputation in France; and among the great flutists of the present century in Germany were Fürstenau and his son (died respectively in 1819 and 1852), and in England Charles Nicholson, whose father had also been celebrated in the preceding century. Among celebrated flutists are the following: Theobald Böhm, flutist of the king of Bavaria, born about 1802, who invented about 1888 a new flute known as the Böhm flute, which is said to combine improvements in nearly every part of the instrument, and wrote in 1847 a treatise on recent improvements in the manufacture of flutes, which was translated into French (Paris, 1848); Joseph-Roussel, appointed in 1837 to the chair of some years professor of the conservatory there; and Louis Drouet, born in Amsterdam in 1792, who was for some time Tului's rival in Paris, and removed in 1881 to Belgium and engaged in manufacturing musical instruments.

FLY

FLUVAHAN, a central county of Virginia, bounded S. by the James river and intersected by Rappahannock river; area, 170 sq. m.; pop. in 1870, 9,876, of whom 5,097 were colored. The surface is partly level and partly broken. In parts the soil is fertile and in other places barren. The James River canal extends along the S. border. The chief productions in 1870 were 77,486 bushels of wheat, 128,448 of Indian corn, 67,247 of oats, and 894,028 lbs. of tobacco. There were 1,188 horses, 1,548 milch cows, 2,122 other cattle, 7,248 swine; marble works, and a flour mill. Capital, Palmyra.

FLUX (Lat. *fluere*, to flow), a substance used to facilitate the fusion of minerals, and frequently their decomposition. A great variety of materials serve this purpose, and one or another is used according to the nature of the body to be treated, and the chemical action desired. Some by their ready fusibility induce the same condition in bodies in contact with them which are difficult to melt; others, though they may be as insubstantial as the compounds they are brought in contact with, possess affinities which possess affinities for some of those in the body to be acted upon, and fusion then takes place, with mutual decomposition and recombination of elements. Thus in treating the common silicious ores of iron, which are extremely difficult to melt, limestone, still more insubstantial, is employed, and the lime uniting with the silica enters at once into fusion, while the oxide of iron, freed from its original combination, is at the same time decomposed by the carbon of the fuel combining with its oxygen, and the iron flows free. The carbon itself may be regarded also as a flux, its action being to facilitate this process in the same manner as the limestone does. Should the iron ores be calcareous, the mineral flux to aid their decomposition must be silicious, that the same fusible silicates may be produced. Borax is a flux of very general application, from the readiness with which it forms fusible compounds with silica and other bases. The subject will be considered, as to the application of particular fluxes, in describing the metallurgical treatment of the ores of the various metals. (See also BLACK FLUX, and BOHAX.)

FLUXIONS. See CALCULUS.

FLY, the popular name of the *diptera*, or two-winged insects, of which a familiar example is the common house fly. They have a sucking proboscis, two veined and membranous wings, and two poisers behind the wings; they undergo a complete transformation. The characters of the order have been sufficiently detailed in the article DIPTERA, and therefore only some of the most common flies of the family muscidae will be noticed here. The house fly (muscus domestica) is common in Europe and North America and is considered distinct from the American species by Dr. Harris, who calls the latter *M. harpyia*; it begins to appear in houses in July, sometimes a little earlier, becomes very abundant toward the end of August, and does not disappear until
FLY

killed by cold weather; the eggs are deposited in dung, in which the fleshy larvae undergo their transformations; consequently this species is most numerous in the vicinity of stables and unclean places. The swarms of summer are doubtless the progeny of a few individuals which have survived the winter in some protected nook, and are not produced from eggs laid the preceding season; it is possible that a few may pass the winter in the pupa state, and be developed by the warmth of spring. Among the thousands of domestic flies, all are of the same size, those larger or smaller being of different species, and neither very old nor very young individuals of the *M. domestica*. The house fly is such a constant companion of man, that its presence in a coral or other island is sufficient evidence that human inhabitants are not or have not been far distant. Its two compound eyes contain 4,000 facets, each the cornea of a separate ocellus; the spiracles through which air enters the trachea are provided with a kind of sieve formed by minute interlaced fibres, which prevent the introduction of dust and foreign substances. The hard parts of the proboscis are undeveloped, in their place being a fleshy tongue-like organ, or labium, bent underneath the head when at rest. Its snout-like end may be extended into two flat, broad, fan-shaped muscular leaves, by whose sucker-like surface the fly laps up liquid sweets, as sugar dissolved by its own saliva. The leaves are supported on a framework of trachea, which end in projecting hairs, acting as a raps on delicate surfaces, and causing a tingling on the naked skin of man. It is well known that flies, like many other insects, have the power of creeping up smooth perpendicular surfaces, and of walking on ceilings with their backs downward. The last joint of the tarsus has two strong hooks, and a pair of membranous expansions (*pulvilli*), beset with numerous hairs, each having a minute disk at the extremity. There has been considerable difference of opinion as to the precise mode in which this apparatus enables the fly to walk, in opposition to the force of gravity. Derham, Home, Kirby, and Spence believed that the pulvilli act as suckers, a vacuum being formed beneath, and that the insect is held up by the pressure of the atmosphere against their upper surface; others have maintained that the adhesion is due to a viscid liquid secreted from the bottom of the foot. Dr. Hooke and Mr. Blackwall assert that the soles of the feet are so closely beset with minute bristles that they cannot be brought in contact with any surface so as to produce a vacuum, and believe that the support is owing to the strictly mechanical action of these hooks. Mr. Hepworth ("Journal of Microscopical Science," vols. ii. and iii.) reconciles these apparently contradictory opinions by the conclusion that the minute disks at the end of the individual hairs act as suckers, each of them secreting a non-viscid liquid, which renders the adhesion perfect; a structure which exists on a larger scale in the feet of *dytiscus* and other beetles. Mr. White, in his "Natural History of Selborne," observes, in confirmation of the views of Derham, that toward the close of the year, when flies crowd the windows in a sluggish and torpid condition, they are hardly able to lift their legs, and many are actually glued to the glass, and there die from inability to overcome the pressure of the atmosphere. It is well known that some lizards possess a similar faculty, and a similar apparatus to account for it. A dish of strong green tea, well sweetened, will be eagerly tasted by flies, and prove a certain poison; according to Mr. Spence, a netting of large meshes stretched across a window of a room lighted only on one side will not be passed by flies. The blue-bottle or blow fly (*M. fallipora comitaria, Linn.*) is a large, buzzing species, blue-black, with a broad, steel-blue, hairy hind body; it is found in summer about slaughter houses and all places where meats are kept, which it frequents for the purpose of depositing its eggs on animal substances. The eggs, usually called fly blows, are hatched in two or three hours; the larvae increase so rapidly in three or four days, and are so voracious, that Linneus did not greatly exaggerate when he said that the larvae of three females of this species will devour the carcass of a horse as quickly as would a lion; they pass the pupa state in the ground or in some crevice, the larval skin not being cast off, but changed into an egg-shaped case; from this they emerge as flies in a few days, or, if hatched late in the season, remain unemerged through the winter. A smaller, brilliant, blue-green fly, with black legs, much resembling the *M. lucilia Caesar* of Europe, lays its eggs on meat and the carcasses of animals.—The flesh fly (*sarcophaga carnaria, Meig.), somewhat
larger than the blow fly, is ovo-viviparous; it drops the living larvae on dead and decaying animal matter, and these active little scavengers sometimes at once their work of purification. A single female will produce about 20,000 young, which have been ascertained by Redi to increase in weight nearly 200-fold in 24 hours; Réaumur found the assemblage of embryo flies in this insect to be coined like a watch spring, about 2½ in. long when unrolled; the larvae arrive at maturity in succession, and the mother as usual dies soon after the brood is hatched. This European species is black, with lighter stripes on the shoulders, and grayish black abdomen checkered with lighter squares. Another species of Europe is the S. malmgren (Linn.), five or six lines long, with a golden head, grayish black thorax, steel-blue abdomen, and white wing scales. Both of these sometimes deposit their young on wounds and ill-conditioned ulcers of the living human body. The largest American species is the S. georgia (Wiedemann), the females of which are about half an inch long; the face is silvery white, with a black spot between the copper-colored eyes; the thorax light gray, with seven black stripes; the hind body, conical and satiny, is checkered with black and white; they appear about the end of June, and continue till after the middle of August. In this genus the bristles on the antennae are plumose. The dung fly (Scatophaga stercoraria, Meig.), of a yellowish olive color, deposits its eggs in soft dung; at the upper end they have two divergent processes which prevent their sinking too far into the nidus. The S. furcata (Harris) of the United States has the same habits, and has been erroneously charged with producing the potato rot, simply because the larvae are found upon the stalks of this plant, developed from eggs laid in the surrounding manure. The males are yellow, with hairy body and legs, and long narrow wings, and are about half as large as a honey bee; the females are smaller, less hairy, and olive-colored; both young and adult insects live upon dung, and do not injure plants. The stable fly (Stomorpha celebris, Meig.) is a well known tormentor of animals and man, whose skin it perforates by a painful bite in sultry weather and just before rains; it resembles very closely the house fly, except that the antennae are feathered, the proboscis very long and slender, and the size smaller; it attacks the legs, piercing through thick stockings and the thickest hair, returning to the attack as soon as driven away; it is solitary, not social like the house fly, and seldom enters houses unless driven in by bad weather; it is most abundant in August and September, when it is a great pest to horses and cattle; it is about one third of an inch long, and lays its eggs in dung, in which the young are hatched and undergo their transformations. The cheese fly (Piophila casei, Fallen.) is only 1⁄8 of an inch long, shining black, with transparent wings and yellowish hind legs. By its long ovipositor it penetrates the cracks of cheese, and deposits about 250 eggs, which are developed in a few days into maggots or skippers; these larvae have two horned hooked mandibles, which they use for digging into the cheese, and for locomotion instead of feet. This larva leaps 20 or 30 times its own length, first erecting itself on the tail, then bending into a circle and seizing the skin near the tail with its hooked jaws, and finally projecting itself forward by suddenly throwing itself into a straight line. The droppings and decay caused by these larvae give a flavor to old cheese which is much relished by epicures. The wine fly, living in old casks and bottles, is also a piophila. There are several species of flower flies, of the genus anthomyia, of small size and feeble flight, which sport in the air in swarms like gnats, and which in the larva state are very injurious to vegetation; some of these maggots are like those of common flies, others are fringed on the sides with hair. The A. ceparum (Meig.), of an ash-gray color, with black dorsal stripes, and about half the size of the house fly, lays its eggs on the leaves of the onion close to the earth; its smooth white larvae bore into the bulb, and entirely destroy it. The A. brasicus and A. lactucae are equally destructive to the cabbage and lettuce; the A.
**FLYCATCHER**

*rapahani* (Harrisi) attacks in the same way the radialis. The *A. scalaris* and *canicularis* give rise to fringed maggots, which have been not uncommonly ejected from the human body, having probably been swallowed with vegetables in which decay had commenced; as the eggs in many instances belong to species depositing in the orifice of privies, the larva might remain alive for a considerable period in the intestines of man; eggs of other *muscida* might be introduced on meats, fruits, salads, vegetables, and in impure water. In the Transactions of the entomological society of London (vol. ii., 1837), Mr. Hope gives a tabular account of 37 cases in which maggots of the *muscida* infested the human body, many of which were recognized as belonging to *M. domestica*, *C. vomitoria*, and *S. carnaria*; and many cases have since been recorded in medical journals.

**FLYCATCHER**, the popular name of many dentistreous or tooth-billed birds, of the order *passeres* and subfamily *musciopinae*. They have bills of various lengths, generally broad and flattened at the base, with the culmen curved and the sides compressed to the emarginated tip; the gape is furnished with long and strong bristles, for the easier securing of their flying prey; the wings are usually long, as also is the tail; the tarsi short and weak; the toes long, the outer generally united at the base. The subfamily *musciopinae* includes the following genera: *conophaga* ( Vieill.), with 7 species, found in the thick woods of tropical America; *platyphrynchus* (Desm.), with about 20 species, in the brushwood and trees of tropical America; *platyscelus* (Jard. and Selby), African, with a dozen species; *tadirostrum* (Lesson), with 15 species, South American; *muscinora* (Cuv.), 3 species, South American; *raipidura* (Vig. and Horst.), 40 species, found in India and its archipelago, New Zealand, and Australia; *tchitreia* (Less.), 20 species, in Africa, India, and its archipelago; *monarcha* (Vig. and Horst.), 10 species, in Australia and the islands of the Indian ocean; *sesura* (Vig. and Horst.), 3 Australian species; *myiasarga* Vig. and Horst.), 14 species, in Australia and India; *hemichiledon* (Hodgs.), 2 species, in the hills of Nepal; *nittava* (Hodgs.), 20 species, in India and its archipelago; *musciaca* (Linn.), with 70 species, in most parts of the old continent; and *setophaga* (Swains.), nearly 20 species, in North and South America. The last is a very active genus, pursuing swarms of flies from the top to the bottom of a tree in a zigzag but nearly perpendicular direction, the clicking of the bills being distinctly heard as they snap up the insects in the course of a few seconds; the American redstart (*S. rutilica*, Swains.), placed in the family *sylvicolidae* by Prof. Baird (in his Pacific railroad report), is a good example of the genus.—There is probably no family of birds about which systematic writers on ornithology differ more than on that of the flycatchers. Prof. Baird follows Burmister in adopting the order *insecteae*, and Cabanis in placing most of them in the suborder *clamatorius*: he calls the whole family *coleopteridae*, of which the subfamily *tyrannina* is what chiefly interests us here. The fork-tailed and swallow-tailed flycatchers belong to the genus *miliarius* (Swains.); the Arkansas, Cassin's, and Couch's flycatchers to the genus *tyrannus* (Cuv.); the great crested, Mexican, Cooper's, and Lawrence's, to the genus *myiarchus* (Cab.); the black, pewee, and Say's, to the genus *sayornis* (Bonap.); the olive-sided to the genus *contopus* (Cab.); Traill's, the least, the small green-crested, and the yellow-bellied, to the genus *empidonax* (Cab.); the last four genera are included in the genus *myiobius* of Gray. The Canada and Bonaparte's flycatchers are warblers, belonging to the genus *myiodes* (Aud.) or *setophaga* (Swains.); the solitary, white-eyed, warbling, yellow-throated, red-eyed, Hobe's, and the black-throated flycatchers are vireos; the blue-gray flycatcher belongs to the family of titmice, and to the genus *poiceptila* (Scelater). The flycatchers are active and fearless, and very beneficial to man by destroying flies, moths, and various insects and grubs injurious to vegetation and to animals.

**FLYING FISH** *eovacetus* (Linn.), a genus of fishes belonging to the order *pharyngeophagi* and the family *pharyngeocytae* (Miller), containing, according to Valenciennes, 38 species. This genus is at once recognizable by its large pectoral fins, capable of being used as parachutes, and to a certain extent as wings; other fishes have the faculty of leaping out of the water and of sustaining themselves in the air for a short time, but the *eovaceti* far excel these, and approach much nearer in this act the true flight of birds than does the flying dragon or the flying squirrel. Navigators in all tropical seas are familiar with these sprightly fishes, which relieve the monotony of ocean life as birds do the silence of the woods. The characters of the long pectorals, the strength of the muscles which move them, and the size of the bony arch to which they are attached, are the essential conditions of their flight. Numerous observations prove that these slimy bands pursue their flights when no danger threatens, in the full enjoyment of happiness and security, for rare sport, and probably as a necessity of their structure. Their lot indeed would be far from enviable were their flights the frantic attempts to escape from pursuing bonitos and dolphins (*coryphaena*), for in the air their danger is quite as great from the albatross, frigate pelicans, petrels, and other ocean birds. This habit belongs to the same class of phenomena as the flying of the dragon and squirrel, the climbing of trees by the anabas, and the traveling across the land by the common eel. Humboldt drew attention to the great muscular force necessary for the flight of these fishes; he recognized that the nerves supplying the pectorals are three times as large as those going to the ventrals; the muscular power is sufficient to
FLYING FISH

raise them 15 or 20 ft. above the surface, and to sustain them with a velocity greater than that of the fastest ship for a distance of several hundred feet. The pectorals strike the air with rapid impulses, scarcely more perceptible than the quick vibrations of the humming bird's wing. Humboldt says they move in a right line, in a direction opposite to that of the waves, but other observers assert positively that they can turn nearly to a right angle from this course before settling into the water again; though they generally come out on the top of a wave, they can pass over several of their summits before descending. The size of the swimming bladder is enormous, occupying more than half the length of the body; though this, not communicating with the intestine, is of no advantage in making the exit from the water, it contributes to prolong the flight by rendering the body more buoyant. The flying faculty of these fishes, the pleasing spectacle of their troops sporting around the bows of vessels, the glittering of their beautiful colors in the tropical sun, the delicate flavor of their flesh, and the fact of their frequently leaping on board ships, have attracted the attention of mariners from early times; but until a comparatively recent period only two species were admitted by naturalists, who gave them a distribution as wide as the tropical and temperate seas. The order to which the flying fish belongs is characterized by having the lower pharyngeal bones united to form a single bone. The generic characters of _exocoetus_ are: a head and body covered with scales, with a scaly keel on each flank; the pectoral fins nearly as long as the body; the dorsal over the anal; the head flattened, with large eyes; both jaws with small pointed teeth, and the pharyngeals with numerous compressed ones; upper lobe of the tail smaller than the lower; the fins without spines; the intestine straight, without pyloric ceca. — The common flying fish of the Mediterranean (_E. solitans_, Linn.) is recognized by its long white ventral fins; the body is generally short and thick, robust in the pectoral region, rounded above, flattened on the sides; the head is large, the muzzle obtuse, the lower jaw the longer, the mouth small, the teeth in the anterior part of the jaw, the palate smooth, the tongue free, the gill openings large, and the branchial rays 10 to 12; the humeral bones are large and firmly articulated to the head, and the pectorals, which are attached to them, are so arranged that when the flexors contract the fins are spread horizontally, and are applied along the sides when the wings are shut; the movements do not differ from those of other fishes except in the freedom permitted by the articulation; the fin rays are very long, and not deeply divided; the ventrals, inserted in front of the middle of the body, are completely abdominal and well developed; the dorsal is small, low, and triangular; the anal very short, and the caudal deeply forked; the swimming bladder extends along the spine even under the last caudal vertebra, protected by their lower bony arches, a disposition found in no other fish. The general color is a leaden gray, with greenish tints on the upper half of the body, and silvery white below; the pectorals have a wide whitish border; the dorsal is gray, the caudal brown, the anal bluish, and the ventrals whitish. The largest specimens are rarely more than 16 in. long, and they are found in all parts of the Mediterranean. The _E. solitans_ (Linn.) is found in so many parts of the world, that it may be called cosmopolitan. The average length is between 8 and 9 in.; the eyes are of moderate size, the teeth very small, the dorsal and anal fins long and low, the pectorals extending to the caudal, the ventrals very short and attached to the anterior third of the body; the color is rich ultramarine blue on the back, and silvery on the abdomen; the fins are of a darker blue, the pectorals being unsplotched. There are five species on the coast of North America, which have been divided into three genera by Dr. Weinland. The common species (_E. solitans_, Gmel.), found from the gulf of Mexico to the coast of New Jersey, is from 12 to 16 in. long, with dusky pectorals and ventrals, banded with brown in young specimens; the ventrals are longer than the anal, and nearer the vent; the dorsal and lower lobe of the caudal are spotted with brown and black. The New York flying fish (_E. Noveboracensis_, Mitch.), about a foot long, has been found from the middle states to Newfoundland; the color above is dark green, the pectorals brown with the end bordered with white; the ventrals are very long, nearest to the vent, and the wings reach to the tail. — Some species have the lower lip much developed, with one or two tough appendages hanging from the chin; these have been separated as the genus _cyprinus_, and include two species of our coast. The _C. co- catus_ (Mitch.) has a black circle, and extending half the length of the body, which is about 5 in.; the pectorals do not extend to the end of the ventrals, the latter touching the caudal; it has been found from New York to the southern states. The _C. furcatus_
FLYING LEMUR

(Mitch.) has two appendages from the lower jaw; it is 3 to 5 in. long, and extends from New York to the gulf of Mexico; the pectorals are large, and the ventrals very long. The middling flying fish Dr. Weinland has made the type of a new genus halocycalus; this species (H. mesogaster, Weinland) is found in the West Indies, varying in length from 4 to 7 in.; the ventrals are very short, about one quarter as long as the pectorals, anterior to the middle of the body, between the anus and the pectorals; the lower jaw is angular.—The flying gurnard (dactylopterus solitans, Cuv.), a spiny fish of the family triglidae or aulichthyes, has also been called flying fish by navigators. The species has been described as occurring in the Mediterranean, in the tropical seas, in the West Indies, and the gulf of Mexico, and along the American coast from Newfoundland southward; probably more than one species will be found over such an extended range. These flying fish or sea swallows behave very much like the exocoeti, swimming in immense shoals, leaping out of the water for sport and for safety, preyed upon by marine and aerial enemies, and falling in consequence into equally cruel hands on board vessels which come within their range. From the rapid drying of their pectorals and their less muscular power, they fall into the water again sooner than do the true flying fish; their pectorals serve merely as parachutes. They vary from 6 to 8 in. in length.

FLYING LEMUR, Colugo, or Cat Monkey, the common name of animals of the family galeopithiades, elevated into the order pteropiera or dermoptera by some authors; they evidently constitute the connecting link between the monkeys and the bats. In the single genus galeopithecus (Pall.) the dental formula, according to Owen, is: incisors 2-2, canines 1-1, premolars 3-3, and molars 3-3; the feet are all five-toed, without opposable thumbs, united by a small membrane, armed with claws, and adapted for climbing. The body is surrounded by a hairy lateral membrane, extending from the sides of the neck to the base of the feet, embracing the wrists, and continued between the legs, involving the tail as in many bats; this membrane, like that of the flying squirrel, serves as a parachute to sustain the animal in its astonishing leaps from tree to tree. The edges of the lower incisors are serrated like the teeth of a comb; the eyes large and prominent, the ears moderate; there are two pairs of pectoral mamme. They are nocturnal animals, passing the day suspended from trees by the hind claws like bats; they are very active at night, climbing with facility, and springing from tree to tree for a distance of 100 yards; the females carry the young in the fold of abdominal integument, when travelling among the trees; their food consists principally of fruits, insects, small birds, and eggs; their movements on the ground are rather awkward. The largest species (G. variegatus, Geoffr.) is about the size of a cat, but slimmer; the color varies from light gray to russet, spotted and striped with black and light colors. All the species live in the East Indian archipelago. Though emitting a disagreeable odor, the flesh is considered palatable by the natives.

FLYING SQUIRREL (pteromys, Cuv.; Gr. πτερόμυς, wing, and μυς, mouse), a genus of the family sciuridae, differing from common squirrels principally in the expansion of the skin between the fore and hind feet, by means of which the animal sails in a descending line from one tree to another, supported as by a parachute. There are two subdivisions of the genus: pteromys, with rounded tail and complicated molar teeth; and sciuropterus (F. Cuv.), with flattened tail and molars simple as in other squirrels. The species of the United States and the single one found in Europe belong to the last subclass. The dentition and general appearance are like those of squirrels; the head and ears are round, and the eyes large; there are four elongated teeth with sharp claws and the rudiment of a thumb, on the fore feet; five long toes, fitted for climbing on the hind feet; the sailling membrane is attached in front to a slender movable bone about an inch long, extending at a right angle from the hand; the membrane is hairy on both sides. The common flying squirrel (P. or S. volucella,
FLYING SQUIRREL

Pallas) is about 10 in. long, of which one half is the tail; the color above is light yellowish brown, the tail being rather smoke-colored, and white beneath; the fur, as in all the species, is very soft and fine. It is a nocturnal animal, rarely appearing until sunset, at which time its gambols and graceful flights may be often seen in places frequented by it; the large eyes indicate its habits, which make it rather an uninteresting pet, as it is lively only at night; it is harmless and gentle, and soon becomes tame, eating the usual food of squirrels. There is nothing resembling the act of flying in its movements, as we see in the flying fish; it sails from a high to a lower point, a distance of 40 or 50 yards, and when it wishes to alight the impetus of its course enables it to ascend in a curved line to about one third of the height from which it descended; running quickly to the top of the tree, it redescends in a similar manner, and will thus travel a quarter of a mile in the woods in a few minutes without touching the earth. Flying squirrels are gregarious, six or seven being found in a nest, and considerable numbers in the same hollow or artificial cavity, associating with bats and other nocturnal animals; the food consists of nuts and seeds, buds, and even meat and young birds. They produce from three to six young at a time, and have two litters in the southern states, in May and September. This species extends from Upper Canada and northern New York to the extreme southern limits of the United States, east of the Mississippi. The northern flying squirrel (P. or S. Hudsonius, Gmel.), found from Maine to Minnesota and to the north, is considerably larger; the length of the head and body is 8 in. and the tail 5/2; the color above is yellowish brown, mixed with cinereous, the hair lead-colored at the root, beneath white. It is common in Lower Canada; in the Lake Superior copper region, in the new and remote mining locations, where rats and mice have not yet penetrated, this species lives familiarly in the walls of the log cabins, coming out at night in quest of food, and sometimes committing sad havoc among the miner’s scanty stores. Other American species are the P. or S. alpinus (Rich.), from the Rocky mountains, resembling the last, but a little larger, and the membrane having a straight border; and the P. or S. Oregonensis (Bach.), in Oregon and California, about the size of the northern species, with a very broad membrane.—The European species (P. or S. colans, Linn.), found in Siberia, Poland, and Russia proper, is a little larger than the S. velutina, whitish gray or cinereous above, and white below; it lives wholly on trees, eating the tender shoots of resinous and other trees. The species of pteromys inhabiting India and its archipelago attain a larger size than any of the preceding. The taguan (P. petursitra, Fall.) is as large as a half-grown cat; the male is bright chestnut above, and red beneath; the female brown above, whitish below. There are several species in Java, of which the best known are the P. genibarbis (Horsf.) and P. sagitta (Penn.). The former is remarkable for the radiated disposition of long slender bristles on the sides of the head; though living in a hot climate, the fur is thick and downy; the general color is gray above, with a tawny tint on the back, and white beneath; it is about as large as the common red squirrel. The second species, like the first, is rare, and lives principally on fruits; the color is brown above and white below. Several other species are described.

FOERSTER, Wilhelm, a German astronomer, born at Grünberg, Silesia, Dec. 16, 1832. He studied in Berlin and in Bonn, where he graduated in 1854. He became second assistant at the Berlin observatory in 1855, first assistant in 1860, professor in 1863, and director of the observatory in March, 1865. He is prominently connected with the most important astronomical periodicals, and secretary of the astronomical society, and since the close of 1888 has been at the head of the commission for establishing German weights and measures upon a metrical basis.

FOETUS. See Embryology.

FOG, a body of aqueous vapor in the atmosphere, like the clouds seen in the sky above, but distinguished from them both by its position and by the manner of its formation. A large class of clouds result from the diminution of temperature produced by the elevation and expansion of moist air, and a small class is due rather to the cooling of the air by radiation in a horizontal direction to bodies of cooler air; while again a very important class arise from the radiation of heat vertically into the cold interstellar regions. To these simple causes also must be attributed the formation of a large class of fogs. On the other hand, the peculiar feature in the origin of a number, and especially of the heaviest
fogs that occur, consists in this, that the moist air radiates its heat downward to a comparatively cold body of either water, earth, or air. The former case occurs when the earth, after a period of low temperature, becomes quite cold, and the winds then waft warm moist air over the cold regions, while the small conducting power of the earth, ice, or snow does not allow its surface at once to follow the change in temperature. Fogs of the second class occur only during very clear nights; the radiation from the earth then takes place with great freedom, and the moist air by this means coming into contact with the cold earth becomes greatly reduced in temperature, and after depositing a heavy dew lies still in the valleys over the whole surface of the ground. To this body of cold air the superincumbent atmosphere radiates heat as freely as to the outer regions of the air, and even more rapidly because of its thinness. When by this process the temperature is reduced to the dew point, the aqueous vapor begins to condense as fog, the particles of which attach themselves to neighboring solid bodies, such as leaves and branches of trees, but in a manner slightly different from the formation of dew. The third class of fogs, that produced by the radiation of atmospheric heat to a body of cold water, may occur in two ways: either warm air may be wafted over bodies of cold water, or currents of cold water may under-run bodies of warm moist air. The fogs on the coasts of New England, Nova Scotia, and Newfoundland, and those of the Gulf stream, belong in great measure to the former class, as the motion of the cold ocean currents must be considered quite slight in comparison with the rapidly moving winds. To the latter class belong fogs over rivers whose cold waters are flowing rapidly toward warmer regions. These are important features of the lower portions of the Mississippi, and have been well studied by Dr. W. M. Carpenter. (See “American Journal of Science” for 1848.)—Concerning the exact condition of the vapor when in the state that constitutes a fog, much has been written since the first announcement by Kratz- enstein of his theory of the existence of fog vesicles as distinct from rain or dew drops. Notwithstanding the labors of Kämter (1886), Meisner (1867), Mühry (1878), and others, it must be admitted that this theory is still supported by too few minutely accurate observations to allow its unqualified adoption; and it is safer to presume that the particles of a fog are maintained floating in the air simply by the resistance offered by the atmosphere to the fall of minute spherical bodies. The dry fog that constitutes a characteristic feature of the North American Indian summer is not essentially different from the moor smoke (Moor- rauch) of Europe, and has been satisfactorily traced to the burning of extensive tracts of forest and prairie land. From such fires the diluted smoke spreads with the winds over immense areas. The progress of these masses of smoke in the United States and Canada has of late years been very closely followed by the officers of the weather bureau of the army signal office, who have frequently been able to predict this phenomenon. The great fires of 1871 in the northwest, and indeed throughout the whole country, gave rise to remarkable exhibitions of this haze. An extraordinary dry fog is recorded to have covered the whole of Europe in 1786 for nearly two months.

BOULDER, Ernst Eric, a Swedish sculptor, born at Gothenburg about 1787, died in Trieste, Dec. 21, 1854. He was the son of a bronze founder, studied in Stockholm and Paris, and spent upward of 80 years in Rome, taking rank next to Thorwaldsen. The subjects of his most celebrated works are from Greek and Scandinavian mythology, many of which are in the museum and in the private galleries of Stockholm. He also made bronze statues of Gustavus Adolphus and Charles XIV. (Bernadotte).

FOGARAS, a market town of Transylvania, capital of a district of the same name, on the left bank of the Aluta, 82 m. W. N. W. of Kronstadt; pop. in 1867, 4,714. It has a strongly fortified castle, built at the beginning of the 14th century and restored in the early part of the 17th by Bethlen Gábor. Fogaras gives title to the United Greek archbishop of the Roumans in the lands of the Hungarian crown; but his residence is at Blasendorf. On July 12, 1849, Bem was defeated here by the Russian generals Engelhardt and Lüders.

FOGGI. I. Also called Captanata, a province of southern Italy, bounded N. and E. by the Adriatic, and bordering on the provinces of Bar, Potenza, Avellino, and Campobasso; area, 2,935 sq. m.; pop. in 1871, 519,164. It comprises the three districts of Bovino, Foggi, and San Severo. The Gargano peninsula forms in the southern part the gulf of Manfredonia, on which opens the vast plain of Foggia. The Gargano range extends over 800 sq. on. on the S. E. side of the province, and the branches of the main Apennines rise on the S. W. Between the barren mountainous regions are exceedingly fertile valleys. The chief rivers are the Ogano, Fortore, Candela, Cervaro, and Carapella. The vine and the olive are extensively cultivated, and among the other products are grain, tobacco, licorice, hemp, and flax. The breeding of cattle, particularly of sheep, is extensively pursued. II. A city, capital of the province, in the plain of Apulia (La Fuglia), 60 m. N. E. of Naples, connected by rail with Ancona, Naples, and Bari; pop. in 1871, 68,188. It is well built, with wide clean streets, handsome houses and gateways, but no walls. It has about 20 churches, a cathedral originally Gothic, but rebuilt in a different style after its partial destruction by an earthquake in 1781, several antiquities, a public library, and a theatre. The main streets and public squares are under-

FÖLDVÁR

301

of Navarre, his brother-in-law. On his release
he fought bravely in the ranks of the Teutonic
knights against the Prussians. Returning to
France in 1369, he contributed to the defeat
and destruction of the rebellious Jacquerie,
who were besieging the royal château at Meaux.
In 1362, by victory over the count d'Armagnac,
he secured for himself possession of Béarn;
and the magnificence of his court at Orthez
and afterward at Pau was admired by Froissart.
In 1380 he was appointed governor of Langne-
deeo by Charles V., but his dignity was contest-
ed by the duke of Berry, whom he defeated
at Revel. Gaston Phoebus was a famous hunt-
man, and left a book entitled Miroir de Phébus,
des études de la chasse des bestes sauvagees et
des cerceaux de proie (fol., Paris, 1607).—Gas-
tox IV. (died in 1472) made himself conspicuous
by services as well as hostility to both
Charles VII. and Louis XI. He married Elo-
nora, princess and afterward queen regnant of
Navarre, who died in 1479; and his niece
Catherine de Foix married Jean d'Albret in
1484, the county of Foix was henceforth united
with Navarre under that house. Her rights
to the county were, however, long disputed
by her uncle, Jean de Foix, viscount of Nar-
bonne. A son of the latter was the hero and
victim of the battle of Ravenna (April 11,
1512). (See Gaston de Foix.)

FOIX, a maritime province of China,
bounded N. by Chechiang, W. and N. W. by Ki-
angsi, S. by Kwangtung, and S. E. by the China
sea; area, 58,480 sq. m.; pop. estimated in 1842
at 26,000,000. It abounds in bays and islands,
including Amoy, Haitan, and part of Formos-
a. The Min and its tributaries are the prin-
cipal rivers. The country, though generally
mountainous, is exceedingly well cultivated.
The hills are cut in terraces, and the valleys are
beautiful and fertile, and agriculture is greatly
promoted by artificial irrigation. The products
are excellent black tea, rice, wheat, barley,
sweet potatoes, camphor, sugar, iron, indigo,
tobacco, and alum. Porcelain and cloth are
made. The chief imports are corn, drugs,
fruit, and salted meats. Capital, Foochow.

FOKSHAN, a frontier town of Roumania, 104
m. N. E. of Bucharest, divided by the river
Milkov between the provinces of Wallachia
and Moldavia, the smaller part belonging to
the latter; pop. estimated at 20,000. The best
Moldavian wine is produced in its vicinity.
A congress of Russian and Turkish diplomats
was held here in 1732. Near the town the
Russians and Austrians defeated the Turks,
July 21, 1789.

FÖLDVÁR, or Dana-Földvár (Földvár-on-the-
Danube), a town of Hungary, in the county
of Tolna, on the right bank of the Danube, 47
m. S. of Buda; pop. in 1869, 12,582. It com-
mands the communication between the upper
and lower Danube, and is a depot for salt.
The surrounding district is fertile, producing grains
and wine; and the town has a considerable
sturgeon fishery.
FOLEY, John Henry, an Irish sculptor, born in Dublin, May 24, 1818, died in London, Aug. 28, 1874. At an early age he entered the school of the royal Dublin society, and in 1834 became a student at the royal academy in London. In 1839 he first appeared as an exhibitor there, with his models of "Innocence" and the "Death of Abel." Among the most popular of his imaginative works are: "Ino and the Infant Bacchus" (1840), "Lear and Cordelia" and the "Death of Lear" (1841), "Venus rescuing Perseus" (1842), and "Prospero relating his Adventures to Miranda" (1845). For several years he was kept busy with commissions for portrait statues, producing, among many others, those of Edmund Burke and Oliver Goldsmith, for Dublin. One of his latest works was the colossal statue of Prince Albert, for the memorial in Hyde Park, of which he executed the group "Asia."

FOLIGNO (pop. 31,839; in Foligno), a walled city of central Italy, in the province and 20 m. S.E. of the city of Perugia, in a beautiful valley of the Apennines; pop., in 1872, 21,686. It is large, but poorly built, and is famous for its manufactures of silks, woollens, soap, bleached wax, and playing cards. In 1831–2 it was nearly destroyed by earthquakes. The celebrated picture of Raphael, La Madonna di Foligno, took its name from this place. A monument to the painter Alunno was erected here in 1872.

FOLKSTONE, a market town, seaport, and parish of Kent, England, built partly on the level shore and partly on a cliff on the straits of Dover, 7 m. S.W. of Dover, of which it is a sub-port, and 83 m. S.E. of London by the southeastern railway; pop. in 1871, 12,694. It was an ancient place of importance, and still has traces of Roman defences. In the 18th century it was the seat of extensive fisheries, and drew still greater wealth from various branches of the smuggling trade, on the suppression of which it fell into decay. Since the opening of the railway, however, which connects at this port with a line of steam packets for Boulogne, it has recovered its prosperity. The harbor has been improved, a fine pier has been built, a custom house established, new warehouses and hotels have been erected, and streets opened. It is said that the town formerly contained five churches, four of which were swept away by the sea; there are now two. An old castle, founded by the Saxon kings of Kent and rebuilt by the Normans, has been almost totally destroyed, together with the height on which it was erected, by the encroachment of the sea. It is much resorted to for sea bathing.

FOLLEN, August, after ward Adolp Ludwig, a German poet, born in Giessen, Hesse-Darmstadt, Jan. 21, 1794, died in Bern, Switzerland, Dec. 26, 1855. After studying philology and theology in his native town, he served in the campaign of 1814 against France. On his return he studied law for two years at Heidelberg, in 1817 began to edit the Allgemeine Zeitung at Elberfeld, in 1819 was involved in political agitations for which he was imprisoned two years in Berlin, went thence to Switzerland, and subsequently became a citizen of Zurich. In 1847 he purchased the castle of Liebenfels in Thurgau, whence in 1854 he removed to Bern. He translated the Homeric hymns (1814), and a volume of old Latin ecclesiastical hymns (Elberfeld, 1819), and published other works.

FOLLEN. L. Charles, an American clergyman, brother of the preceding, born at Romrod in Hesse-Darmstadt, Sept. 4, 1796, perished in the confederation of the steamboat Lexington in Long Island sound, on the night of Jan. 13, 1840. He was educated at Giessen, where he was distinguished for his liberal sentiments, and attached himself to the Burschenschaft, which fell under suspicion as aiming at political revolution. He wrote a defence of the Burschenschaft, which, with others by his brother August, were published at Jena in 1819. In 1818 he received his degree as doctor of civil and ecclesiastical law from the university at Giessen, where he remained for some time as a lecturer on jurisprudence. He then went to Jena to lecture at the university, and was accused of complicity in the assassination of Kotzebue. He was twice arrested, but after a rigid examination was honorably acquitted. About the same time he was arrested on a charge of being the author of the "Great Song," which was considered seditious, but no evidence was found against him, though in fact he was one of its composers. He was, however, forbidden to continue his lectures at Jena. He returned to Giessen, but learning that he was again to be put under arrest, he fled to Paris, and thence went to Switzerland, and was appointed professor of Latin and history in the cantonal school of the Grisons at Coire. His lectures having given offense by their Unitarian tendency to some of the Calvinistic ministers of the district, he asked a dismissal and obtained it, with a testimonial to his ability, learning, and worth. The university of Basel then appointed him lecturer upon law and metaphysics. While he was at Coire and Basel a demand was made by the German governments for his surrender as a revolutionist. It was twice refused, but on its renewal a third time in a threatening form, Basel yielded, and a resolution was passed for his arrest. He escaped from the city, and at the close of 1824 sailed for New York. He soon learned the English language, and in December, 1825, he received the appointment of teacher of German at Harvard college. In 1828 he was appointed teacher of ecclesiastical history and ethics in the divinity school, having in the mean time been admitted as a candidate for the ministry. In 1830 he was appointed professor of German literature at Harvard, which post he held for five years. In 1838–'9 he was pastor of the first Unitarian society in New York, and in 1839 he took charge of a church in East Lexing-
ton, Mass. In 1886 he published "Psychology," and an "Essay on Religion and the Church." He was a contributor to the "New Review," and occasionally gave courses of lectures. His sermons and lectures, and an unfinished sketch of a work on psychology, with a memoir of his life by Mrs. Follen, have been published (5 vols., Boston, 1841). II. Eliza Lee, an American authoress, wife of the preceding, and daughter of Samuel Cabot, born in Boston, Aug. 15, 1787, died at Brookline, Mass., Jan. 30, 1860. She married Dr. Follen in 1828. Her principal publications are: "Selections from Follen's", and the "Well Spent Hour." (1828); "The Skeptic." (1835); "Married Life," "Little Songs," and "Poems." (1839); "Twilight Stories." (1859); and a second series of "Little Songs." (1869).

FONBLANQUE. I. Albany Williams, an English journalist, born in 1797, died in London, Oct. 13, 1872. He was the son of an eminent lawyer, and studied for the profession, but soon became a political writer. After contributing to the "Morning Chronicle," he became editor of the "Examiner" in 1820, succeeding Leigh Hunt, and conducted it with great ability till 1846. In 1837 he published "England under Seven Administrations" (8 vols.), a collection of his contributions to the "Examiner." In 1852 he became director of the statistical department on the board of trade. His "Life and Labors," edited by his nephew, E. B. de Fonblanque, was published in 1874. II. John Samuel Martin, an English lawyer, brother of the preceding, born in London in March, 1787, died there, Nov. 8, 1885. He was educated at the Charterhouse and at Caius college, Cambridge. He obtained a commission in the army, and served in Spain, Italy, and the United States, and was taken prisoner in the battle of New Orleans, and afterwards called to the bar, and the year after was made a commissioner of bankruptcy, in which position he worked and wrote vigorously for a reform in the system. In 1823, in connection with Dr. Paris, he published a valuable treatise on "Medical Jurisprudence," and in 1836, with Sutton Thorpe and Richard Goff, he started the "Jurist," to advocate amendment of the laws.

FOND DU LAC, a S. E. county of Wisconsin, at the S. end of Lake Winnebago; area, 754 sq. m.; pop. in 1870, 46,278. It is drained by Fond du Lac river and other streams. A steep ledge of limestone, running from N. E. to S. W., divides the county into two unequal portions, the easternmost of which is heavily timbered, while the other contains extensive prairies. The soil is calcareous and generally fertile. The Wisconsin division of the Chicago and Northwestern railroad, the Sheboygan and Fond du Lac, and the Northern division of the Milwaukee and St. Paul, pass through the county. The chief productions in 1870 were 1,616,286 bushels of wheat, 287,400 of Indian corn, 878, 515 of oats, 60,735 of barley, 242,961 of potatoes, 76,027 tons of hay, 1,965,482 lbs. of butter, 274,187 of wool, and 49,825 of hops. There were 11,621 horses, 14,275 milch cows, 18,330 other cattle, 96,084 sheep, and 1,917 swine; 4 manufactories of agricultural implements, 8 of boots and shoes, 29 of carriages and wagons, 7 of cheese, 9 of clothing, 7 of furniture, 4 of iron castings, 10 of engines and boilers, 1 of linseed oil, 12 of saddlery and harness, 9 of saddles, doors, and blinds, 12 of tin, copper, and sheetiron ware, 5 of cigars, 3 planing and 18 saw mills, 4 tanneries, 2 carrying establishments, and 19 flour mills. Capital, Fond du Lac.

FOND DU LAC, a city and the capital of Fond du Lac county, Wisconsin, situated at the S. end of Lake Winnebago, 60 m. N. by W. of Milwaukee; pop. in 1860, 5,460; in 1870, 12, 764, of whom 4,029 were foreigners. It is built on ground ascending gradually from the lake, and interspersed with groves. An interesting feature of the city is the numerous artesian wells, which supply water of great purity and excellence. One of these yields magnetic water, and is noted for its curative properties. The buildings are partly of wood and partly of brick. The chief public edifices are an extensive hotel, a fine hall, a large high school building, and a fine post office building. Fond du Lac is surrounded by a rich agricultural country, and ships large quantities of hay and many horses and cattle to the Lake Superior mining region. It has communication by steamboat with Green bay and with points on the Fox and Wolf rivers, and by rail with all points through the Wisconsin division of the Chicago and Northwestern railroad and the Sheboygan and Fond du Lac railroad, and there is also an air-line road to Milwaukee. The manufactories include 16 saw mills, 2 shingle mills, 4 sash and door factories, 3 grist mills, 8 foundries, 1 manufactory of agricultural implements, 15 or 20 carriage and wagon factories, and 1 blast furnace. The car shops of the Chicago and Northwestern railroad employ about 400 men. There is a national bank with a capital of $110,000, and two savings banks having each $50,000 capital. The city is divided into five wards. In 1872 there were 47 public schools, viz., 1 high, 4 grammar, and 42 primary, having 50 teachers and an average attendance of 3,030 pupils. The total expenditure for school purposes was $92,569, of which $18,871 were for teachers' wages. There are 15 churches, and 3 daily, 1 semi-weekly (German), and 5 weekly (2 German) newspapers.

FONSECA, Elesa Pimentel de, marchioness, an Italian martyr, born in Naples in 1708, executed July 20, 1799. She belonged to an illustrious family, and was celebrated for her beauty, poetical talent, and learning. In 1784 she became the wife of the marquis Fonseca and a lady in waiting of Queen Caroline of Naples, whose favor she soon forfeited by her remarks on her majesty's intimate relations with the minister Acton. After the flight of the royal family in 1798, the marchioness was prominent as a partisan of the French, and
conspicuous by eloquent public addresses; and on the restoration of the Neapolitan monarchy in 1799 she was sentenced to death on the gallows at the instigation of Queen Caroline, upon the ground of her having contributed to the anti-royalist Monitore Napoletano. Her execution became the signal of wholesale massacres and imprisonments.

**FONTAINE, Jean de la.** See La Fontaine.

**FONTAINEBLEAU,** a town of France, in the department of Seine-et-Marne, 85 m. S. S. E. of Paris, on the Southeastern railway, in the midst of the forest to which it gives its name; pop. in 1866, 10,787. It has a college, a public library, three handsome barracks for cavalry and infantry, a hospital founded by Anne of Austria, an asylum for girls established by Mme. de Montespan, an obelisk erected on the marriage of Louis XVI. with Marie Antoinette, and the old residence of Gabrielle d'Estrées. Its manufactures of porcelain and earthenware have some reputation; and the delicious grapes from 1837 to 1840, and Napoleon III. did not neglect it. It is in fact a collection of palaces of different epochs and styles, and its ornaments, pictures, and statuary, are of the highest excellence. Its library is invaluable. This château has been the scene of many historical events. Philip IV., Henry III., and Louis XIII. were born in it. Christina of Sweden inhabited it during her sojourn in France; and it was here that in 1657 her favorite Maldeschi was put to death by Santinelli. Here an alliance with Sweden was signed in 1661, and here in 1685 Louis XIV. signed the revocation of the edict of Nantes. Pope Pius VII. was confined within its walls for 19 months (1812-14); and Napoleon, who had signed here his abdication, April 11, 1814, bade farewell on the 20th of May to his old guard at the principal entrance of the palace, known as la cour du cheval blanc. He signed his second and final abdication here, June 22, 1815.—The forest of Fontainebleau (area, 41,000 acres), which was originally called the forest of Brière or Bière (Sylva Biria), is as fine as any in France, and abounds in game. It is adorned with statues, temples, lakes, waterfalls, and fountains. Its varied and picturesque scenery is highly appreciated by travellers and landscape painters, while its quarries supply the capital with most of its paving stones. *An Histoire de la forêt de Fontainebleau* was published by Paul Donner in 1873.

**FONTANA,** the name of many Italian painters of the 16th and 17th centuries, prominent among whom was Prospero (1512-97), the instructor of the Carracci. He was one of the most prolific painters of the Bolognese school, but was hasty and reckless in his work. His masterpiece is the "Adoration of the Magi" in the church of Santa Maria delle Grazie in Bologna, which has been described as approaching the style of Paul Veronese. His daughter Latina (1552-1614) attained almost the excellence of Guido in some of her portraits.—Famous among the architects of the Fontana family was Domenico (1548-1607), who finished the cupola of the basilica of St. Peter, placed the stupendous obelisk which had been brought from Egypt in the reign of Caligula on the piazza of St. Peter (1586), despite great difficulties, and was ennobled and magnificently rewarded by the pope. He also designed the library of the Vatican and completed the pontifical palace of Monte Cavallo. Clement VIII. having disgraced him on account of a false
charge of his having acquired his fortune dishonestly, he spent the latter part of his life in Naples.—Another eminent architect, CARLO (1634–1714), was employed in Rome under seven successive popes. Among his best known works are the Cibo and Ginetti chapels and the Grimani and Bolognetti palaces, the latter since known as the palazzo Torlonia.

**FONTANES, Louis marquis de**, a French writer, born in Niort, March 6, 1757, died in Paris, March 17, 1821. Going to Paris when still very young, he contributed some poetical pieces to the *Mercure de France* and the *Almanach des muses*, but his reputation began with his translation of Pope's "Essay on Man," published in 1783. On the breaking out of the revolution he joined the moderate party, and in 1793 wrote the petition which the citizens of Lyons presented to the convention against the bloody tyranny of Collot d'Herbois. After the 9th Thermidor he became one of the contributors to the *Moderateur*, a newspaper in the royalist interest. After the 18th Fructidor he took refuge in England, where he met Chateaubriand, and a lasting friendship grew up between them. Allowed to return to France after the 18th Brumaire (November, 1799), he was appointed by the first consul to deliver a panegyric on Washington. He became a member of the legislative body in 1802, and was chosen its president in 1804. On the reestablishment of the French university in 1808, Napoleon placed him at its head with the title of grand master; and in 1810 appointed him senator. Fontanes, who had always been a royalist at heart, deserted his protector in 1814, voted against him in the senate, and joined the new king. He thus secured the tenure of his offices and dignities, and was promoted to the peerage. During his later years he devoted his leisure hours to an epic, *La Grece detruite*, which he did not complete. His adopted son having been killed in a duel, he died broken-hearted. His finished style of oratory and the purity and terse elegance of his poetry have given him the title of "Racine's last descendant." A collection of his speeches was published in 1821, and his works were edited by Sainte-Beuve, with a biography (2 vols. 8vo, 1887).

**FONTANES, Marie Angélique de Serraille de Bourbon**, duchess de, a mistress of Louis XIV., born in the district of Roinergue in 1661, died in Paris, June 28, 1681. A member of a noble but impoverished family, she went to the French court as a maid of honor of the queen dowager, and became through her remarkable beauty Mme. de Montespan's successor as chief favorite of the king. Her discarded rival characterized her as a provincial stature. Her extravagance knew no bounds; the king supplied her with 500,000 francs a month, which was no unusual sum. She brought into fashion a head dress arranged with leaves and ribbons, which was adopted all over Europe under her name. Louis XIV., conferred upon her the rank of duchess, but became indifferent to her after the loss of her beauty in childbed. She retired to the abbey of Port Royal, where the king paid her a visit in her last moments.

**FONTENAY-Le-Comte**, a town of France, formerly the capital of a department in Poitou, now in the department of Vendée. It is 85 m. S. E. of Napoléon-Vendée; pop. in 1866, 8,062.

It has several remarkable churches, a college, four convents, a fine theatre, and three yearly fairs, and carries on a considerable trade in wine, staves, charcoal, leather, linen, coarse cloth, cordage, and timber. During the French revolution its arms were changed to Fontenay-le-Peuple. In a public square is an ancient fountain, from which the town takes its name.

**FONTENELLE, Bernard le Bovier or le Bovier de**, a French writer, born in Rouen, Feb. 11, 1657, died in Paris, Jan. 9, 1757. He was the nephew of Cornelle by his mother. He studied law, but not succeeding in his first suit devoted himself to literature. His first performances were light poems, pastorals, and plays: his tragedy of *Aegus* which appeared in 1800, was hissed by the public, and ridiculed by Racine and Boileau. In 1683 he published the *Dialogues des morts*, which made the beginning of his reputation. His *Entretiens sur la pluralité des mondes* (1686) and *Histoire des oracles* (1687), the latter an abridgment of a Latin work by Van Dale, a Dutch author, rendered him popular among those who were fond of scientific matters expounded in an elegant and somewhat affected style. In 1688 he published *Poesies pastorelles*. His *Histoire de l'académie des sciences* (1696–99) and *Éloges des académiciens* (1708–19) are still admired for their clearness and elegance. In 1699 he was elected perpetual secretary of the academy.

**FONTENOY**, a village of Belgium, in the province of Hainaut, 5 m. S. E. of Tournay; pop. 800. It is noted for a victory of the French over the English, Dutch, and Austrians, May 11, 1745, fought by the latter for the relief of Tournay, then besieged by the French. The French, 76,000 strong, led by Marshal Saxe and animated by the presence of Louis XV. and the dauphin, were posted on a hill with Fontenoy before them, the village of St. Antoine and the river Schedt on the right, and a small wood on the left. Their naturally strong position was so fortified as to be deemed almost impregnable. The allies, numbering 50,000, more than half of whom were English, were under the duke of Cumberland. They attacked the French outposts on the 10th, and early the next morning began the engagement by a fierce cannonade. The Dutch undertook to carry St. Antoine and Fontenoy by assault, but were driven back in disorder. Gen. Ingoldsby, who had been ordered to pierce their left flank, with a British division, retired with dishonor, while the duke of Cumberland, with 14,000 British and Hanoverian infantry marching in columns of 80 or 40 front, led the assault upon the
main body. With bayonets fixed they plunged down a ravine which separated them from the French line, and, while artillery mowed down their ranks from right and left, marched steadily forward with rapidly diminishing numbers but unfailing courage. They gained the hill in a solid mass, cut down everything before them, and had nearly won the day by intercepting the French retreat to the Scheldt, when Saxe, having in vain urged the king to fly, collected his force for a last effort. Four pieces of cannon were brought to bear upon the British front, while the household troops, the reserve, and foremost of all the brigade of Irish exiles, charged on either flank. Exhausted and unsupported, the English fell back. Their cavalry came to the rescue, and they reached the allied position with unbroken ranks, having twice cut through more than five times their number. The allies retreated to Ath, leaving about 8,000 killed, wounded, and prisoners, while the French acknowledged an almost equal loss. The young duke de Gramont was one of those who fell. The speedy fall of Tourne- nay and the conquest of Ghent, Bruges, Ostend, and Dendermonde were the fruits of Marshal Saxe's victory.

**Fontevraud (Lat. Fons Ebraladi), Order of, a monastic order in the Roman Catholic church, founded about the year 1100 by Robert of Arbrissel. The abbey of La Roca, in the forest of Craon, was an establishment of regular canons, which also owed its origin to Robert of Arbrissel. It had ceased for some time to be governed by him when he withdrew with three other renowned preachers to the desert vale of Fontevraud, on the Viaene, near its junction with the Loire. There, beside the burial place of the Plantagenets, he laid the foundation of four distinct establishments: Grand Montier for nuns, St. Lazare for lepers, St. Magdalen for penitent women, and a monastery for men. To the inmates, called for a long time "the poor of Christ," he gave the rule of St. Benedict, somewhat modified. This foundation, as well as the modified rule, was approved in 1106 by the council of Poitiers, and the bishop of that city obtained from Pope Pascal II. the confirmation of the new order on March 26 of the same year. The most remarkable feature in its constitution was that the whole order was governed by a woman, the founder himself vowing obedience with all his followers to Harlande de Champagne, the first abbess general. Robert then devoted himself exclusively to the extension of the order, which soon spread over the continent of Europe and had several houses in England. It numbered 3,000 monks and nuns at the death of the founder in 1117. The severe discipline maintained at Fontevraud had obtained for the order a high reputation from the popes. The most rigorous of its observances were abolished by Eugenius III. In 1459 dissensions arose in the order about some contemplated reforms; and the monks, casting aside the rule of St. Benedict, adopted that of St. Augustine, and called themselves canons regular. The 28th abbess general, Mary of Brittany, in 1475 drew up a new constitution combining the statutes of the founder with what was most appropriate in the rules of St. Benedict and St. Augustine; and it was approved by Sixtus IV. After much opposition, this constitution was adopted by the order in 1507, the recusants forming an independent congregation. The monks, having endeavored in 1520 to submit the authority of the abbess to the control of a council, were condemned by the local authorities, and the sentence was ratified in 1528 by Clement VII. A new effort to shake off this female yoke was made under the pontificate of Urban VIII., who favored such a reform. But an ordinance of Louis XIII., enjoining the strict observance of the bull of Sixtus IV., put an end to all hopes of change. The order was suppressed during the French revolution, and has not been revived.—The title of abbess of Fontevraud was always conferred on a lady of royal blood. The members were mainly recruited from the upper classes; and to the nuns were intrusted the education of the royal princesses, filles de France. At its most flourishing period the order of Fontevraud was divided into four provinces: that of France, composing 5 priories; that of Aquitaine, 14; that of Auvergne, 18; and that of Brittany, 18. Within the central establishment at Fontevraud were five churches, the vast courts and buildings forming a little city in themselves. Four of the churches and several of the outbuildings were destroyed in the French revolution. The remaining church edifice, one of the largest in France, and what remains of the monasteries, are now used as a central prison for 2,000 men and boys, from 11 neighboring departments. Napoleon III. in 1867 offered to Queen Victoria the statues of Henry IV., of Bourbon, Eleanor of Aquitaine, and Isabel of Angouleme, which adorn their tombs in the adjoining mausoleum; but the director of the establishment refused to give them up to the English agent, and all France protested against the spoliations.**

**Fonvieille, Wilfrid de, a French author, born in Paris in 1828. He taught mathematics and devoted himself to the popularization of scientific subjects, to journalism, and to aeronautics. His principal works are: L'Homme fossile (1865), Les merveilles du monde invisible (1866), Ecole et tonnerres (1867), and L'Astrotomie moderne (1888), some of which have been translated into English. He published in 1870 a narrative of his aeronautic voyages, which is included in Glaisher’s "Travels in the Air" (London, 1871).**

**Foochow, Foochow, Foochow, or Foochow-foo (called also by the inhabitants Hok-cun, "Happy Region"), a city of China, capital of the province of Fokien, and one of the ports open to foreign trade, in lat. 26° 5' N., lon. 119° 20' E., 150 m. N. N. E. of Amoy, 420 m. N. E. of
FOOCHOW

Canton, and 375 m. S. S. W. of Shanghai; pop. variously estimated from 600,000 to 1,250,000. It stands on a plain about 2½ m. from the N. bank of the Min and 25 m. from its mouth, surrounded by an amphitheatre of hills about 4 m. distant, and defended by a wall 7 m. in circuit, 20 to 25 ft. high, and 13 to 20 ft. thick. The city has seven gates, over which are high towers. Outside of each gate are large suburbs. The most extensive are those on the south, known by the name of Nantí, which extend for 4 m. southward, and along both sides of the river. They communicate by two bridges resting on a small densely populated island called Chungchow (Middle island). The northern bridge, called the bridge of 10,000 ages, or big bridge, said to be 800 years old, is about a quarter of a mile long and supported by nearly 40 piers placed at unequal distances. Across these piers are immense stones, 3 ft. square and about 45 ft. long, and over these a granite platform. The sides are lined with shops. The city proper is regularly built, but the streets, though paved with granite and in many instances planted with trees, are exceedingly filthy, narrow, and infested with beggars whose squalid and loathsome appearance is beyond description. The houses are usually of wood, one story high, with tiled roofs. A semi-transparent shell ingeniously arranged in rows is sometimes used for windows. Great numbers of the inhabitants live in hovels on the river. There are some handsome buildings, among which are the residences of the civil and military officials of the province. The temples are numerous, the largest being that known as the Ching-hwang-miao; the most beloved deities are the god of war and the goddess of mercy. The numerous shops are stocked with a profusion of goods of rather poor quality. They are quite open, and with the full display of their contents, the jostling and noise of the hucksters, and the crowded state of the streets, give the thoroughfares much the appearance of a market place. One of the most singular features of Foochow is the great number of towers erected in all parts of the city, on the walls, over the streets, and even on the houses, some of them covered with grotesque ornaments. The town has three principal hills within its walls, two in its southern and one in its northern quarter. A part of the E. and S. quarters of the city is inhabited by the Mantchou Tartars, who number between 10,000 and 15,000 souls. They are of larger build and finer form than the Chinese, and their women do not compress their feet. The men professedly belong to the army, though the number receiving pay and rations does not exceed 1,000. The entrance to the Ho-ho, or main city gate, is about 18 ft. high and 12 ft. wide. Foreign pilots take charge of vessels as far as the mouth, whence native pilots navigate them up to the pagoda anchorage, where the Chinese have an immense arsenal and dockyard, built in foreign style by officers of the French navy. Above this place the water is too shallow for large vessels to proceed safely. The foreign settlement and consulates are only 3 m. from the city down the river. Foochow is a city of the first class (foo), and is the seat of a viceroy or governor general, whose jurisdiction extends over Fokien and Chekiang, its adjacent northern province; of a governor, a Tartar general of the same rank as the viceroy; of the provincial criminal judge, two district magistrates, the provincial treasurer, commissioner of the salt and provision department for the whole province, and the literary chancellor. A board of trade, consisting of three members, for the arrangement of affairs arising out of intercourse with foreigners, was established here after the treaty of Tientsin. Foochow is a great literary centre. Numerous gentry who have retired from office in other parts of the empire, and men of high literary attainments, reside here. There is a large provincial examination hall, which contains about 10,000 cells, where the literary graduates of the first degree who desire to compete assemble. The examinations take place twice every five years. There are several cotton, paper, and hardware manufactories, also several hundred furnaces for making porcelain, and factories of blue cloth, screens, combs, &c. There are lead mines near by, and a great tea-growing district lies within 70 m. The commerce of the city is chiefly with Japan and the maritime provinces of China. The principal exports are black tea, which can be purchased cheaper than at Canton, timber, bamboo, fruits, oranges, peal, tobacco, potash, spices, grain, copper, and lead. The imports are opium (sometimes to the value of $5,000,000 per annum), salt, sugar, and European manufactures. The port is much frequented, the channel of the river and a sheet of water called Li-hu, or West lake, on the W. side of the city, being crowded with all kinds of vessels and floating habitations.

FOOD. See ALIMENT, CORPULANCE, and DIETETICS.

FOOL, or JESTER, a character in medieval courts and noble families, whose business it was to entertain the household by amusing salles. Somewhat similar were the parasites of antiquity, who were wont to pay for their dinners by jests and flatteries. Court fools do not appear distinctly and officially till after the crusades. They were at first either misshapen, half-imbecile dwarfs, who were themselves ridiculous objects, and whose senseless replies were welcomed with laughter; or quick-witted, half-mad fellows; or poor and merry poets. Among the insignia of the office were the fool's cap, party-colored, adorned with three asses' ears and a cock's comb, and worn on a shorn head; the variously shaped art and bauble; the bells, which decorated the cap and most other parts of the costume; and a wide collar. Besides the ordinary fools, there was a more refined class, called merry counsellors, who had higher privileges and considerable
influence, but who are commonly confounded with the court fools proper. One of the most celebrated fools was Triboulet, a favorite of Francis I. of France, who amused his master often by giving him most impertinent counsels. He carried tablets on which he inscribed the names of courtiers who had committed any act of folly. His successor was Brusquet, who combined other offices with that of fool, who suffered much from the tricks of the courtiers whom he mystified, and whose bon-mots have been often repeated. Earlier French fools of renown were Caillette, Thony, Sibilot, Chicoot, and the female Mathurine; and the annals of the office in France terminate with Angely, who was the titular fool of Louis XIII., and who became by his refined and cynical pleasantry one of the most formidable personages at court. Jodel der Narr, who was taken by the emperor Ferdinand II. to the diet in 1629, and Klaus Narr of Saxony, are famous among German fools. The office ceased in most European countries about the close of the 17th century, but continued longer in Russia, where Peter the Great often had twelve fools, whom he classified, and the empress Anne six, among whom were the Portuguese Da Costa and the Italian Pedrillo. In England the fools were long distinguished by a calf-skin coat, which had the buttons down the back. By the illuminators of the 13th century they are represented as squalid idiots, wrapped in a blanket, and holding a stick with an inflated bladder attached to it, which served as a babble. From the 16th century they were often men of ability, and their entertainment consisted in witty retorts and sarcastic reflections. Though their license was extensive, they were liable to correction or discharge from office.—See Flögel's Geschichte der Hofnarren (Leipzig, 1789).

FOOLAHs, Faful (sing. Fallo), Felati, or Felatah, a people of west and central Africa, comprising many tribes scattered along the Niger valley, between Timbuctoo and the kingdom of Dahomey, and Bondoo and Darfoor. Originally they were nomadic, their chief occupation being cattle breeding; but about the middle of the 18th century, most of them becoming converts to Islamism, they began to found independent states, and to conquer the adjacent tribes. About 1802 one of their chiefs, called Othman or Danfodio, undertook to emulate the career of Mohammed, and laid the foundation of an empire at Sackatoo. He died in a sort of fanatical ecstasy in 1818. His successors a few years ago could bring into the field about 25,000 cavalry. Gando, about 40 m. from Sackatoo, is the seat of another powerful Foolah prince; and at Timbo, the capital of Foota Jallon, resides a third. The aggregate area of the Foolah countries is estimated at over 800,000 sq. m.; the population at about 6,000,000. It is the opinion of modern travellers that the Foolahs are destined to become the dominant people of Negroland, and they have excited more interest and scientific research than almost any other African race. In language, appearance, and history they present striking differences from the neighboring tribes, to whom they are superior in intelligence, but inferior, according to Barth, in physical development. Golbery describes them as robust and courageous, of a reddish black color, with regular features, hair longer and less woolly than that of the common negroes, and high mental capacity. Lander, who saw them near Borgoo, says that they differ little in feature or color from the negroes; other travellers speak of them as having tawny complexions and soft hair. Dr. Barth found great local differences in their physical characteristics, and Bowen describes the Foolahs of Yoruba as being some black, some almost white, and many of a mulatto color varying from dark to very bright. Their features and skulls were cast in the European mould. They have a tradition that their ancestors were whites, and certain tribes call themselves white men. Some of them relate that they came from the country around Timbuctoo, and the prevailing opinion has been that their course of conquest was from central or east Africa westward; but Dr. Barth agrees with Clapperton in thinking that they made a second migration from the Senegal toward their birthplace, in the course of which they absorbed or conquered the tribes in their march. Their language is neither African nor Semitic. Foolahs are found in the suburbs of most of the towns of Soodan, pursuing the avocation of dairymen and cattle breeders. Most of them are Mohammedans. The usual dress of the men is a red cap with a white turban, a short white shirt, a large white robe, white trousers trimmed with red or green silk, and sandals or boots.
women wear a striped garment falling as low as the ankles. The children of both sexes of the better classes are taught to read and write Arabic. The men wear swords at all times, and even go armed with bows and arrows on horseback. The sovereign of each Foolaha state appoints governors of the provinces at pleasure, and on their death succeeds to all their effects. The Foolahs are in continual hostility with the Arabs.—See, besides the narratives of the travellers above mentioned, and the ethnological works of Prichard and Latham, Histoire et origine des Poluhas ou Polihas, by Gustave d’Eichthal (Paris, 1842).

FOOLS, Feast of, a mediaeval grotesque religious ceremony, celebrated for several centuries, chiefly in France, at the festivals of the Nativity, the Circumcision, the Epiphany, the Murder of the Innocents, and especially at Christmas and Easter. The custom and amusements usually connected with the pagan Saturnalia had continued, in spite of prohibitions, to be observed among Christians both of the East and West, and gradually attached themselves to the Christian festivals occurring in December and January, which had been the months of the pagan celebrations. The festum satiurum or foliorum was a mixture of farce and piety, and a sportive travesty of the offices and rites of the church. The priests and clerks elected a pope, archbishop, or bishop, and conducted him in great pomp to the church, which they entered dancing, masked, disguised as women, animals, and merry-andrews; they sang infamous songs, converted the altar into a buffet, where they ate and drank during the celebration of the holy mysteries, played with cards and dice, burned old sandals instead of incense, ran about leaping, and amused the populace by indecent alluies and postures. The feast of fools was prohibited by the bull legate Peter of Capua in the diocese of Paris in 1198, and was condemned by the Sorbonne in 1444, but did not entirely disappear till toward the end of the 16th century. It was known in Germany only in the cities on the Rhine.

FOOT, a measure of length indicating its origin by its name, in general use in all civilized countries, and supposed to be adopted from the length of the human foot, possibly at first of some reigning sovereign. The length is very variable within moderate limits in different countries. The Roman pes has been calculated from several sources, as ancient measures, measurements of recorded distances along roads, and measurements of buildings of recorded dimensions. From the first source their foot appears to have been 0.9718 of the English foot, from the second 0.9709, and from the third 0.98094; the average of which would be 11-650 inches. The Greek σταθ as used at Athens is believed to have been to the Roman foot as 25 is to 24, making it 12-136 English inches. The English standard, after a prolonged effort to recover the standard of 1760, which had been destroyed by fire, is now referred to the "straight line or distance between the centres of the two gold plugs or pins in the bronze bar deposited in the office of the exchequer. This bar is designated as "bronze bar No. 1," and the length is to be measured when its temperature is 62° F. This is declared to be the standard yard, and the standard foot is its third part. The twelfth part of the foot is the standard inch. The United States standard is a brass rule made for the coast survey by Troughton of London, from the old English standard. The following are a few of the principal feet, with their value in decimals of the English foot: The French old pied du roy equals 1.07, the modern pied usuel, 1.094; German, 0.971; Amsterdam old foot, 0.98, since 1820, if used, 1.094; Denmark Rhineland foot, 1.03; Hamburg, 0.94; Stockholm, 0.97; St. Petersburg, 1.145; Riga, 0.99; Canton, 1.05; Lisbon, 0.927, or according to others, 0.78; Turkey, 1.16; Constantinople, 1.29. As used by surveyors and engineers, the foot is usually divided. Architects and artisans employ it with these divisions, and their scales are also made with inch divisions, and these subdivided into eighths and sixteenths of an inch.

FOOTA, a territory of Senegambia, west Africa, extending from the Senegal on the north-west to North Gangara on the southeast, between lat. 15° and 18° 26' N., and long. 12° 86' and 18° 36' W.; area about 15,000 sq. m.; pop. estimated at 400,000. It is a fertile, well watered country, producing rice, gum, tamarinds, cotton, tobacco, and various kinds of grain. Large forests are spread over the surface, pasture lands support sheep and cattle, and there are several mines of iron. The inhabitants are mostly negroes, active and industrious, but, like most of their race, extravagantly superstitious. They professMohammedanism, and still form part of the wretched hunters. They cultivate the ground with considerable skill, and are active fishermen. Their manufactures are confined to cotton cloth and earthware. The country is divided into three parts or provinces, viz.: Foota Toro on the north, Foota proper in the middle, and Foota Damga on the east. Each of these has its chief, subject to the almamy or sovereign, who is chosen from a few privileged families by a council of five. His authority is both secular and sacerdotal, but the council has the right of reprimanding, deposing, or in some cases putting him to death. The fanaticism of the people is a great impediment to European commerce, but in 1807 the French erected a fort at Podor, on the Senegal, for the protection of traders.

FOOTA JALLON, or Fatajallay, a large territory of Senegambia, W. Africa, situated about the sources of the Gambia, Rio Grande-de-Jeba, and Joliba or Niger, and intersected by lat. 12° N. and long. 19° W. It is mountainous and rocky, but about one third of it is extremely fertile, producing rice, maize, oranges, bananas, dates, honey, wax, wine, and oil, while large flocks of sheep pasture on the highlands. Iron
ore is wrought and manufactured into a very malleable species of metal. The inhabitants are Mohametans, descendants of the Foolah race, remarkable for their fanatical hatred of all infidels except the whites, from whom they claim descent. Their houses are neat and well built; the principal towns contain manufactories of articles of dress, of iron, silver, wood, and leather. Trade is carried on with Timbuctoo and other places, and the merchants often make long commercial journeys. Timbo, the capital, is said to contain 7,000 inhabitants, and there are several other towns with a population of between 3,000 and 5,000. The government is elective.

FOOTE, Andrew Hull, an American naval officer, born in New Haven, Conn., Sept. 13, 1808, died in New York, June 26, 1883. He entered the navy in 1822 as acting midshipman, became passed midshipman in 1827, and lieutenant in 1830. In 1838 he was flag lieutenant of the Mediterranean squadron, and in 1838 circumnavigated the globe as first lieutenant of the sloop of war John Adams, participating in an attack on the pirates of Sumatra. While stationed at the naval asylum in 1841-43 he prevailed upon many of the inmates to give up their spirit rations, and during the cruise in the Cumberland in 1845-46 he not only induced the crew to forego the use of spirits, but personally superintended their religious instruction, delivering every Sunday an extemporaneous sermon. In 1849, in command of the brig Perry, he joined the squadron on the African coast, where during the next 2 years he was actively engaged in suppressing the slave trade. After serving on the naval retiring board, he was appointed in 1856 to the command of the sloop Portsmouth, and ordered to proceed to the China station. Arriving at Canton just previous to the commencement of hostilities between the English and Chinese, he exerted himself in protecting the property of American citizens; and having been fired upon from the Canton barrier forts while in the discharge of this duty, he demanded an apology. This being refused, he attacked the forts, four in number, with the Portsmouth, supported by the Levant, breached the largest and strongest, and, landing with a force of 280 sailors and marines, carried the work by storm. The remaining forts were successively carried, with a total loss of 40 to the attacking party. The works were massive granite structures, mounting 176 guns and garrisoned by 5,000 men, of whom 400 were killed and wounded. At the commencement of the civil war in 1861, Commander Foote was executive officer at the Brooklyn navy yard. In July he was commissioned a captain, and in September was appointed flag officer of the flotilla fitting out in the western waters. He personally superintended the completion of this work, and on Feb. 4, 1862, sailed from Cairo with a fleet of seven gunboats, of which four were iron-clad, to attack Fort Henry on the Tennessee river. Without waiting for the arrival of the land force under Gen. Grant, which was to cooperate with him, he opened fire upon the fort at noon of the 6th, and after an action of one hour compelled its surrender. Returning to Cairo, he sailed soon after for the Cumberland river, and on the 14th attacked Fort Donelson. The action was sustained with great vigor on both sides for an hour and a quarter, when the fleet was obliged to haul off, in consequence of two of the gunboats becoming unmanageable by having their steering apparatus shot away. Capt. Foote was severely wounded in the ankle, and his ship, the St. Louis, was struck 61 times. Though suffering from his wound, he proceeded down the Mississippi with his fleet, and commenced the siege of Island No. Ten. After the reduction of that place, he received leave of absence. Upon being restored to health, he was appointed chief of the bureau of equipment and recruiting. In July, 1863, he was appointed rear admiral, and in May, 1863, was ordered to take command of the South Atlantic squadron, but died while preparing to leave New York for Charleston. He was the author of "Africa and the American Flag" (1854), and a series of "Letters on Japan" (1807). His "Life" is announced as being in preparation by Prof. James Hopkin.

FOOTE, Henry Stuart, an American politician, born in Fauquier co., Va., Sept. 20, 1800. He graduated at Washington college, Lexington, Va., in 1819, was admitted to the bar in 1829, and in 1824 removed to Tusculum, Ala., where he edited a democratic newspaper. In 1826 he removed to Jackson, Miss. In 1847 he was elected to the United States senate, and was made chairman of the committee on foreign relations. In 1850 he took an active part in favor of the compromise measures, and in 1851, in a hotly contested election, was chosen governor of Mississippi, his competitor being Jefferson Davis. In 1854 he removed to California, but in 1858 returned to Mississippi, taking up his residence at Vicksburg. In the southern convention at Knoxville in 1859 he spoke warmly in opposition to disunion. During a great part of the civil war he was a member of the confederate congress from Tennessee, and distinguished himself by his personal and political hostility to Jefferson Davis. Not long after the close of the war he resumed the practice of law. He has been engaged in several duels, in two of which he was slightly wounded. He has published "Texas and the Texans" (Philadelphia, 1841) and "The War of the Rebellion, or Scylla and Charybdis" (New York, 1866).
the Temple, and, plunging into a career of pleasure, in less than four years dissipated at the gaming table and by reckless extravagance two fortunes which he had successively inherited from his uncle and his father. He thereupon became an actor, and in 1744 made his début at the Haymarket theatre in the character of Othello. He attracted little attention in tragedy or in comedy, and it was not until he brought the political and social notabilities of the day upon the stage by his wonderful gift of mimicry that he discovered his true road to success. In the spring of 1747 he opened the Haymarket theatre with a piece called "The Diversions of the Morning," written by himself, and in which he was the principal actor. The piece was successful almost beyond precedent. The licensing act having been applied against him by those whose foibles he had thus publicly portrayed, he made his peace a morning entertainment, and under the title of "Mr. Foote taking Tea with his Friends," it was repeated for more than 50 successful mornings. A similar piece, entitled "The Auction of Pictures," proved equally successful, and the author was complimented with the title of the English Aristophanes. He kept the Haymarket theatre open without a license for ten years (during which he found time to dissipate a third fortune), furnishing a constant supply of new plays to replace the old ones, and became the admiration of the town, and also its terror, as no person whose character possessed any vulnerable points was safe from his mimicry. In 1767 a fall from his horse occasioned the amputation of one of his legs; and the duke of York, who witnessed the accident, procured him a regular patent to open a theatre. He still wrote and acted, but less frequently than before; and in 1777, with a constitution undermined by ill health and mental suffering, he undertook a journey to France, and died on the way at Dover. He wrote about 25 plays, of which 20 have been published, and some others have been attributed to him. Those which have kept the stage longest are "The Minor," in which the Methodists are satirized, "The Englishman returned from Paris," "The Bankrupt," which attacks the newspapers, "The Orators," "The Lame Lover," "The Liar," and "The Mayor of Garratt." His dramatic works have never been published in a complete edition. William Cooke published his memoirs, and some of his writings (3 vols. 8vo, London, 1865).

FORAMINIFERA (Lat. Foramen, an opening, and forte, to carry), an order of the protozoa, of the class of rhizopoda, having the power of projecting and retracting through openings in their calcareous shell temporary thread-like prolongations (pseudopodia) of sarcode, or the gelatinous protoplasmic substance of which the body is composed; by these processes they move and obtain food; they differ from ameoba in having a shell, and very long slender pseudo-podia, interlacing with each other; they have no nucleus nor contractile vesicle, like the ameoba. The shell is often very complex and beautiful, enclosing the sarcode body, which has no structure nor definite organs, and yet has the power of making a calcareous or sandy shell. The shell may be single or many-chambered, the latter produced by the budding of the former. Placed very near the bottom of the animal scale, structureless and without permanent organs, they yet perform all the great physiological functions of life, digestion, growth, reproduction, secretion, and locomotion. They are mostly microscopic, though the nummulite attained the diameter of an inch. They are all marine, and are distributed all over the world; they have been dug up to a depth of nearly three miles in the vicinity of Spitzbergen. They were among the earliest created animals, and the oldest known fossil, _Coccon_, is a foraminifer; the great chalk deposit of Europe, wide as the continent, and sometimes nearly 1,000 ft. deep, is almost entirely made up of the foraminiferous _globigerina_, not to be distinguished from forms now living in the deepest Atlantic basin; the building stone of Paris is largely composed of foraminifera.

FORBACH, a town of Alsace-Lorraine, Germany, on the railroad near the frontier of Prussia, 11 m. N. W. of Saargemünd; pop. in 1871, 5,428. Near the town are the coal mines of Petite Rosselle, Urselsbach, Schönecke, and Stiring-Wendel, which annually yield about 50,000 tons. After the battle at the heights of Spichern (Aug. 6, 1790), in which Gen. Frossard was defeated by several divisions of the armies commanded by Gen. Steinmetz and Prince Frederick Charles, and which is called by the French the battle of Forbach, the town was occupied by the German troops, and was afterward annexed to Germany with the rest of Lorraine. It was previously the capital of a canton in the French department of Moselle.

FORBES, Archibald. See supplement.

FORBES, Duncan, a Scottish statesman, born at Buchrew, near Inverness, Nov. 10, 1668, died Dec. 10, 1747. He was educated at Inverness and Edinburgh, and at the university of Leyden, and in 1709 became an advocate. He had already won the friendship of John, duke of Argyll; and in 1715 he took an active part in suppressing the rebellion. He was appointed to aid in prosecuting the captured rebels, but it does not appear that he acted in the office, and he was prominent in siding the Scotch prisoners in England. In 1716 he was appointed advocate depute, in 1723 was returned to the British house of commons for Inverness, and in 1725 became lord advocate. The office of secretary of state for Scotland being at this
time discontinued, its duties devolved on the lord advocate, who was thus temporarily at the head of the government. The office of lord president of the court of session was conferred on him in 1787. He still paid regard to political affairs, and proposed that government should raise several regiments of highlanders, to be officered by the chiefs of the disaffected clans, and employed in the threatened Spanish war. Several leading men, including Walpole, approved the plan, but nothing was done. When the second rebellion broke out, in 1745, he exerted himself strenuously to prevent its spread, withheld several highland chiefs from joining the pretender, and was more efficient than any other man in restraining the rebels. After the battle of Culloden, which took its name from Forbes's family estate, he sought to moderate the ferocity of the victors, but his remonstrances were treated with the utmost scorn and contempt. He was invited by Cumberland, who called him "that old woman who talked to me about humanity." The government used him with baseness. He had advanced and borrowed large sums of money in aid of it, but none of his advances were returned, and the borrowed money was repaid from his estate, after his death, by his son. Forbes saw the changes that were forced upon Scotland after the rebellion with regret, and his death, which happened 30 months after the battle of Culloden, is supposed to have been caused by the humiliation of himself and his country. He was a Hebrew scholar, and wrote "Thoughts on Religion, Natural and Revealed," "Reflections on the Sources of Incredulity in regard to Religion," and "A Letter to a Bishop concerning some important Discoveries in Philosophy and Religion." His correspondence in relation to Scottish affairs was published under the title of "The Culloden Papers" (London, 1815); and his biography has been written by John Hill Burton (London, 1847).

FORBES, Edward, an English naturalist, born in Douglas, Isle of Man, early in 1815, died at Wardie, near Edinburgh, Nov. 18, 1884. In his 17th year he went to London with some idea of becoming a painter, and acquired a facility in drawing which afterward proved of great assistance in his scientific explorations. In 1838 he went to Edinburgh, where he studied medicine, but devoted himself especially to investigations in natural history, and never took the degree of M. D. Dredging in the waters for specimens of submarine zoology, which at the commencement of his studies was a comparatively new occupation to naturalists, became under his hands the means of opening a new field of research; and the results of his labors, published in the "Magazine of Natural History," under the title of "Records of the Results of Dredging," were among his earliest contributions to scientific literature. In his 18th year he made a summer excursion to Norway, bringing back abundant specimens of its rocks, plants, and mollusca. He remained connected with the university of Edinburgh till 1839, varying his residence there by excursions to southern Europe, the Mediterranean, and Algeria. The greater part of 1837 he passed in Paris studying geology, mineralogy, and zoology, and working in the museum and collections of the "jardin des plantes." During this period he published also papers on the "Mollusca of the Isle of Man," the "Land and Fresh-Water Mollusca of Algeria," on the "Distribution of the Pulmonifera of Europe," &c. In 1841 he published his "History of British Star Fishes," with 129 illustrations. In the spring of 1841 he went as naturalist on the surveying ship Beacon, destined for the coast of Asia Minor, where she was to receive the Xanthian marbles, the existence of which had recently been made known by the explorations of Sir Charles Fellows. During the 18 months that Mr. Forbes remained on board the vessel he established by dredging operations in various depths of water the fact that the distribution of marine life, like that of terrestrial animals and vegetables, is determined by certain fixed laws, and that the zones which the different species inhabit are as distinctly marked in the one case by the climate and the depth and composition of the water, as in the other by temperature, altitude, and other influences. The results of these researches were given in a paper entitled "Report on the Mollusca and Radiata of the Ægean Sea, and on their Distribution, considered as bearing on Geology," which was read before the meeting of the British association in Cork in 1843. He also assisted in the excavations of the cities on the Lycian Xanthus, the ruins of 20 of which he was instrumental in discovering. In 1846 he published, in conjunction with Lieut. Spratt, "Travels in Lycia, Millyas, and the Chrysita." In the latter part of 1842 he was recalled to England by his appointment as professor of botany in King's college, London, and was soon afterward appointed curator of the museum of the geological society, and palaeontologist of the new museum of practical geology, established in connection with the ordnance geological survey. He subsequently became professor of natural history at this institution. Among the first fruits of his labors was a treatise "On the Connection between the Distribution of the Existing Flora and Flora of the British Isles, and the Geological Changes which have affected their Area" (1848), in which the conclusions arrived at, after investigations in an unusually wide field of speculative research, are that the fauna and flora of Britain, both terrestrial and marine, are members of families inhabiting a contiguous continent, which at no very remote period existed in the Atlantic, whence they migrated before, during, or after the glacial epoch. Of papers on zoology and geology he prepared previous to 1850 upward of 89, exclusive of his botanical papers or those published after that date, which are numerous; and his note books and collections contained
the materials for many more. One of the most important works in which he took part after his connection with the geological society was the preparation of the palaeontological and geological map of the British isles, to which he appended an explanatory dissertation and a map of the "Distribution of Marine Life." In 1852 he was elected president of the geological society, and in the succeeding year obtained the professorship of natural history in the university of Edinburgh. He delivered a course of lectures in Edinburgh in the summer of 1854, but was soon after attacked by a disease of the kidneys, which ultimately proved fatal. In addition to the works enumerated, Prof. Forbes assisted Mr. Hanley in the preparation of the "History of British Mollusca" (4 vols. 8vo, 1853), the descriptions in which were written by himself, and contributed important information respecting the distribution of plants and animals to a revised edition of Johnston's "Physical Atlas." He also possessed a considerable knowledge of general literature, which in the intervals of his scientific labors he assiduously cultivated; and after his death his friends were surprised to learn that for a number of years he had been a regular contributor of miscellaneous articles to the columns of the London "Athenaeum" and "Literary Gazette," a collection of which was published under the title of "Literary Papers by the late Edward Forbes," with a Memoir by Huxley (12mo, 1855). His other posthumous publications are: "Zoology of the Voyage of H. M. Ship Herald" (8 vols. 4to), and "Mollusca and Radiata of the Voyage of H. M. Ship Herald," the latter written in conjunction with Prof. Huxley.

FORBES, James David, a Scottish physicist, born in Edinburgh, April 20, 1809, died at Clifton, Eng., Dec. 31, 1869. He was educated at the university of Edinburgh, and at the age of 17 he began a correspondence on scientific matters with Dr. (afterward Sir David) Brewster, which continued for some years, and Forbes's papers were published in Brewster's "Journal." In the summer of 1826 he visited the continent; he ascended Vesuvius, publishing his observations, and during this tour made his first visit to Athens. In June, 1830, he passed as an advocate, but immediately abandoned the bar to devote himself to scientific pursuits. In the ensuing winter he became a member of the royal society of Edinburgh. In September, 1851, he assisted in founding the British association. In January, 1853, at the age of 24, he was elected professor of natural philosophy in the university of Edinburgh, and entered upon the duties in November following. In 1857 he was appointed dean of the faculty of arts. His summer vacations were devoted to travel. He passed the summers of 1837 and 1888 in an extended tour through northern Germany and Austria; from May to August, 1839, he was in the south of France, and was more or less among the Alps; and in July, 1841, in company with Prof. Agassiz, he ascended the Jungfrau. His first Alpine experiences appeared in an article on glaciers in the "Edinburgh Review," April, 1842, though the year before he had published in the proceedings of the royal society his views on the peculiar structure of the ice in glaciers, and in August, 1840, he had crossed the southern spurs of Monte Rosa from valley to valley, exploring the glaciers as he went. In September, 1842, he was again at Chamouni, and numerous geological excursions to Vesuvius in the vicinity of Naples occupied him till the end of the year. In 1848 he published "Travels through the Alps of Savoy," and in April of that year he visited Mt. Etna. The summers of 1844 and 1846 he devoted to the measurement of the rate of motion in the Swiss glaciers. In the summer of 1845 he made a tour of the western highlands, explored Coolin mountain in the isle of Skye, in company with M. Necker, and found indisputable traces of glaciers. In September of that year Sir Robert Peel conferred upon him a government pension of £200 a year. He passed his vacation in 1850 at Chamouni, not specially occupied with glacier observations, but correcting and extending his survey. He crossed from the Glacier du Tour, descending into the Swiss Val Ferret by the Glacier de Salet, making the most interesting, most difficult, and last of his expeditions among the higher glaciers of the Alps. His survey of the Mer de Glace was the last of his Alpine work. His last scientific journey was in June, 1851, to Bergen, Norway, to observe an eclipse of the sun visible only in northern latitudes; and on his way to Christiania he visited the glaciers of the Hardangerfjeld. In 1858 he published "The Alps, their way and its Glaciers," and in 1855 "Tour of Mont Blanc and Monte Rosa." In December, 1859, he succeeded Sir David Brewster as principal of the United college in St. Andrews, and in April following he resigned his chair at Edinburgh. His health had been failing since 1852, and he resigned his principalship in October, 1868, two months before his death. He had received the degree of D. C. L. from Oxford university in 1855. Besides the works above enumerated, Dr. Forbes printed from 1827 to 1867 in the "Edinburgh Journal of Science" the proceedings of the royal society of Edinburgh and of the British association, the "Edinburgh New Philosophical Journal," and other publications, more than 100 important scientific papers on geology, meteorology, electricity, magnetism, refraction and polarization of heat, volcanic formations, temperature and conducting powers of different strata, excessive rainfall, and many other subjects. Among his original contributions to physical science is the polarization of radiant heat, which he confirmed by a variety of ingenious experiments. Besides his works on the Alps and Norway, he published 15 letters
and several papers on glaciers. He claimed the discovery of the real structure of glacier ice, and treatment of glaciers motion as a problem of mechanical forces and its examination as such; and, generally, the first attempt to explain the leading phenomena of glaciers. These claims involved him in a controversy with Prof. Tyndall and others. — See his "Life and Letters," by Shairp, Tait, and Adams-Reilly (London, 1873).

FORBES, Sir John, a British physician and writer on medical science, born at Cuttlatebrae, Banffshire, Scotland, in 1787, died in London, Nov. 13, 1861. He was educated at Marischal college, Aberdeen, served in the medical department of the navy, practised his profession at Penzance and Chichester, and finally removed to London. In 1824 he published translations of the works of Auenbruger and Laennec on auscultation, following them up by an original work of his own on the subject. He was instrumental in founding the British medical association, to the "Transactions" of which he contributed a paper on "Medical Topography of the Hundred of Penrith." He was also the chief editor of the "Cyclopedia of Practical Medicine," and for 12 years conducted the "British and Foreign Medical Review," retiring in 1848. He wrote "Observations on the Climate of Penzance and Land's End" (1828); "A Manual of Select Medical Bibliography" (1835); "Illustrations of Modern Mesmerism" (1840); "Treatise on Diseases of the Chest," and "Nature and Art in the Cure of Disease" (1857); "A Physician's Holiday, or a Month in Switzerland during the year 1848" (1849); "Memoranda made in Ireland in 1852" (1862); and "Sight-seeing in Germany," etc. (1855). He was physician in ordinary to the household of the queen, by whom he was knighted in 1858.

FORCADE, Eugène, a French author, born in Marseilles in 1820, died at Billancourt, near Paris, Nov. 8, 1869. He founded in 1887 the "Sémaphore," the principal newspaper at Marseilles, and edited it till 1840. In that year he went to Paris, and subsequently became the political editor of the "Revue des Deux Mondes." Overwork brought on insanity, the first symptoms appearing in 1868, while he was attending the funeral of Manin at Venice, and he never fully recovered his reason. He published "Études historiques" (1853), and "Histoire des causes de la guerre d'Orient" (1854).

FORCE, Peter, an American journalist and historian, born at Passaic Falls, N. J., Nov. 26, 1790, died in Washington, Jan. 28, 1868. He removed to New York when a child, became a printer, and in November, 1813, removed to Washington. In 1820 he began the publication of the "National Calendar," an annual volume of national statistics, which he continued till 1836. From Nov. 12, 1828, to Feb. 2, 1830, he published the "National Journal," a political newspaper, which was the official journal during the administration of John Quincy Adams. From 1836 to 1840 he was mayor of Washington, and was afterward president of the national institute for the promotion of science. In 1838 he made a contract with the government for the preparation and publication of a documentary history of the American colonies, of which nine folio volumes were published, under the title of "American Archives." This work occupied Mr. Force for 30 years, and in its prosecution he gathered a large and valuable collection of books, manuscripts, maps, and papers relating to American history. In 1867 this collection was purchased by the government for $100,000, and was transferred to the library of congress. He also published four volumes of historical tracts, relating chiefly to the origin and settlement of the American colonies; "Grinnell Land" (8vo, Washington, 1853); and "Record of Auroral Phenomena" (4to, Washington, 1860).

FORCELLINI, Egido, an Italian lexicographer, born near Pisa, Aug. 26, 1828, died April 4, 1788. Admitted into the seminary of Padua, his progress in the ancient languages induced his master Faccioliato to make him his assistant. In 1718 they conceived the project of publishing a universal dictionary of the Latin language; but Forcellini being sent in 1724 to Genoa as professor of rhetoric and director of the seminary, the execution of the task was suspended till his return in 1751. This great work was almost wholly executed by Forcellini, and for it he read with pen in hand not only the whole Latin literature, but all the collections of inscriptions and medals. He died before the work appeared in 1771, under the title of "Tutius Latinitatis Lexicon, consilii et cura Jacobi Faccioliati, opera et studio Aegidi Forcellini lucubratum."

FORCHHAMMER, Johann Georg, a Danish geologist and chemist, born at Helsing, Schleswig, July 26, 1794, died in Copenhagen, Dec. 13, 1865. He became secretary of Oersted, accompanied him on a mineralogical expedition to the island of Bornholm (1818-'19), and subsequently made several journeys in Great Britain, France, and Denmark at the expense of the Danish government. He was professor of geology at Copenhagen, and in 1851 succeeded Oersted as secretary of the academy of sciences. His principal works are "Dane- marks geognostiske Forhold" (1835), and "Skandinavien's geognostiske Natur" (1848). He also excelled as a lecturer on chemistry and mineralogy, and wrote a manual of universal chemistry (Lære bog i Stoffernes alminderige Chemie, 1834-'35).

FORCIBLE ENTRY. In law, the phrase forcible entry and detainer means the unlawful and violent entry upon and taking possession or keeping of lands or tenements, with actual or threatened force or violence. In nearly all, and indeed, in some form, in all our states, there are laws respecting this, which are usually very stringent. 1. It is regarded generally as an offence and made indictable, or
FORD, Richard, an English author and traveller, born in London in 1796, died at Heavitree, near Exeter, Sept. 1, 1858. He was educated at Winchester and at Trinity college, Cambridge, and was called to the bar at Lincolns Inn, but never practiced. In 1830 he visited Spain, where he spent several years in the study of the country and the people. From 1836 to 1857 he was a regular contributor to the “Quarterly Review,” in which his articles on the life, literature, and art of Spain attracted much attention. He was the author of Murray’s “Handbook for Spain,” first published in 1845, and rewritten and enlarged in 1855. His remaining publications are “Gatherings in Spain” (1848), and “Tauromachia, the Bull Fights of Spain, with 36 illustrations” (1852). His collection of books, prints, and pictures was one of the choicest in England.

FORDHAM, formerly a village in the town of West Farms, Westchester co., New York, but since Jan. 1, 1874, included in the 24th ward of New York city, situated on the New York and Harlem railroad, about 12 m. N. of the city hall and 2 m. from the Hudson river; pop. in 1870, 2,161. It is the seat of several Roman Catholic institutions, of which the most prominent is St. John’s college, standing on a slight eminence, surrounded by magnificent grounds. It was founded by the Rev. John Hughes, first archbishop of New York, and was opened for students June 24, 1841, most of the professors being secular clergy, and the Rev. John McCloskey, now archbishop of New York, first president. The college was chartered as a university in 1846; the first commencement for conferring degrees was held in July of the same year, and immediately afterward the place was transferred to the Jesuits, who broke up their establishment at Bardstown, Ky., and took charge of the institution at Fordham in September, 1846. The college buildings, 9 or 10 in number, cover about an acre, and the play grounds, lawn, &c., embrace about 20 acres. Immediately adjoining are the college farm and garden, embracing about 80 acres. The college library contains over 20,000 volumes, besides which the students have the use of two other libraries, containing about 4,000 volumes. There are valuable chemical and philosophical apparatus, and a geological and mineralogical cabinet, with about 3,500 specimens. The college combines the ordinary features of preparatory, grammar, and commercial schools with those of a university. In the commercial course the degree of bachelor of science is conferred. There are also several supplementary classes. Students are received at any age. The younger students are kept apart from the older class, and which the pupils are separated, according to age and proficiency, are allowed to have no communication with one another, each having its separate gymnasium and playground. In the senior class Latin is altogether spoken in
the lectures and recitations. During the scholastic year 1872-3 there were 18 professors and tutors, with whom were 700 students, of whom 2 were Jesuits, and 257 students. The whole number of graduates is 800. The college year is divided into two terms, the first beginning on the first Wednesday in September and ending Jan. 81, and the second beginning Feb. 1 and ending on the last Wednesday in June. There are two vacations, from Dec. 21 to Jan. 8, and from the last Wednesday in June to the first Wednesday in September. St. Joseph's academy for young ladies in 1872 had 4 instructors and 21 pupils. There is also an asylum for female deaf mutes. St. Joseph's theological seminary, formerly established here, has been removed to Troy. The village is a favorite summer residence.—In October, 1776, immediately after the evacuation of New York by the British troops, the American army occupied a series of entrenched camps on the hills from Fordham heights to White Plains. Several pieces of cannon have been dug up here, and the remains of earthworks and other fortifications are still seen in the vicinity.

**FORDYCE, David**, a Scottish philosopher, born in Aberdeen in 1711, died in 1781. He was educated for the church at the university of his native city, where in 1749 he became professor of moral philosophy. He afterward travelled through France, Italy, and other countries of Europe, but was lost in a storm off the coast of Holland. His most important works are: "Dialogue concerning Education" (2 vols. 8vo, London, 1745-8); "Theologus, a Dialogue concerning the Art of Preaching" (12mo, 1789); and "Elements of Moral Philosophy" (12mo, 1764).

**FORECLOSURE, S. MONTAGU.** A N. W. county of Pennsylvania; area, 876 sq. m.; pop. in 1870, 4,010. The Clarion river runs along the S. E. border, and the Allegheny intersects the N. W. part. The surface is hilly and irregular. Some of the land is too rocky for cultivation. The chief articles of export are pine timber and hard coal, the former of which is very abundant. The chief productions in 1870 were 5,882 bushels of rye, 17,508 of Indian corn, 33,466 of oats, 6,946 of buckwheat, 15,260 of potatoes, and 2,665 tons of hay. There were 2 flour and 18 saw mills. Capital, Marionville.

**FOREST GROVE,** a post village of Washington co., Oregon, on the Oregon Central railroad, 28 m. W. of Portland; pop. in 1870, 923. It is the seat of Pacific university, which has preparatory, normal, scientific, and collegiate courses, and a three years' course for young ladies. It was organized in 1859, and in 1872 had 7 professors and instructors, 160 students, and a library of 5,000 volumes.

**FORESTI, E. Felice,** an Italian patriot, born at Conselice, near Ferrara, about 1793, died in Genoa, Sept. 14, 1868. He took the degree of doctor of law at the university of Bologna, and practised as a criminal lawyer before the tribunals of Ferrara. In 1816 he was appointed prosecutor of Cremona in the Austrian dominions. He entered into a conspiracy to deliver Italy from Austrian rule; but this being betrayed by an associate, Foresti and several others were arrested and thrown into prison in Venice in 1819. After two years' confinement they were brought to trial and condemned to death, but the sentence was commuted to 20 years' imprisonment. They were kept until January, 1822, on the island of St. Michael, when they were taken to the fortress of Spielberg in Moravia. The hardships which they here endured have been narrated by Silvio Pellico in *Le mie prigioni*. In 1885 their punishment was commuted by the emperor Ferdinand to perpetual exile in America. They landed at New York near the end of October, 1886, where Foresti soon became a favorite in society, was appointed professor of the Italian language and literature in Columbia college, and for more than 20 years was a popular teacher in academies and private circles. For the use of his pupils he published a *Cretonomia italiana* (12mo, New York, 1847). In 1848 he went to Europe, but returned in 1849. Falling health having compelled him to seek a milder climate, he sailed for Genoa, where he was appointed United States consul, in the spring of 1858.

**FOREST, E. Frédéric,** a French soldier, born in Paris, Jan. 10, 1804, died in Besançon, June 20, 1872. He was a graduate of the military school at St. Cyr, and accompanied the first expedition to Algeria, whence he returned in 1844 with the rank of colonel. He became general in 1848, in 1851 commander of the legion of honor in reward for his reckless firing on the opponents of the coup d'état, and in 1833 he was made chief of division. In 1854 he commanded for a short time before Sebastopol. In the Italian war of 1859 he was the first to inflict a heavy blow upon the Austrians, at Monte bello. He distinguished himself also in other engagements, especially at Solferino, after which he was made a senator. In 1863 he served in Mexico at first under Bazaine, and was afterward invested with the civil and military administration as minister plenipotentiary. He confiscated the property of Mexicans hostile to the invasion, compelled the surrender of Puebla, May 17, 1863, entered the city of Mexico, June 10, and was appointed marshal. In the autumn he was recalled to France, owing to his dictatorial and ambitious disposition, and in December became commander of the second army corps. In 1867 he directed the exercises in the camp of Châlons, and then retired on account of ill health.

**FORFAR,** a royal and parliamentary burgh of Scotland, capital of Forfarshire, situated in the valley of Strathmore, near a small loch of the same name, 13 m. N. by E. of Dundee; pop. of the town in 1871, 11,085. It consists of two principal streets, with well built sub-
stantial houses. Among its public buildings are a handsome county hall, a court house, a library and reading room, and a mechanics' institute. Its staple manufacture is linen, chiefly sheets, osnaburgs, and dowlas. Shoes called brogues are also made largely for export. Forfar is connected by railway with Aberdeen, Arbroath, and the south. It has been a royal burgh since the reign of David I., and its castle, destroyed by Robert Bruce in 1307, was once a royal residence.

**FORFARSHIRE**, or *Agras*, an E. county of Scotland, on the coast of the North sea, and bordering on the counties of Kincardine, Aberdeen, and Perth, with the frith of Tay on the south; area, 675 sq. m.; pop. in 1871, 237,687. It has about 45 m. of coast. The surface is irregular and intersected by hills, the Benchennan, a part of the Grampians, in the N. W., and S. of and parallel to them the Sidlaw. The valley of Strathmore, which lies between these ranges, is celebrated for its beauty and fertility; and the part bordering on the sea is level, fruitful, and highly cultivated. The principal rivers are the Tay, N. Esk, S. Esk, and Iala. Agriculture is in a very advanced state. Wheat, oats, barley, potatoes, and turnips are raised largely; and sheep and cattle are bred to some extent. There are valuable deep-sea, herring, and salmon fisheries along the coast and in the rivers. The principal minerals are limestone and slate. Forfarshire is the seat of the coarse linen manufactories of Scotland. Its chief towns are Forfar, the capital, and Dundee, Montrose, Arbroath, and Brecelin.

**FORFEITURE**, in law, the loss of property as a consequence of some act which the law forbids and attaches this penalty to, or which the party has agreed not to do under the same penalty. Forfeiture is defined by Blackstone as a punishment which the law inflicts. It is so undoubtedly in all cases of forfeiture by crime; but we apprehend that it can be called punishment in the ordinary cases of civil forfeiture only as all consequences of wrong doing may be called punishment. Forfeiture was annexed by the law of England to many offences, as treason, felony, misprision of treason, presummary, drawing a weapon upon a judge, or striking any person in the presence of any of the king's courts of justice. Lands and hereditaments were forfeited only upon attainer or corruption of blood; but forfeiture of goods and chattels took place upon conviction. Attainer, and the consequent forfeiture, were the most powerful instruments by which the greatest tyrants among the English monarchs endeavored to confirm and increase their power. Our fathers held them in so much dread, that it was deemed that the constitution of the United States (q. d., iii., c. 11) declared that no attainer of treason shall work corruption of blood or forfeiture, except during the life of the person attained; and now in England, by statute 3 and 4 William IV., c. 106, forfeiture for crime, where it exists at all, is only for the life of the person attained.—Civil forfeiture may occur in three ways: 1. By operation of law, the principal instance of which at common law was the forfeiture of estates which were less than a fee, which was incurred when the holder made a conveyance of a greater estate than he held; as for example, if a tenant of land for life or years conveyed the land in fee, the grantee took nothing, but the whole estate of the grantor was forfeited to the remainderman, or reversioner. In the United States, however, a more just and rational rule prevails. With some diversity in its details, it may be generally expressed thus: A grant of more than the grantor has operates as a grant of all he has, and as to all that is more it is void. 2. When certain conditions are annexed to an estate, either in the deed or devise or otherwise, at the original creation, the penalty of forfeiture may be annexed to those conditions, and will take effect if they be broken; as if A grants to B land, on condition that neither he nor any one claiming by or through him shall put up a certain building, or any building within a certain distance of one of the boundaries, or any other thing of like kind, then if anything is done which violates the condition, the land is forfeited. It may be remarked, however, that the law does not favor conditions of this kind; and courts would construe them, where it could properly be done, either as giving a right to the grantor to abate and remove whatever thus violates the agreement, or as an injury for which compensation may be had in damages, leaving, in both cases, the estate undisturbed. 3. One may agree to pay a certain sum in case a less sum be not paid, or some other certain thing be not done, at a certain time. This is usually done by a bond; and the sum thus agreed to be paid is a penalty, which the courts of England and of the United States will reduce to the amount actually due. So one who becomes surety for another in a certain sum that this other shall appear at a certain time, forfeits the sum if that other does not appear. But on good cause being shown, courts have the power, and are usually willing to exercise it, to mitigate the penalty, and remit the forfeiture in whole or in part.

**FORGE**, a manufactory in which iron or steel is softened by heat and worked under the hammer. The term is also applied to works in which the native oxides of iron are reduced without fusion to a metallic state, and then forged into blooms or bars. Several forms of these are noticed in the article BLOOMARY. Forges differ from forgeries and blast furnaces in their products being articles of wrought iron, while those of the latter are castings. The works in which iron, taken from the blast furnaces, is converted into malleable iron by the process termed puddling (see Iron), are commonly called puddling furnaces from one department of the operation; but
they are also called forges from the hammering or rolling which succeeds the reduction processes in the furnace work. The process, as such, of forging is equally applicable to the working of other malleable metals, as gold, silver, and copper, when these are heated and hammered into desired shapes. —The immense variety of articles into which iron is fashioned requires forges of various dimensions, and many of them adapted for special uses. They agree, however, in the general character of the apparatus with which they are furnished. The smith's forge, fitted for all sorts of small work, is the best representative of the smaller forges. It is provided, first, with a small open fireplace or hearth, upon a sort of table in brickwork, 2 to 2½ ft. high. A chimney, open at the base, stands at one end, and a hood of sheet iron prevents the escape into the room of the vapors from the fire. Two fires are sometimes arranged under the same hood, and a double hearth is again obtained by building two hearths back to back, the same chimney having a flue for each fire. In the back wall of each hearth is fitted a cast-iron plate or back through which the perforated nozzle of the tuyere, or piece forming the extremity of the blast pipe, projects into the fire. The pipe connects with the bellows, which is so placed that the smith can work it with one hand, as he attends to the fire upon the hearth and the articles heating in it with the other. The fuel may be charcoal, bituminous coal, coke, or anthracite. Good hard-wood charcoal is an excellent material, not only for its great calorific property, but more particularly for its freedom from sulphur, the presence of which in the mineral fuels often results in serious detriment to the iron exposed to its action. Upon the hearth are laid the various kinds of tongs required for holding the different shaped pieces of iron. At the end opposite the chimney is a trough for water, into which the tools and work are dipped, as may be convenient, to cool them. It serves also, if kept scrupulously free from grease, for tempering articles of steel; and the water is also frequently sprinkled with a broom dipped in it over the fire, to check the combustion of the fuel at the surface. A stock of fuel is kept on the hearth by the trough, and as wanted it is drawn forward upon the fire. Conveniently near the hearth, and at the same height, is set the anvil, upon which the smith places the heated iron as he takes it from the fire. As the smith holds the hot iron upon the anvil with his left hand, he hammers it with the right, directing his blows and turning the work to receive the precise effect in a manner to be acquired only by long practice. If the work is heavy, he requires an assistant to aid the forging by striking with a heavy sledge, while he turns the piece to receive the blows, and strikes himself in turn with his hand hammer, tapping it at last upon the face of the anvil as the signal, universally adopted, for the blows to cease. Hammers are employed of a great variety of shapes and sizes adapted to the different kinds of work. There are also punches for driving holes through the soft iron, chisels of numerous shapes, and swaging tools, which are generally in pairs, and called top and bottom tools, the latter fitting by a tang into a hole in the anvil. —The great forges in which are fabricated the immense wrought-iron shafts for ocean steamers present the same class of operations, with some new appliances, however, adapted to the gigantic scale upon which the work is done. The fires in these forges are either large reverberatories or close furnaces, blown by a powerful fan blast. The work is commenced by introducing 15 to 20 pieces of square iron bound together, making, it may be, a bundle 6 ft. long and 3 ft. square, into the furnace. When one end is brought to a welding heat the mass is swung out suspended in chains from the great crane and subjected to the blows of a heavy hammer, or 3 to 4 tons weight, moved by its own gravity, or a lighter hammer is used, moved by steam. One long rod is left projecting on the line of the axis of the mass, and serves when swung in the crane as a guide rod, or porter, as it is called. By means of the pulleys which sustain the load running forward and back upon the jib of the crane, the mass is brought to any desired point within the area traversed by the swing of the crane; and by means of a cross lever or handle fixed to the end of the porter the men are enabled to turn the mass of iron while the other end of it is receiving upon the anvil the blows of the hammer. When the iron has been sufficiently hammered, it is returned to the furnace to be again heated, so as to extend the weld throughout the whole mass. After this a slab of wrought iron, called by the workmen a sack, is welded on one side at the end of the piece, and under the hammer the shaft thus built up is drawn down to the required size. New additions are repeatedly made in this way until the desired length is obtained. Only the end of the shaft is thrust into the furnace, and the aperture which remains open around it is stopped during the heating by fire brick and clay. The end outside remains supported in the chains from the crane. The weight of the intermediate paddle shaft of the Great Eastern, which was launched at the end of January, 1858, is upward of 22 tons, and that of the cranks 11 tons. Its length is 23 ft., and its diameter 2 ft. 2 in., and it is 3 ft. in diameter at the main bearings. The cranks are 7 ft. long between the centres. The screw shaft is 3 ft. in diameter and about 175 ft. long, and its whole weight about 135 tons. FORGERY, in general, the illegal falsification or counterfeiting of a writing. Although this offence is the subject of a great variety of cases in England and the United States, the definitions do not quite agree. That given in East's "Plea of the Crown" (vol. ii., p. 852) is: "A false making of any written instrument
for the purpose of fraud and deceit." This definition, he says, results from a comparison of all the authorities. But by making we must understand also additional substitution, or other material alteration, which indeed East himself admits; and by instrument, some paper or document which is intended to have and apparently may have some efficacy in law as the foundation of legal right or liability. A better definition is that in Bishop's "Criminal Law," vol. ii., sec. 483: "Forgery is the false making, or materially altering, with intent to defraud, of any writing, which, if genuine, might apparently be of legal efficacy in the foundation of a legal liability." For it is not every falsification of writing which constitutes forgery in a legal sense. If one writes letters and signs them with the name of another, which may be very injurious not only to the feelings of some other party but to his interests, he is not in law a forger, if no pecuniary rights, obligations, or engagements are or are intended to be directly affected by this falsehood. The falsification need not be of a name, nor of the whole of an instrument. It is forgery if it relate to a single word, or even to a part of a word, as a letter, whereby the legal operation of it is materially changed; nor do we know why the same rule should not include a change only in the punctuation. Forgery may consist in the application of a false name to a true instrument, or of a true name to a false instrument, or even of a genuine name to a genuine instrument, if the name thus appended gives rights or imposes liabilities which the party appending it had no right to give or impose, and he appended the name falsely for the purpose of fraud and deception. If one employed to draw a will at the dictation of the testator, wrote it all as dictated, excepting that he inserted one or more legacies without direction, or one or more material provisions of any kind, and then, presenting the will to the testator as written agreeably to his direction, thus obtained his signature, it has been held that this is a forgery. To constitute the forgery of a name, it must be the name of some person actually existing, or represented as actually existing; and if a name be written which belongs to a living man, but with an addition or description which corresponds to none that exists and prevents the name from attaching or belonging to any one, this is said not to be a forgery. The instrument need not be such that if genuine it would be certainly valid in law; but it must purport and appear on the face of it to have legal validity and efficacy; thus, in England, one may be convicted for the forgery of an unstamped note, although such a note could not be enforced any more than blank paper. It is said, however, that the falsification of an instrument which if genuine would be wholly illegal, that is, not merely void, but prohibited and itself an offence, is not forgery. When one forged the will of a living person, and, falsely representing him to be dead, obtained the money, this was held to be forgery; and when one falsely and fraudulently appended to a will the name of a person who never had existed, this was also held to be forgery. At common law, the publication or uttering of the forged instrument, or, in common phraseology, the making of any use of it, is not necessary to constitute forgery; thus, a man was convicted of forgery of a note, which he had made with fraudulent intent, but still retained in his pocket. In the United States, however, the statutes generally make the uttering or using the forged instrument essential to the offence; but the uttering is complete if an attempt is made to use the fraudulent instrument as intended, though the forgery be detected in season to defeat the fraud designed. It may be well to remark that it is a well settled rule of law, that while an intent to deceive and defraud is an essential element of forgery, yet this intent is often conclusively presumed from the forgery itself; thus, if one forge a note, or any name upon a note, and cause it to be discounted, it is no defence whatever to the charge of forgery that he intended to pay the note himself, and had actually made adequate provision to take it up so that no person should be injured. The crime of forgery was so easily committed, and detected with so much difficulty, and attended in some instances with such ruinous consequences, that it was not only a capital offence in England, but it was one of those offences for which it is very difficult to obtain a pardon. But it is not now a capital offence in England or in any part of the United States.

FORGET-ME-NOT, the common name in several languages (Ger. Vergisameinacht, Fr. ne-moublies-pas) of the plant myosotis palustris (With.), of the family borraginaceae; other species of the genus are called scorpion grass. The forget-me-not is common throughout Europe, and is sparingly naturalized in this country. It assumes a varied aspect according to its situation, being dwarf, rough, and hairy in dry places, as on old walls, but becoming larger and smoother in muddy ditches. It does well when planted in shady places in the garden, or even on our purple. It is cultivated in pots, and is a charming plant in spring and early summer. Its flowers are borne in slender curving racemes, bending at the top like a scorpion's tail, whence it was formerly called M. scorpioides. Its bright blue flowers are in
FORK

many countries considered the emblem of friendship. The variety laxa, which differs from the type in having smaller flowers upon longer stalks, is a native of this country, and common in wet places at the north. M. versicolor (Nuttall), a little, grayish, pubescent annual, from 5 to 12 in. high, with a very small whitish corolla, is quite common upon dry rocks, where the soil is very thin and parched, the plant disappearing on the approach of hot weather. M. arvensis is sometimes found, and supposed to be introduced; and M. versicolor, another European species, grows in fields in Delaware. Several species besides M. palustris are in cultivation, as well as some garden varieties; among the most conspicuous of these are M. dimitisflora, M. Aeratica, and M. alpinastrum. The generic name (Gr. προκερ) means mouse-ear, and this is the popular name of some of the species in England.—It is a singular fact in the history of popular nomenclature, that about 200 years ago the name forget-me-not was used for a species of ajuga (bugle), for the reason that this plant when chewed left such an unpleasant taste in the mouth that it was not likely to be soon forgotten.

FORK, an implement consisting of a handle and two or more prongs, used to lift certain substances. Table forks do not seem to have been known in antiquity, though archaeologists have found articles among the rubbish in the Appian way and in the ruins of a Roman town in Champagne, which they considered to be table forks. The Jews and Etruscans did not use any at table, though they had forks for other purposes. The ancient Egyptians used a large fork for stirring the fire or water in the kitchens, and forks of wood were used by Egyptian peasants. The Greek word σπαγγα signifies a fork, but merely a flesh fork, employed to take meat from a boiling pot, and not one used at table. The Latin words furca, fuscina, furcella, and fuscinula are equally inapplicable to our modern forks. The first two were probably instruments which approached nearly to our furnace and hay forks. The furcella was large enough for a weapon. The word fuscinula, which in modern times is used chiefly for a table fork, is not to be found in that sense in any of the old Latin writers. The old translations of the Bible only explain the Greek σπαγγα by fuscinula. According to some records, the use of table forks seems to have been known in the 12th century, but only exceptionally. They are mentioned in the inventory of a prince’s plate in 1379, but they did not come into more general use in Italy till the end of the 16th century. Gaetanus Martinus, in a book which he wrote upon Matthiae Corvinus, king of Hungary (1440–1490), states that the king for eating without a fork, yet conversing at the same time, and never soiling his clothes. Martinus states that forks were used at that time in many parts of Italy, but not in Hungary. He adds that meat was ta-

ken hold of with the fingers, which on that account were much stained with saffron, a condiment then put into sauces and soups. In the 16th century forks were not yet used in Sweden, and at the end of that century they were novelties even at the court of France. In the convent of St. Maur in France, the introduction of forks was opposed as sinful by the old and conservative monks, and advocated by the young and progressive brethren. In other monasteries, too, the use of forks was for a considerable time forbidden, and considered a superfluous luxury. Thomas Coryat, who travelled in 1608 on the continent, and published in 1611 an account of his travels under the title of “Crudities,” says: “I observed a custom in all those Italian cities and towns through the which I passed, that is not used in any other country that I saw in my travels, neither do I think that any other nation of Christendome doth use it, but only Italy. The Italians, and also most strangers that are commorant in Italy, do always at their meals use a little forkes when they eat their meat. This form of feeding I understand is generally used in all places of Italy; their forkes for the most part being made of yronn or steele, and some of silver, but these are used only by gentlemen. The reason of this their curiosity is, because the Italian cannot by any means indure to have his dish touched with fingers, seeing all men’s fingers are not alike clean. Hereupon I myself thought good to imitate the Italian fashion by this forked cutting of meat, not only while I was in Italy, but also in Germany, and oftentimes in England since I came home; being once quipped for that frequent using of my fork by a certain learned gentleman, a familiar friend of mine, one Mr. Laurence Whalker, who in his merry humour doubted not to call me at table furceller only for using a forkes at feeding, but for no other cause.” The use of forks was at first much ridiculed in England; in one of Beaumont and Fletcher’s plays “your fork-carving traveller” is spoken of very contemptuously; and Ben Jonson has also ridiculed them in his “Devil is an Ass:”

The landable use of forks,
Brought into custom here as they are in Italy,
To the sparing of napkins.

Dr. Johnson asserts that among the Scotch highlanders even knives have been introduced at table only since the revolution of 1688. The English, Dutch (eork), and French (fourche) have adopted the Italian names foros and forchetta for table forks, though these names were probably used at an earlier period to denote pitchforks, flesh forks, and other large instruments, for which formerly the Low German name was used.

FORKEL, Johann Nikolaus, a German composer and author, born at Moeder, near Co-
FORLÌ

ORIGIN. I. A province of Italy, formerly part of the Papal States, bordering on the Adriatic, the republic of San Marino, and the provinces of Pesaro ed Urbino, Florence, and Ravenna; area, 718 sq. m.; pop. in 1879, 283,969. It comprises the three districts of Cesena, Forlì, and Rimini. On the coast and for some distance inland the surface is low and level, but the W. part is traversed by branches of the Apennines. The principal productions are wine, grain, hemp, flax, madder, saffron, asine, bees, and silk. No mineral of much value is found except sulphur, which is abundant. Earthquakes happen frequently. The interior suffers much from drought, while the inhabitants of the N. E. part are perhaps equally afflicted by unworthy marshes, which occupy a large proportion of the land, especially near the coast. Manufactures have made more progress than in any other part of the former Papal States. II. A city of the Forlì district, capital of the province, on the ancient Aemilian way, and on the railway between Bologna and Rimini, 38 m. S. E. of the former, and 80 m. N. W. of the latter; pop. of the commune in 1871, 38,480; of the city proper, about 18,000. It is a handsome town, surrounded by walls, and situated in a fertile plain at the foot of the Apennines, between the rivers Ronco and Montone. It is the seat of a bishop and of the prefect. It has a gymnasia and other schools, and a public library. Its cathedral contains the tomb of Torricelli. Of the nine other churches, the most interesting is that of San Girolamo, where rests the body of King Manfred. The town hall is remarkable for its council chamber, decorated with frescoes by Raphael. There are several handsome palaces, one of which, the Palazzo Guerrini, is built after designs by Filippo Juvarra. The gallery of paintings contains many fine works. The manufactures are silk ribbons, silk twist, oil cloth, woollen goods, wax, nitre, and refined sulphur. The city is said to have been founded in 207 B. C. by the consul M. Livius Salinator, and to have been named in his honor. It constituted a republic at one period in the middle ages, changed masters frequently during the wars of the Guelphs and Ghibelines, was added to the Papal States by Pope Julius II., taken by the French and made the capital of the department of the Rubicon in 1797, restored to the Roman see in 1814, and merged in the kingdom of Italy in 1860.

FORMIC ACID (Lat. formica, an ant), a chemical product so named from its being found in the bodies of ants. It is artificially prepared by dissolving sugar, starch, or tartaric acid in water, adding sulphuric acid, and distilling the mixture on peroxide of manganese. Carbonic acid gas escapes, and formic acid mixed with water distils over. It is colorless and transparent, strongly acid, of specific gravity 1.1668; its composition is represented by the formula CH₂O. Formic acid occurs in human blood, urine, spleen, flesh juice, and perspiration. In Watte's "Dictionary of Chemis-
FORMOSA (Port. Ilha Formosa, beautiful island; Malay, Pulasan or Petahoo; Chinese, Tai-tsoan, the terraced harbor), an island in the China sea, between lat. 21° 59' and 23° 15' N., and lon. 120° and 122° E., separated from the Chinese province of Fokien by a channel 90 m. wide; length 240 m., greatest breadth about 75 m.; area about 15,000 sq. m.; pop. estimated at from 3,000,000 to 8,000,000. A range of mountains occupies the eastern part, running from N. to S. through its entire length. As some of the summits are covered with perpetual snow, their height cannot be less than 12,000 ft. Among these mountains are several extinct volcanoes, and sulphur, naphtha, and other volcanic products are found. The E. coast is high and bold, and is entirely destitute of harbors. The W. shore is flat, and has some good ports accessible to vessels of moderate draft. The W. part is a very fertile, well cultivated plain. The chief productions are rice, sugar, camphor, tobacco, wheat, maize, beans, radishes, pepper, coffee, tea, indigo, cotton, flax, silk, and oranges, peaches, plums, and a great variety of other fruits. The wild animals are leopards, tigers, wolves, and deer. The ox and buffalo are used in tillage, and horses, asses, sheep, goats, and hogs are numerous. Gold is found in the mountains, and there are mines of bituminous coal in the N. part. Sulphur and salt are also found. The commerce of the island with the mainland of China is very extensive. The exports are rice, sugar, beans, sulphur, camphor, and timber. It imports salt petre, opium, and manufactured goods. Of late years it has been much visited by American ships for purposes of trade. The western and most fertile part of the island is inhabited by Chinese, who have emigrated to Formosa to escape the persecution of the last 54 or 30 centuries. They are industrious and prosperous, skilful cultivators of the soil, and enterprising merchants. The Chinese portion of the island is a part of the province of Fokien, the governor residing at Taiwang-foo, a city of about 100,000 inhabitants. In virtue of treaties four ports have been thrown open to commerce, Tanahui and Kelung on the north, and Takao and Taiwang-foo on the W. side. The E. and mountains part of Formosa is independent of the Chinese, and is inhabited by a warlike race of copper-colored barbarians, of whom the Chinese are in great dread, and with whom they are almost constantly at war. They are probably of the Malay division of mankind. They wear their hair long, have rings in their ears, and are clothed only with a piece of cotton stuff wrapped about the middle. They dwell in huts with thatched roofs and terraces 8 or 4 ft. high. They have no written language, and do not appear to have any priesthood. Their government is patriarchal, petty chiefs and councils of elders ruling them in the manner of the American Indians. Their arms are lances, bows and arrows, and a few Chinese matchlocks. In their language the island is termed Kaboski, and also Gadavia. Their number is not supposed to exceed 20,000. Some of these people have been subdued by the Chinese, and are kept in small villages in a kind of prudential servitude. —The Chinese seem to have had no settlements in Formosa before the 16th century. In 1582 a Spanish ship was wrecked there, and the survivors brought the first account of the island to Europe. About 1684 the Dutch took possession of it and built several forts and factories; but in 1689 they were driven out by a famous Chinese pirate, Coxinga, who made himself king of the W. part, and transmitted the sovereignty to his descendants, who, however, submitted in 1688 to the authority of the Chinese emperor, to whom it has since been tributary. The Chinese colonists have frequently rebelled, and in 1788 an insurrection broke out which cost the imperial government 100,000 lives and an immense expenditure of money before it was suppressed. Palmar, whose extraordinary story is so excited so much attention in England at the beginning of the last century, pretended to be a native of Formosa, and published an account of the island which was entirely fictitious. Commodore Perry, who from 1853 to 1854 was employed by the government of the United States in concluding commercial treaties with China, Japan, and Siam, called attention to the importance of Formosa; and since then scientific expeditions have been sent out by the governments of England and Prussia, to survey the coast and to explore parts of the island with a view to establishing naval stations or colonies.

FORNARINA, La (the baker girl), the appellation of the reputed mistress of Raphael, and celebrated as the model of many of his pictures. She was the daughter of a baker residing in Rome near the church of St. Cecilia, Raphael, having accidentally seen her while she was washing her feet in the river, is said to have fallen in love with her. The most famous of the alleged likenesses of her are in Raphael's great fresco of Heliodorus, in his Parnassus in the Vatican as Olio, in his "Agony of St. Cecilia," and in his "Transfiguration." His picture "La Fornarina" is supposed by Passavant to be intended for the improspirate Beatrice Fio, and the same biographer of Raphael doubts the story of the former having been his mistress.

FORNEY, John Weis, an American journalist, born at Lancaster, Pa., Sept. 80, 1817. In 1838 he became an apprentice in the printing office of the Lancaster "Journal," and in 1837 editor and joint proprietor of the Lancaster "Intelligencer;" and in 1840 he united that paper with the steamer "Pratt," at 1445 to Philadelphia, where he was long the editor of the "Pennsylvanian," one of the most decided of the democratic journals. In
1851 he was chosen clerk of the United States house of representatives, and was reelected in 1858. Meanwhile his connection with the "Pennsylvanian" had ceased, and he had become editor of the "Union," the democratic organ at Washington. He resigned this post in 1856, returned to Pennsylvania, and was chosen chairman of the democratic state committee. In January, 1857, he was democratic candidate for the office of United States senator, but was defeated by Mr. Cameron, and on Aug. 1 following began in Philadelphia the publication of "The Press," an independent democratic journal. Although he had advocated the election of Mr. Buchanan to the presidency, he became a determined opponent of his administration when the Locomotive construction of Kansas became a topic of public debate; and he was again chosen clerk of the house of representatives in the 38th congress by the republicans. During the civil war he gave a constant support to the national government. In 1861 he began the publication, in addition to "The Press," in Philadelphia, of a weekly paper in the city of Washington entitled "The Chronicle;" this also began to appear daily in October, 1862. From 1861 to 1865 Mr. Forney was secretary of the United States senate. In 1867 he published "Letters on Europe," comprising a series of sketches of travel contributed to "The Press" while abroad; and in 1873 "Anecdotes of Public Men," a collection of papers published originally in the "Sunday Chronicle" and "The Press."

FORREST, Edwin, an American actor, born in Philadelphia, March 9, 1806, died there, Dec. 12, 1872. His father was Scotch, his mother of German birth. He exhibited from an early age a taste for the stage, and when 11 years old participated in theatrical representations as a member of an amateur club, sometimes performing female parts. His first appearance on the regular stage was Nov. 27, 1820, when he acted Douglas in Horace Walpole's play of that name. His next part, played in the same engagement, was Frederick in Mrs. Inchbald's "Lovers' Vows." A protracted professional tour in the west and south ensued, in which he won considerable reputation. He essayed Shakespearean characters first in 1822, in Cincinnati, where he performed Richard III. and Othello. His first great success was achieved May 26, 1826, in the Park theatre, New York, as Othello. This led to a long engagement at the Bowery theatre, where he won some of his greatest triumphs. In October, 1829, he went to the Park theatre, where he long enjoyed extraordinary popularity. There he first acted Metamora (Dec. 18, 1829) in John H. Stone's tragedy of that name, and Spartacus (Sept. 25, 1831) in Dr. Bird's "Gladiator," both of which were great successes. In 1832 he visited Europe, and after a long tour on the continent appeared as Spartacus in Drury Lane theatre, Oct. 17, 1836. He met with success everywhere, and received many courtesies from eminent literary men and from those of his profession, particularly from Mr. Macready. In 1837, he married Catharine Norton Sinclair, daughter of John Sinclair the singer, and soon afterward returned to the United States, where he was welcomed by enthusiastic audiences. After an engagement in Philadelphia, he played at the Park theatre in New York, where he first appeared as Aylmere, May 24, 1841, in Robert T. Conrad's play of "Aylmere, the Bondman of Kent," better known as "Jack Cade." This was one of his most effective characters, in which he appeared to the best advantage. In 1845 Mr. and Mrs. Forrest returned to London. During this visit, which lasted two years, a rupture occurred in the friendly relations between Forrest and Macready, and to the zeal with which the friends of the former espoused his quarrel was due the disgraceful riot in New York, May 10, 1849, during an engagement of Macready at the Astor place opera house. Soon after Forrest separated from his wife for alleged misconduct on her part, and in 1850 counter suits for a divorce on the ground of adultery were instituted. His conduct at this time alienated from him the sympathy of the better class of people. Mrs. Forrest obtained a divorce from him, forfeiting none of her honors and legal rights, and was decreed an allowance of $8,000 a year as alimony, a decision which he contested up to the court of last resort. In 1850 Forrest purchased an estate on the Hudson river and built a house which he named Fonthill. He sold this, at a large advance on its cost, for a convent, and in 1855 bought a residence at Spring Brook, near Philadelphia, where he resided until his death. He retired from the stage in 1858, but reappeared in 1863 and again in 1867. His last engagement began on Feb. 6, 1871, in the Fourteenth street theatre, New York, during which he played Lear and Richelieu; but he was compelled by illness to retire. Three weeks before his death, he appeared in Staunton's hall, New York, as a reader of "Hamlet" and "Othello." He died of apoplexy, surviving the attack only half an hour. Forrest accumulated a large fortune, estimated at upward of $1,000,000. By his will he left a large part of his fortune to establish an institution for aged and destitute actors. His splendid library, which he had spent many years in gathering, the Shakespeare collection being said to be the finest in the world, was almost entirely destroyed by fire in his house in Philadelphia, Jan. 15, 1873. His biography, by the Rev. W. R. Alger, is in preparation.

FORSKAL, Peter, a Swedish traveller and naturalist, born in Kalmar in 1736, died in Yerim, Arabia, July 11, 1768. He studied at Göttingen and at Upsal, published a thesis in opposition to the then prevailing system of botany, and incurred the displeasure of government by a treatise on civil liberty. He was appointed to a professorship in the university of Copenhagen, and by recommendation of Linnaeus was
FORSTE

attached with Karsten Niebuhr to the scientific expedition sent to Egypt and Arabia by the king of Denmark. He set out in 1761, and during two years preceding his death by the plague collected materials for three important works descriptive of the fauna and flora of the East, which were published under the editorial care of Niebuhr.

FORSTE, a town of Brandenburg, Prussia, on an island in the Neisse, 44 m. S. by E. of Frankfurt-on-the-Oder; pop. in 1871, 7,950. It consists of the town proper and two suburbs; has a castle and two Protestant churches, considerable manufactures, and a trade in flax, horses, and cattle. There are six annual fairs.

FORST E. I. Ernst Janisch, a German painter and writer upon art, born at Münchergartenstädt, Bavaria, April 8, 1800. He studied theology, philosophy, and philology at Jena and Berlin, but afterward devoted himself to painting, and in 1823 became the pupil of Cornelius at Munich. He was employed in painting frescoes in the Aula at Bonn and in the Glyptothek and arcades at Munich till 1828, when he visited Italy. At Pisa, Bologna, and other cities he collected interesting materials for a history of Italian art, and at Padua in 1837 discovered and restored the frescoes in the chapel of St. George. He made a valuable collection of designs by the old masters, prepared guide books for Italy and Germany, and wrote numerous works, the most important being on the history of art. Among these are: Geschichte der deutschen Kunst (6 vols., Leipzig, 1831–59); Vor- schule zur Kunstgeschichte (1852); Denkmale der deutschen Baukunst, Bildnerei und Malerei (9 vols., 1855–68); Raphael (2 vols., 1869); and Geschichte der italienischen Kunst (2 vols., 1870). He also edited several of the works of Jean Paul Richter, and wrote Wahrheit aus Jean Paul's Leben, and Denkwürdigkeiten aus dem Leben Jean Paul's (Munich, 1865).

H. Friedrich, a German historian, brother of the painter, born in Jena, Dec. 24, 1811, in Jena, Nov. 8, 1868. On leaving the university of Jena in 1838, he joined, with his friend the poet Körner, in the war of independence against France, composed stirring war songs, and rose to be captain. Subsequently he was professor at the school of artillery and engineering in Berlin till 1817, when he was removed by the government, to which some of his writings gave umbrage, and he found himself likewise hampered in his functions as adjunct professor at the university. He soon became connected with prominent literary journals, visited Italy with his brother, and received in 1839 an appointment at the royal museum, with the title of court councillor. He published poems, novels, and a continuation of Chamisso's Peter Schlemihl, entitled Peter Schlemihl's Heimkehr (2 vols., Berlin, 1849). His most permanent work has been his invaluable Wahrheitskunde Columbus, and especially to Frederick the Great, and include Geschichte der Befreiungskriege 1813, 1814 und 1815 (8 vols., 7th ed., Berlin, 1865), and Neuere preussische und deutsche Geschichte (2 vols., 5th ed., 1867–9).

FORSTER, George, an English traveller, died in Nagpoor in 1792. He was in the service of the East India company, and in 1782 undertook an overland journey from India to Russia. Disguised as a Musulman merchant, and able to speak Hindoo, Persian, and the Mahrratta dialect with facility, he set out from Lucknow, travelling northward by Ferozaabed and Rampoor into the upper regions of the Punjaub. He then proceeded by Bellaspoo and Jamoo through the vale of Cashmere, which had been visited before by no European traveller except Bernier. He passed by Cabool, Candahar, and Herat, to the southern coast of the Caspian sea, and travelled thence through Russia, arriving in England in 1784. After publishing "Sketches of the Mythology and Customs of the Hindooos" (London, 1786), he returned to Calcutta, where in 1790 appeared the first volume of his "Journey from Bengal to England," &c. It was reprinted in London in 1798, together with the second volume, which was printed from his manuscript. On the breaking out of hostilities with Tipoo Saib, Forster was sent on a mission to the Mahrratta court of Nagpoor, where he died.

FORSTER, Heirich, a German pulpit orator of the Roman Catholic church, born in Glogau, Prussian Silesia, Nov. 24, 1800. He studied theology in Breslau, was ordained as priest in 1826, appointed canon of the cathedral in 1827, afterward inspector of the theological seminary and preacher at the cathedral. He opposed with great zeal the influence of Ronge, became in 1848 a member of the Frankfort parliament, attended in the same year the synod of the German bishops at Würzburg, and was made in 1853 prince-bishop of Breslau. As an author he made himself popular by his Lebensbild Diepenbrock's (2d ed., Breslau, 1859), and several other works.

FORSTER, Johann Reinhold, a German traveller and naturalist, born in Dirschau, Prussia, Oct. 22, 1729, died in Halle, Dec. 9, 1798. He was descended from an exiled Scottish border family, was educated at Halle and Dantzic for the clerical profession, and in 1758 became pastor at Nassenhuben, near Dantzic, but devoted himself especially to the study of mathematics, philosophy, and geography. In 1785 he went with his son Johann Georg as an agent of the Russian government to investigate the condition of the colony at Saratow in southern Russia, and in the following year repaired to London. He was for a time professor of natural history and of the French and German languages at Warrington, in Lancashire, and in 1772 accompanied Capt. Cook on his second voyage to the south seas, being engaged as naturalist of the expedition. After his return he published his important work on Columbus, and also "Observations made during a Voyage round the World on Physical Geography, Natural His-
FORSTER

In 1780 he was appointed professor of natural history at Halle, an office which he retained till his death. He spoke and wrote 17 languages, and was familiar with general and especially with classical literature. Among his works, besides those above mentioned, are: Liber Singularis de Byaso Antiquorum (London, 1776); Zoologia Indica (Halle, 1781); Beobachtungen und Wahrheiten (Berlin, 1798); and Geschichte der Entdeckungen und Schiffsfahrten im Norden (Frankfort, 1784). The last was translated into English (London, 1786), and contains much useful information and ingenious conjecture, together with many illustrated reflections, particularly on the English.

II. Johann Georg Adam, eldest son of the preceding, a German traveller and naturalist, born at Nassenhuben, Nov. 28, 1754, died in Paris, Jan. 12, 1794. After accompanying his father to Saratov, he studied nearly a year in St. Petersburg, and went thence to England, where he gave instruction in French and German, and translated several works into English. He went with Cook on his second voyage round the world, a narrative of which he published after his return, receiving scientific notes for it from his father, and thus elucidating the agreement by which the elder Forster was virtually prohibited from publishing a narrative. After residing in Paris and Holland, he was for six years professor of natural history in Cassel, whence in 1784 he passed to the same professorship in Wilna. He was appointed historiographer to an expedition round the world under the patronage of Catharina II. of Russia, but the project was thwarted by the Turkish war. He became in 1788 librarian to the elector of Mentz. In 1790 he accompanied Alexander von Humboldt to England, France, and the Netherlands; and Humboldt calls him his "celebrated teacher and friend, who has most visibly and successfully crowned the death in German literature of the scientific study of nature." In 1792, on the occupation of Mentz by the French, he engaged actively in support of republican principles, and in 1793 was sent to Paris as agent of the city to solicit its incorporation with France. After its recapture by the Prussians, Forster lost all his property, his books, and his manuscripts, and resolved to go to India, but died while studying the oriental languages in Paris. Besides numerous translations, his most important works are on subjects of natural history and ethnology, as Kleine Schriften, ein Beitrag zur Länder- und Völkerkunde, Naturgeschichte und Philosophie des Lebens (6 vols., Berlin, 1789-97), and Ansichten vom Niederrhein, von Preußen, Pflandern, Holland, England und Frankreich (Leipsic, 1789).

The daughter, with a critical notice by Gervinus (9 vols., Leipsic, 1845-47).

FORSTER, John, an English author, born in Newcastle in 1812, died Feb. 1, 1876. He was educated at the university of London, and was a member of its first law class. With his classmates he established the "London University Magazine," out of which grew the "Englishman's Magazine," among his contributions to which was a series of biographical articles on the "Early Patriots of England," which were subsequently enlarged into his "Lives of the Statesmen of the Commonwealth." He pursued the study of law under Chitty, and was called to the bar, but soon became a valued contributor to periodicals. In 1834 he connected himself with the "Examiner," of which he became the sole editor in 1846; and from the time of his first connection he contributed largely to every number of it, in both the departments of politics and literary criticism. He was also for four years the editor of the "Foreign Quarterly Review," and for about a year of the "Daily News," after the retirement of Mr. Dickens. He was a frequent contributor to the "Edinburgh Review" and the "Quarterly Review." A collection of his "Historical and Biographical Essays" was published in 1858. His other principal works are: "The Life and Adventures of Oliver Goldsmith" (1848), enlarged into "The Life and Times of Oliver Goldsmith" (1854); "The Arrest of the Five Members by Charles I." (1860); "Debates on the Great Remonstrance" (1860); "Sir John Eliot, a Biography" (1864); "Walker Savage Landor, a Biography" (1868); and "The Life of Charles Dickens" (1871-4). In 1855 he married the wealthy widow of Henry Colburn, the publisher. In 1856 he was appointed secretary to the lunatic commission, and was made commissioner of lunacy in 1861. William Edward, an English statesman, born at Bradpole, Dorsetshire, July 11, 1818. His father was a minister of the society of Friends, who died during an anti-slavery mission to Tennessee. He married in 1850 a daughter of Dr. Arnold of Rugby, became prominent as a Bradford manufacturer and an ultra-liberal politician, and has represented that borough in parliament since 1861. He was under-secretary for the colonies from November, 1885, to July, 1886; and in December, 1886, he was appointed one of the charity commissioners and vice president of the committee of council on education, on which occasion he was made privy councillor. In 1870 he was the chief promoter of the new education law, and in 1871 of the ballot law.

FORSTELL, L. A N.W. county of North Carolina, bounded W. by Yadkin river, and drained by its affluents; area 260 sq. m.; pop. in 1870, 3,060 of whom 2,384 were colored. The surface is much diversified, and the soil is generally fertile. The chief productions in 1870 were 86,678 bushels of wheat, 173,146 of Indian corn, 76,569 of oats, 18,088 of Irish and
The city contains a court house of stone, a high school building costing $80,000, two national banks, 10 public schools, a semi-weekly and two weekly newspapers, a monthly periodical, and six or eight churches, and has considerable trade.

**FORT DONELSON and Fort Henry, two fortifications in N. W. Tennessee, near the border of Kentucky, erected by the confederates late in 1861, and captured by the Union forces in February, 1862. The Cumberland and Tennessee rivers run nearly parallel, at a distance of about 10 m., for about 50 m. before they fall into the Ohio. Near the point where this parallel course begins, Fort Henry was built on the Tennessee, and Fort Donelson on the Cumberland. The positions were of importance as covering the passage by boats up these rivers, and as protecting the railroad communication between Memphis and Bowling Green, Ky., which was then the central point of confederate operations in this region. In February, 1862, the combined naval and military expedition was planned against these forts. Admiral Foote arrived before Fort Henry on the 6th, and commenced the attack without waiting for the arrival of the land forces. After a bombardment of an hour the fort was surrendered; but the garrison, about 3,000 strong, escaped to Fort Donelson, with the exception of about 60 who were made prisoners. Gen. Grant with about 80,000 men moved, partly by water and partly by land, upon Fort Donelson, which was now commanded by Gen. Floyd, formerly United Statessecretary of war, who had in all about 15,000 men. Next in command were Gen. Pillow and Buckner. On the 13th about half the Union force had come up, and there was sharp skirmishing, in which each side lost about 200 in killed and wounded. On the 14th the gunboats arrived, and in the afternoon opened fire, and had nearly silenced the batteries of the fort when the steering apparatus of the two largest vessels was shot away, and the fleet was forced to withdraw, with a loss of 54 men. Grant, meanwhile, was proceeding to invest the fort, when on the morning of the 15th the confederates made a sudden sally, hoping to break through the lines of investment and make their way to Nashville; but after gaining some considerable advantages they were, late in the afternoon, driven back into their intrenchments by superior numbers. The loss on each side was about 2,000 killed, wounded, and prisoners. During the night a council of war was held, in which it was decided that the fort must be given up. But Floyd declared that he would not surrender himself; he said, "You know my position with the federal; it would not do." Pillow was in favor of still trying to cut their way out; in any case, he would not make the surrender. It was finally decided that Floyd should make over the command to Pillow, who should in turn make it over to Buckner, and in the mean while Floyd and Pillow might try to save their re-
spective commands. About half of these, some 2,000, succeeded in getting across the river, and escaped. On the morning of Sunday, Feb. 16, Grant was drawn up ready to assault, when a flag of truce came from Buckner, who proposed the appointment of commissioners to agree upon terms of capitulation, and asked for an armistice until noon for that purpose. Grant replied: "No terms other than an unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." Buckner responded: "The overwhelming force under your command compels me, notwithstanding the splendid success of the confederate armies yesterday, to accept the ungenerous and unchivalrous terms which you propose." The number of prisoners was about 13,000, with 48 guns, and large quantities of small arms, ammunition, and supplies. The conduct of Floyd and Pillow was sharply censured by the confederate government, and both were suspended from their commands.

FORT DUQUESNE. See Pittsburg.

FORT EDWARD, a village and town of Washington co., New York, on the E. bank of the Hudson river, and on the Champlain canal, 40 m. N. of Albany; pop. of the village in 1870, 3,492; of the town, 5,126. The Rensselaer and Saratoga railroad and the Glen's Fails branch unite here. The village contains a weekly newspaper, two national banks with a capital of $870,000, a state bank with $100,000 capital, extensive manufactories of "congress bitters" and of turbine water wheels, three saw mills, a foundry and machine shop, a blast furnace, a brewery, two manufactories of stone ware, and one each of paper, malt, matches and brooms, razor strops, and fanning mills. The Fort Edward collegiate institute in 1873 had 15 instructors, 420 pupils, of whom 141 were females, and a library of 1,000 volumes.

FORTESCUE, Sir John, an English lawyer, who lived in the reigns of Henry VI. and Edward IV. The place and date of his birth are unknown; he is supposed to have died about 1485. In 1486 he was appointed one of the governors of Lincoln's Inn, and in 1442 chief justice of the king's bench. He was a zealous Lancastrian, and when in 1461 the fortune of war made Henry VI. a fugitive, Fortescue accompanied him to Scotland, where Henry is supposed to have appointed him chancellor of England, by which title he has been mentioned by several writers. Soon afterward the Yorkists, who at that period controlled the parliament, included him in the act of attainder which was passed by them against the king, queen, and other prominent Lancastrians. In 1464 he fled to the continent with Queen Margaret and her son Edward, and remained abroad several years attending on the royal exiles. He returned with them to England, but after the battle of Tewkesbury in 1471 he became a prisoner to the victor, Edward IV. Having obtained his pardon and liberty, he withdrew to Gloucestershire, and there passed the rest of his life in retirement. The most celebrated of his works is his treatise De Laudibus Legum Anglicae, which is written in the form of a dialogue, the interlocutors being Prince Edward and the author. The earliest edition is that of Whitechurch, published in the beginning of the reign of Henry VIII., and the latest that of A. Amos (Cambridge, 1825). The oldest translation is by Mulcaster (London, 1616).

FORT GAINES, a town and the capital of Clay co., Georgia, on the Chattahoochee river, at the terminus of a branch of the Southwestern railroad, 155 m. S. by W. of Atlanta; pop. in 1870, 785. It is a shipping point for cotton. On Colamoka creek, a few miles S. E., are several ancient artificial mounds, the largest of which is 75 ft. high, with a level surface at the summit, 80 by 30 yards in extent. From the base a broad canal, 500 yards long and in some places 12 ft. deep, extends to the creek.

FORT GARRY, Manitoba. See WINNIPEG.

FORTH, a river of Scotland, the third of that country in size, and one of the most noted for romantic scenery. It is formed by the confluence of two small streams, the Duchess and the Dhu, which unite on the N. E. slope of Ben Lomond. Thence, under the name of the Avendow or Black river, it flows E. through the fertile valley of the Laggan, shut in on either side by hills, and after receiving one or two tributaries assumes the name of Forth. From this point it begins to present the remarkable sinuosities which form its chief characteristic, now winding gracefully through a rich level country, now doubling and flowing W., again sweeping to the E., describing at times almost complete circles, and forming all along its course many beautiful peninsulas. The most notable of these windings, called the "Hanks of Forth," occur between Alloa and Stirling, the distance between which places, in a straight line, is about 9 m., while by water it is 12 m. The Teith, Allan, and Devon are its largest tributaries. At Kincardine it begins to widen into an estuary, called the frith of Forth, between the counties of Clackmannan and Fife on the north, and of Linlithgow, Edinburgh, and Haddington on the south. The frith contains several islands, and a great abundance of herring and other fish; length 50 m., greatest breadth 15 m. The general course of the Forth is E. or S. E. Its depth is from 8 to more than 87 fathoms, and its bottom is generally muddy. The tide sets up from the sea as far as Stirling bridge, a distance of 70 m. It is navigable thus far for vessels of 100 tons, and to Alloa for vessels of 800 tons. Its length to the sea, including all its sinuosities, is about 170 m., though in a direct line it would not exceed 90 m. The Forth and Clyde canal, 88 m. in length, connects those two rivers.

FORTIFICATION, the military art of preparing a place to resist attack. The means used for this purpose may be those presented by nature, as woods and rivers, or those formed by art, as shalters of earth, wood, or stone, or a combi-
nation of both. The artificial obstacles thus used are divided into two classes, permanent and temporary fortifications. When they are of a durable character and the position is to be occupied permanently or for some indefinite period, they belong to the former class; but when the position is to be occupied only for a short time or during the operations of a campaign, they are sometimes constructed in great haste and often of perishable materials, and receive the name of temporary or field fortifications. 1. Permanent Fortifications. These are essentially defensive in their nature, and their object has not changed with time. Their history, like that of men, may be divided into three principal epochs, ancient fortifications, fortifications of the middle ages, and modern fortifications.—1. Primities and Ancient Fortifications. The oldest form of fortification appears to be the stockade, which up to the end of the 16th century was still the national system with the Turks (palanka), and is even now in full use in the Indo-Chinese peninsula. It consists of a double or triple row of the trunks of stout trees, planted upright and near each other in the ground, forming a wall all around the town or camp to be defended. Darius in his expedition among the Scythians, Cortes at Tabasco in Mexico, and Capt. Cook in New Zealand, all came in contact with such stockades. Sometimes the space between the rows of trees was filled up with earth; in other instances the trees were connected and held together by wickerwork. The next step was the erection of masonry walls instead of stockades. This plan secured greater durability, at the same time that it rendered the assault far more difficult; and from the days of Nineveh and Babylon down to the close of the middle ages, masonry walls formed the exclusive means of fortification among all the more civilized nations. The walls were made so high that escalade was rendered difficult; they were made thick enough to offer a lengthened resistance to the battering ram, and to allow the defenders to move about freely on the top, sheltered by a thinner masonry parapet with battlements, through the embrasures of which arrows and other missiles might be shot or thrown against the assailants. To increase the defence, the parapet was soon built overhanging, with holes between the projecting stones on which it rested, so as to allow the besieged to see the foot of the wall and reach an enemy who might have got so far by direct missiles from above. For a similar reason towers, which at first were nothing more than square or semicircular projections, built from distance to distance in the wall itself, were devised, and subsequently were divided into stories, each of which was provided with loopholes to flank the adjacent towers and the straight portions of the wall between them. Each tower could be isolated from the straight portion of the wall adjacent by an interruption at the top, over which communication was had by a temporary bridge. These defences were found to be insufficient against the ingenuity and skill of the assailant, who by means of covered galleries of timber gradually won his way to the foot of the wall, when, by breaking his way through it or undermining it, he overcame or removed the obstruction between him and the assaulted. This led to the use of wide and deep ditches surrounding the place, forming a formidable obstacle to the modes of attack then used. When it could be obtained, the ditches were filled with water. With the decadence of the Roman empire the art of fortification, like other branches of the military art, fell into decay.—2. Medieval Fortifications. The principal works that characterize the middle ages are the castles placed in the most inaccessible positions on the lines of communication which the little inland commerce that was still carried on was obliged to traverse. They were provided with every possible device for an obstinate passive defence, being surrounded by a wide and deep ditch or moat, over which a drawbridge was the only communication to the main entrance, which was flanked by towers on the exterior, and closed with massive doors; the winding passage that led into the castle being further secured by a grated portcullis, which could be dropped at a moment's notice to arrest a sudden assault. Loopholes and machicolins in and on the walls and towers were added. In addition, there was a high interior tower, termed a keep or donjon, which, commanding the exterior, was also a watch tower over the adjacent country. This, the last defensible point, was often provided with a secret subterranean passage, having its outlet in some concealed spot on the exterior, by which succor could be introduced to the castle, or the garrison find safety in a stealthy flight. The fortifications of towns during this period partook of the same characteristics as those of castles.—3. Modern Fortifications. This begins with the invention of gunpowder and its application to military purposes. We divide it into periods according as we find the art practised in Europe. There are four marked periods, viz.: 1, during the 14th, 15th, and 16th centuries; 2, the 16th and 17th centuries; 3, the 17th and 18th centuries; 4, from the 18th century to the present time. The first was noted for the rise and growth of the bastioned system; it is supposed to have originated in Italy, and was during this period the only one used in Europe. Most of the engineers who superintended the construction of the works were Italians, and it is therefore generally known as the Italian system. The second period was noted for the modifications and improvements in this system made in Holland during its war of independence with Spain. The third period was noted for the improvements made in the bastioned system by the French. The fourth period is noted particularly for the objections made to the bastioned system and the proposal of a new one as a
a rampart surmounted by a parapet, with a ditch. The latter when dry has its sides revetted with masonry. The accompanying profile (fig. 1), which is a section made by a vertical plane perpendicular to the general direction of the intrenchment, will show the form of parapet and ditch generally used. When the place fortified is expected to contain the defenders only, called the garrison, it is termed a fort. If it surrounds a town, or is expected to contain other persons than those designed to defend it, it is called a fortress. For both cases the character of the fortification is the same. The rampart is an earthen mound raised above the natural surface of the ground upon which the parapet is placed, and serves to give the troops a commanding view over the ground exterior to the work, while it increases the obstacles to an open assault by the additional height it gives to the scarp. The top surface in rear of the parapet, called the terreplein, affords a convenient and secure communication for the troops. The form and dimensions of the rampart are so arranged that it shall afford cover to the troops and to the armament, and facility for firing over it by the
defence both with artillery and small arms. The ditch serves the double purpose of increasing the obstacles to be overcome by the enemy and furnishing the earth to form the rampart and parapet. To give strength and durability, the faces are revetted with walls of masonry, called respectively scarp and counterscarp walls. When dry, the ditch is made from 20 to 80 yards wide, and receives a slight slope toward the middle, where a small drain called a cunette is dug to receive the drainage and keep it dry. When wet, the ditches are wider. Scarp walls are of three kinds: 1, the ordinary retaining wall, strengthened by counter forts; 2, the same with relieving arches; 3, detached in part or wholly from the rampart. They are usually made not less than 80 ft. high, which is sufficient to prevent an escalade if the defence offer an ordinary resistance. Counterscarps are ordinarily of the first and second class, and are generally from 18 to 24 ft. high. The height of the interior crest of the parapet above the exterior ground is called the command, and its height above the bottom of the ditch the relief. The covered way is an open passage bordering the ditches, forming a continuous communication around the work, sheltered from the enemy by an embankment high enough to cover the troops using it. This embankment is arranged like an ordinary parapet, having on the exterior a gentle slope or glacis. Slopes and dimensions of profile are as follows: scarp and counterscarp slopes, \( \frac{1}{3} \) (or 1 base to 34 altitude); exterior slope, \( \frac{1}{3} \) (45°); superior slope, \( \frac{1}{4} \); interior slope, \( \frac{1}{4} \); banquette slope, \( \frac{1}{4} \); rampart slope, \( \frac{1}{4} \); terrepleins, 8 ft. below interior crest; berms, 2 ft.; thickness of parapet, 25 ft.; height of interior crest above banquette tread, 44 ft.; width of banquette treads, from 2 ft. to 6 ft.; general width of terreplein, 48 ft. The continuous line enclosing the place is called the enceinte or main enclosure. Although a great diversity of figures may thus be presented by the outline of the work enclosing the place to be fortified, they may all be classified under four heads, to each of which engineers have applied the term system of fortification. These four classes are: 1, circular; 2, polygonal; 3, tenailléed; 4, bastioned. The circular system consists of a work the plan of which is circular or curved. The polygonal is when this plan is a polygon with salient angles only, or where the reentrantings are very slight. The tenailléed is where
the plan consists of a tenailed line, the retrenching angles being between 80° and 100°, and the salient angles being less than 80°. The mentioned consists generally of two faces and two flanks, the extremities of the flanks being connected by curtains. A work consisting of an enceinte alone would restrict the garrison to a passive defence, and would be more or less exposed to surprise. To provide against the latter, and to enable the garrison to make a more active defence by operating on the exterior of the place, engineers have devised certain exterior defences called outworks without the enceinte. Others have been placed within the enceinte, called interior works, more particularly for the purpose of defending any breach that may be made in the main work. When an interior work is detached from the enceinte and is organized to receive the garrison and rely on its own resources after the main work has fallen, it is called a citadel. Owing to the form and height of the parapets, its fire can take effect only at some distance beyond it. The enemy having gained the ditch will not be exposed to the fire from the works unless some arrangement has been made for this emergency. Such points where the enemy can find shelter are called dead angles or spaces. These may be removed either by arranging the lines of the work with this object in view, as in the bastioned system, or by means of auxiliary works, termed caponnières, scarp galleries, counterscarp galleries, &c., as in the polygonal system.—Bastioned System. If, supposing the place enclosed by a bastioned system, we connect the salients of the bastions by straight lines, these will form a polygon of as many sides as there are bastions. If the curtains be produced, they will form a second polygon within the first. They are respectively called exterior and interior polygons. Either of these may be taken as a general outline to enclose the place to be fortified. The exterior polygon is generally used, and sometimes called the polygon of the fortification. It may be regular or irregular. We will suppose the site to be fortified to be level or approximately so, and the polygon to be regular. There is an intimate relation between the length of the side of the polygon and the lengths of the lines of the fortification, which will be referred to hereafter. Assume the length of a side, called the exterior side, to be 380 yards. To lay off the lines of the work, some one line must be selected as the directing one. In permanent fortifications the line of intersection of the front face of the scarp wall with the top or upper surface of coping is taken, and receives the name of magistral. In giving the method for locating the lines on one side or front, all the information necessary for the entire work will be known. Bisect the side of the polygon by a perpendicular, and lay off on it inside the polygon a distance equal to \(\frac{1}{4}\), \(\frac{1}{2}\), or \(\frac{3}{4}\) of the side, according as the polygon is a square, a pentagon, or a polygon of a greater number of sides. In this particular case lay off \(\frac{3}{4}\), or 68-75 yards; this will be the instance for the hexagon or any greater polygon. Lines drawn through this point and the extremities of the exterior side determine the directions of the faces and the lines of defence. We may assume the lengths of the faces and then deduce the flanks and curtain, or assume the curtain and deduce the others. If we take the first plan, we lay off from the salient a distance equal to \(\frac{3}{4}\) of the exterior side, which gives us the length of the face and the positions of the shoulder angles; then draw the flanks, making an angle of 110° with the lines of defence or 100° with the curtain. Lay off on each flank a distance of 50 yards and join their extremities by a straight line. This will give the curtain, 140 yards in length. This length of curtain admits of the flanks having a relief of 44-60 ft., and at the same time thoroughly sweeping the ditch in front of the curtain by the fire from them. Let X X, Y Y, Z Z be the exterior side; then following the foregoing construction, we have X Y the magistral of the face, Y Z of the flank, and Z Z the curtain. The line X Y produced to Z, the opposite extremity of the curtain, is the line of defence. From their positions it is evident that an intimate relation exists between these lines; any change in one affects all the others. The angle at X is called the salient angle of the bastion; Y Z, the shoulder angles; Y Z Z, the curtain angles; and X X Y, the diminished angle. From an examination of the figure, it is seen that we have now laid out the plan of the enceinte. The heavy line parallel to the one constructed is the interior crest. Although drawn parallel in the figure, it is not absolutely so in practice. To explain these details would extend this article to a degree that is not admissible. The other lines are easily understood by looking at the profile (fig. 1) taken on m' m' n' n'. Communication from the interior to the exterior is made by a postern through the middle of the curtain that comes out 6 ft. above the bottom of the ditch. A wooden ramp is used to descend from the postern to the ditch. In front of the curtain is placed the tenaille O, its form being a curtain parallel to that of the enceinte with two wings the scarp of which are on the prolongations of the scarps of the faces. It is separated from the curtail by a ditch 18 yards wide, and from the flanks by ditches 11 yards wide. It is intended to mask the masonry of the curtain and flanks and cover the postern. It is arranged for defence having its fire to bear upon the ditches. The object of the double caponnière P is to afford a secure communication across the ditch, and to be a defensive work for the main ditch. The object of the demi-lune G is to secure the gates of the place from surprise, to mask the flanks and curtains of the enceinte from the enemy's batteries, and to give cross fires on the salients of the bastions. They favor sorties by the strong reen-
terings made in the front. The cuts K K are made to isolate its extremities from the salient portion, and prevent the enemy from driving the defence from the redoubts of the reentering places of arms if he should gain possession of the demi-lune. The demi-lune redoubt J is for the purpose of sweeping at close range the terreplein of the demi-lune, and render its defence more obstinate by the support it receives from the redoubt. The covered way D D, bordering the ditches of the main work and demi-lune, forms a secure communication around the entire work. It is an indispensable outwork, and is of the highest importance where an active defence is to be made. Traverses, a, a, are placed at intervals to protect the troops in it from ricochet fire, and are arranged for defence. The covered way is broken forward in the reentering angles for the purpose of enlarging the covered way at these points, and producing a flanking arrangement by which the glacis can be swept and a cross fire brought to bear upon the ground in front of the salients. Within this enlarged space, or reentering place of arms, a redoubt M is placed. Its object is to strengthen the covered way and sweep with its fire the enemy's establishments on the glacis of the demi-lune. Sometimes a redoubt is placed in the salient place of arms. The surface of the embankment of the covered way is made, from the interior crest to the exterior, with a gentle slope. The principle to be attended to in arranging these glacis planes is, that they should all be swept by the artillery fire of the works in their rear, and by the musketry fire at least of the bastion face. From what has been said, it will be seen that in this system, when the relief and plan are suitably arranged, the fortification possesses the advantage of having its ditches thoroughly swept from within the main work itself, of bringing a cross and flank fire to bear upon the approaches on the salients, and furnishing a strong direct and cross fire upon the
ground in advance of the curtains and the faces of the bastions.—The bastioned system came into existence after the application of gunpowder to military purposes. The precise date and name of its author are not known. The best authorities give as the date of its origin the close of the 16th or the beginning of the 17th century. The system as it appeared in Italy, and as practised by the Italian engineers of that date, was soon adopted throughout Europe. In its application in the different states, it was varied and modified in different degrees. These variations and modifications were due to the discussions among the profession as to the best method of combining the parts, of adapting it to the natural features of the country where applied, and to the natural characteristics of the people. From these arose the schools known as the Italian, Dutch, French, Spanish, German, and Swedish. The Italian school was characterized by very small bastions connected by very long curtains, with the flanks perpendicular to the curtains, and no outworks. In some cases, a small and very obtuse bastion was placed at the middle of the curtain. The ditches were about 33 yards wide and 24 ft. deep. The defects of this plan were soon felt, and an improvement was made by shortening the curtain, enlarging the bastions, and introducing a covered way, with a tête de pont to cover the communication across the main ditch at the middle of the curtain. In the Netherlands, the low country, want of time and money, and presence of water on or near the site, led to decided changes in the system. From the nature of their struggle, their defensive works were based upon a strictly passive defence. The characteristic features of the Dutch school were wide ditches filled with water, low ramparts without revetment walls, an enceinte often within one, and numerous outworks. The French school was characterized by a combination of the best features of the Dutch and Italian schools. Retaining the profile of the latter, the outworks of the former were added. It is to this school that we are indebted for the rules and principles of the bastioned system. Scientific and systematic fortification may be said to date from Vanbelt, so perfect are his works in comparison with those of his predecessors throughout Europe, in the arrangement of the details, the proportions of the lines, and the adaptation of the system to the requirements of every locality. The characteristics of the Spanish school are the increase in dimensions of profile and height of scarp, with interior intrenchments, and often a bomb-proof keep, the object being to render the defence more obstinate. They made free use of detached works but, like the main work, they were generally organized for a strictly passive defence, depending upon their own resources rather than cooperation from the main or other works. They frequently omitted the covered way. The works of the German school differ but slightly from those of the French and Italian. In some fortresses, the adoption of casemated batteries, which in recent years have formed so important a part in their works, was the distinguishing feature. This school reckons a number of original writers on fortifications, among the most noted of whom are the celebrated Albert Dürer, Speckle, and Rümpler. Many of the characteristic features of the French school were suggested by Speckle many years before they were adopted in France. Swedish engineers paid special attention to covering the faces of their works from enflaming fire. They made free use of casemated batteries, having them often in several tiers. They also arranged their interior parts so that each should contribute to the defence of the others and be capable of an independent resistance.—Polygonal or German System. This system has been proposed by several engineers of distinction, but its most ardent advocate has been the French engineer de Montalembert. The leading features of this system are as follows: 1. To occupy the principal points of the position to be fortified that are liable to be attacked by works which shall contain within themselves all the resources necessary for a vigorous defence; these works to be placed in reciprocal defensive relations with each other, but so arranged that the falling of one of them into the hands of the enemy will not compel the loss of the others, nor the surrender of the place. These are called independent works. 2. To enclose the space in rear of these by a continuous enceinte; or connect them by long curtains; or employ them as a system of detached works in advance of a main work, for the purpose of forming capacious intrenched camps. The enceinte, when used, to be polygonal in plan with a revetted scarp, and so arranged with the independent works as to sweep in the most effective manner by their fire the approaches of the enemy, both near and distant. 3. To provide the most ample means for an active defence by covered ways strengthened by casemated redoubts, and ample communications between them and the main work for sorties in large bodies. 4. To shelter the artillery from the enemy's fire, and so arrange it that it shall be superior to that of the besiegers at any period of their attack. In this system the plan of the enceinte and of any independent work when detached is polygonal, the ditches of which are flanked by caponnières, which are casemated structures of two and sometimes three tiers of fire; or the front may be either slightly tenalled or of a bastion form, with short casemated flanks to flank the main caponnière; the main flanking arrangement for the ditch being the caponnière, a work exterior to the enceinte. The caponnière in many cases extends across the ditch, projecting into the outwork on the other side, and also into the interior of the enceinte. It serves in this case three purposes: to flank the ditch; as a
redoubt for the outwork; and as an interior work to sweep the terrepleins of the enceinte. Where the caponnière is not flanked from the main work, by scarp galleries or batteries, other arrangements are devised, as projecting wings, or small caponnières attached to the main one. Free use of casemated defences is made in this system; also, systems of mines for interior as well as exterior defence are arranged in connection with the counterscarp galleries. The profile differs but slightly from that used in the bastioned system. The use of detached and semi-detached scarps affords facilities for arranging corridors or open passages around the works, and opportunities for loopholes. To sum up, this system proposes to flank the ditches not from the work itself, but by auxiliary works; to provide an overwhelming artillery fire protected in defensive casemates; and to organize strong permanent works within and independent of the enceinte, which are to serve as a secure retreat for the garrison when forced to give up its defence. The advantages of this system, compared with the bastioned, may be stated as follows: 1, that the interior space enclosed by equal lengths of enceinte is greater than in the bastioned; 2, that the faces of the work, from the greater obuseness of the salient angles, are less exposed to ricochet fire; 3, that the fire of the faces has a better bearing on the distant defence; 4, that, requiring fewer points on a given extent of line to be fortified, there will be fewer flanks, and more artillery will be disposable for the faces and curtains; 5, that the besiegers will be forced to a greater development of trenches for the same number of points. On the other hand, the system is deficient in the strong concentrated cross fires that exist in the bastioned system in front of the salients. The flanking arrangement of the ditch being an exterior work, as soon as its fire is silenced the main work will be exposed to an escalade. It is further objected to this system that the numerous works of masonry can be easily ruined by distant batteries of heavy calibre, especially when weakened by loopholes and casemates, as is the case in the caponnières and defensive barracks; that the distribution of troops and material of war throughout the independent works deprives the defence of that unity and concert of action so necessary for a successful resistance; that the works are more costly from the greater amount of masonry used; and finally, that it is imprudent to abandon a system that has been tested for one that does not possess this advantage. In the discussions which have taken place upon the merits of the two systems between engineers throughout the world, of the exaggeration of the defects and the depreciation of the advantages of the system analyzed seem to be the governing principles. The truth is that both possess great merits, and due credit should be given to each system. The fragility of masonry and the ease with which it can be destroyed by heavy projectiles, the increase in calibre of the cannon used and in accuracy of firing, must naturally incline engineers to limit its employment as much as possible; reserving its use for positions where it will not be exposed, or is so covered that nothing can be feared from the besieger's guns.

It is unnecessary to dwell here upon the circular and tenalled systems. They observe the general conditions that we have given as common to all systems of permanent works. The advantages they possess and the objections that are made will be apparent to those who have carefully examined the bastioned and polygonal systems.—General Remarks. So far in the consideration of fortifications we have confined ourselves to the first three conditions and an allusion to the fourth. No work would be complete without bomb-proof shelters for the troops and magazines, whatever be the system adopted. The details of these works must be looked for in books treating specially of these constructions. The fifth general condition involves the use of water when it can be obtained, the character of the soil, the use of mines, and the arrangement of the parts of a work when placed on an irregular site. The last case calls largely upon the skill and the science of the engineer. When the terreplein of a work is arranged so as to shelter the troops and matériel by the parapet or by traverses from the fire of the enemy who occupies ground higher than the site of the work, it is said to be defiled from that fire. This fire may be direct or in reverse. These problems of direct and reverse defilement are among the most important in the profession, and demand a minute and laborious study of the natural features of the position in relation to the defence. No rules but of a very general character can be laid down for the guidance of engineers in such cases. We may conclude that in order to arrange the different parts of a fortification and combine them properly, a knowledge of the means which may be employed to fulfil the general condition before given, and a suitable adaptation of these parts to the natural features of the position, are necessary. The utility of permanent fortifications has been seriously called in question; but it is enough to say that Napoleon, the archduke Charles of Austria, the duke of Wellington, and others have all regarded them as of great utility and of absolute necessity for a country. It is probable that no great general has ever entertained a different opinion from them on this subject.—The selection of the points to be fortified will be influenced by the natural features of the country. As a rule, those points known as strategic points are the ones selected; but it is, in such cases, which may be considered as the principal objects to be gained by an enemy, or whose occupation would be of manifest advantage to him. The capital of a country is such a point from its importance. The effect of seizing the capital
would be to discourage the nation and to cause a large portion of the people to give up all hope of a successful defense against the enemy. A position that is the key of several important communications, like Atlanta in Georgia, where several railroads centre, or on some river, as Cairo at the junction of the Ohio and Mississippi, would be an example. In mountainous regions, the entrance of defiles, at points where several valleys branch, or at the junction of roads, are examples. Points like these are the ones to be fortified when the intention is to put the country in a state of defence against an invading force; but as in the United States there is little probability of invasion in any case except along the seacoast, the attention of American engineers has been directed to securing the principal harbours, naval stations, and commercial cities. The works for this purpose have been arranged and armed with guns and mortars of the heaviest calibre, with the design of excluding the enemy's fleet from the use of the harbor or roadstead in their vicinity. Hence these works exhibit some peculiarities of construction at variance with the general rules already laid down for permanent works. The cardinal maxim adopted by engineers is that all masonry should be masked from the distant batteries of the enemy; that no masonry should be exposed. When this rule is violated there are reasons for it which an examination of the site will explain. Earth or sand, or a mixture of them, is the material used for parapets and for the masks. An examination of fig. 1 will show that the glacis of the covered way completely masks the scarp wall of the main work from the enemy's fire. In addition to this other works are often used. In cases where, in order to get the necessary amount of fire, greatly exposed masonry has heretofore been resorted to, it is probable that wrought iron will hereafter have to be used. Experiments are in progress to ascertain the best method of substituting it for stone in those parts; and it was used to some extent in casemates by Gen. Totten, late chief engineer of the United States army. Its expense is the present chief objection. — The casemates and embrasures used to protect the artillery and the men serving it weaken the walls and limit the field of fire. Various experiments have been proposed to secure such protection without using embrasures. One of these is the project of having the gun exposed above the parapet only at the moment of firing, the recoil of the piece causing it and the carriage to descend by inclined rails or other devices to a level below the interior crest, and the piece when reloaded being raised to its former position in battery by the aid of a counterpoise attached to the gun or carriage, which has been lifted to a certain height by the gun in its descent to the lower level. Several ingenious plans have been proposed to carry out this principle. Among the first was that of Gen. De Rusey, colonel of the United States engineers, who made a model showing this principle about 1840. The best known plans, however, are the gun carriages devised by Maj. Moncrieff of the English militia, and that of Major King of the United States engineers. These carriages have been tested by actual experiments, and show that the principle is capable of practical application. Maj. Moncrieff's project has been suggested for sunken batteries, the gun and carriage sinking into a pit prepared for the purpose. Maj. King's is intended to apply to existing works. To complete the fortification for the defence of harbors or rivers, the fifth general condition must be extended to include a good system of torpedoes. (See Torpedoes.) — All arrangements made for the defence with musketry and artillery belong to what is known as the armament. That for small arms is complete when the slopes of the parapet and the position of the banquette are arranged. The final defence of the work depends upon the effective use of these arms. For artillery the arrangements may be barbette, embrasure, or casemate. The first is a construction by means of which the piece fires over the parapet; the second, an opening for a gun in the parapet, exposed to vertical fire; and the third, an opening protected from vertical fire. The calibre, the kind of guns or mortars, and their positions in the work, will depend upon the object of the fortification, and the kind of attack that it is exposed to.

II. Temporary or Field Fortifications. These are of two kinds, those used in the defence of a position, and those used in the attack of a position or place. They might be classed as defensive and offensive works. The main objects of these works are to afford a shelter from the enemy's fire, an obstacle to the enemy's progress, and means for the assailed to use their arms with effect. The general term intrenchments is applied to all field works, and a position strengthened by them is said to be intrenched. The general principles involved in permanent fortification are applicable to these defences, the only difference being in degree. The parapet differs from the parapet represented in fig. 1 only in thickness and in resting on the natural surface of the ground instead of on a rampart. The thickness is regulated by the material used, the kind of attack, its probable duration, and the length of time at the disposal of the assailed to throw up the work. As a general rule, its thickness is one half greater than the depth of penetration of the projectile into the material used. If the projectile from a field gun at a distance of 440 yards, firing against the work, can penetrate 6 ft., the thickness must not be less than 9 ft., measured horizontally between the interior and exterior crests. The height of the interior crest above the ground within the work must not be less than 6 ft. 6 in. We assume it ordinarily to be 8 ft., and limit its greatest height to 12 ft., owing to the difficulty of throwing up a work with this relief in a reasonable length of time, with the ordinary means.
at hand. Works of a greater command than
this have been constructed; the length of time
consumed in building these, their importance,
and the many interior arrangements devised
for the safety and comfort of the troops using
them, cause them to approach more nearly in
detail works of a permanent character; and
they have been called for these reasons semi-
permanent works. The ditch that surrounds
the work affords the earth for the parapet, and
should be wide and deep enough (not less than
12 and 6 ft.) to form a considerable obstacle
to the assailants. The slopes are the same as
given for the permanent work, viz.: superior
slope, \( \frac{1}{2} \); exterior slope, \( \frac{1}{4} \); and interior slope,
\( \frac{1}{2} \). The sides of the ditch are not ordinarily
revetted; if so, however, it is by some mate-
rial of a perishable nature, as plank, timber,
&c. The interior slope is revetted by soda, or
some material hastily gathered for the pur-
pose, as logs, boards, fascines, gabions, &c.
The banquette is placed 4 ft. 8 in. below the
interior crest, and is from 2 to 4 ft. wide. It
is connected with the ground by a slope of \( \frac{1}{4} \),
which is sometimes replaced when interior
space is needed by steps whose tread is 13 in.
and rise 9 in. In laying out the plan of the
work the line of the interior crest is adopted
as the directing line. The plans of these works
vary according to their object and site. Sup-
posing the site level or approximately so, the
relief is generally uniform throughout. Such
works may be classed into three kinds: 1,
those that are arranged to sweep only the
ground in their front; 2, those that do the
same for their flanks in addition; 3, those
that are arranged to fire on all sides. A work
consisting of a simple straight line, or of two
faces, the rear, called the gorgo, being open, is
an example of the first class. This is called a
redan, and is used in front of a defile, at the
exit from a bridge, or for the defence of an
outpost, where the attack is expected only from
one side. A covering of a lunette, or a small
lunette, is an example of the second class, and
is hardly ever used alone. In this case the
attack is not expected from the rear, but an
assault made on the flanks would be liable to
work around and carry it at the rear. Both
in this case and the first, when they are used
alone, the gorgo is closed by palisading or a
stockade. A work of a polygonal figure, with-
out re-entering angles, in plan as a square or
rectangle, arranged to fire in all directions, is
used when liable to be attacked on all sides.
It is called a redoubt. The ditch of a redoubt
cannot be swept by the fire from the work it-
self; therefore the bastioned trace has been
sometimes used, but the great length of time
required to construct it prevents its general
adaptation. When these works are joined to-
gether or placed along a given front with in-
tervals, it is called a line, or a line with intervals.
A number of redans joined by curtains is a simple case of a continued
line. If the line be formed entirely of redans,
it is called a tenaille line. The usual plan of a
line with intervals is to place lunettes and
simple redoubts, or either, on a given front at
distances apart from 250 to 500 yards, and in
rear of them, opposite the intervals, redans or
other field works, arranged to sweep by their
fire the ground in front of the salients of the
first line. In field works all accessory de-
fences, both artificial and natural, should be
freely used. On irregular sites it will not be
possible to preserve the relief uniform, and the
same problems for defilement will be met with
as in permanent works. The only general
rules that can be laid down are to lay out the
principal lines so as to obtain a direct and cross
fire on the approaches of the enemy, and to
place them as nearly as practicable parallel to
the general crests of the commanding heights,
so that the enemy will have only a direct fire
on them. Where the defilement would in-
volve considerable labor in raising the interior
crest to intercept the fire, traverses should be
resorted to in preference.—Field works re-
quire to be simple and easy of construction.
All lines and fronts should have their flanks
protected by natural obstacles if possible. The
relief of a work should be obtained by its
position and not by the construction of em-
bankments, and if possible the necessity of de-
filement should be avoided. The class of works
already named will require several days and
often weeks to construct. In an active cam-
paign they are freely used, especially in the
defence of defiles, the crossing of rivers, de-
pots of supplies, intrenched camps, &c. An-
ticipating the movements of the enemy, time
enough may be had to finish them, or at least
to put them in such condition as to render
them useful for defence if an attack be made.
When, however, an engagement is imminent,
or has begun, in the absence of such works,
resort is had to what may be called hasty in-
trenchments for opposing the enemy’s advance;
sheltering troops, forming the rear, as parts of a
line. These are shelters that may be executed in a short time, say within an hour,
certainly not more than three hours. They
are not limited to defensive positions, but are
used on the battle field itself. By excavating
trench 2 ft. wide and 14 ft. deep, throwing
the earth to the front, building up the slope
next to the trench as steep as possible by
using clods of earth, sods, fallen trees, fence
rails, &c., shelter will be given to two ranks,
one kneeling in the trench, the other lying flat
in rear of it. By placing a man at every 4
ft., the trench can be dug in 30 minutes.
This trench can be widened to 4 ft. in 20 min-
utes more, when both ranks can enter it; in
20 minutes more it may be widened to 7 ft.,
increasing the thickness of the mound of earth
between the men and the enemy, and allowing
freedom of movement for the fronts of the sol-
diers. Thus it is seen that in an hour good
shelter can be obtained by active troops.
These are known as shelter trenches, and upon
being further strengthened form what we call rifle trenches or pits. In these the trench at both ends is 5 ft. wide and 8 ft. deep; the earth is thrown forward far enough to allow the natural surface of the ground to act as a banquette, the embankment being 4 ft. 6 in. high. These expedients have entered largely into the operations of recent wars, but in no country and at no time have they been used with greater success or more generally than in the late civil war in the United States. Whenever an army halted in the presence of the enemy they immediately began to intrench themselves, before eating or resting. The difficulty was to get them to wait until a proper line was selected. This custom has not been confined to modern times. The Roman legions intrenched their camp every night, and remains of many of their intrenched camps are yet to be seen.—The use of field works runs back to the remotest times. The nation that has ever played a most important part in the operations of war. Prominent examples are Frederick the Great’s camp at Bunzelwitz, Wellington’s lines at Torres Vedras, the French lines at Weissenburg, the Austrian intrenchments in front of Vienna in 1848, and the lines of field works around Vicksburg, Nashville, Petersburg, Richmond, and, most prominent of all, the city of Washington.—For the offensive works used in siege operations, see SIEGE.—There are numerous works on fortification, but full information may be obtained from those of Prof. D. H. Mahan, “Military Engineering: Part I., Field Fortifications, &c.; Part II., Permanent Fortifications” (2 vols. 8vo., New York, 1855—7), and Gen. A. von Zastrow, “Geschichte der beständigen Befestigung” (2 vols., Leipzig, 1854; translated into French, “Histoire de la fortification permanente,” 2 vols. 8vo., Paris, 1856). FORT JACKSON. See New Orleans. FORT MADISON, a city and the capital of Lee co., Iowa, on the Mississippi river, 12 m. above the lower rapids, and 17 m. S. W. of Burlington, on the Chicago, Burlington, and Quincy, and the Burlington and Southwestern railroads; pop. in 1850, 1,509; in 1860, 2,986; in 1870, 4,011. It is built on ground rising gradually from the river. The houses are for the most part of brick, and are surrounded by grounds tastefully arranged, and shaded by ornamental trees. The city is the site of the Iowa state prison, a limestone structure containing 318 cells, and furnished with extensive workshops. The number of convicts in 1878 was 284. The court house and county jail are substantial structures. The river is crossed by ferries. Fort Madison is a place of considerable trade, and its manufactures are important, including hardware and machinery, lumber, flour, brick, woollens, wine, &c. There are five hotels, four public halls, a public library, a theatre, and a national bank. The Fort Madison academy has an average attendance of 100 pupils. The city contains five public schools, two weekly newspapers, and nine churches.—Fort Madison was first settled in 1835, and was incorporated as a town in 1856. It derives its name from a fort erected in 1808, and named in honor of James Madison. FORT ROYAL, or Fort de France, a seaport of the French West Indies, capital of Martinique, situated on a deep and well sheltered bay on the W. side of the island; pop. about 12,000. It is defended by a fort which commands both the town and the harbor, is the residence of the French governor and of a bishop, and contains, besides the parish church and government offices, a prison, hospital barracks, and an arsenal. The streets are straight and spacious, and the houses in general well built. The town was founded in 1672. In 1859 it was almost wholly destroyed by an earthquake, in which more than 500 lives were lost. FORT ST. DAVID, a town of India, on the Coromandel coast, in South Arcot, 3 m. N. of Cuddalore, and 12 m. S. W. of Pondicherry. It was formerly well fortified. The town was called Tengapatam till 1691, when it was purchased by the East India Company. It withstood a siege by the French in 1746, and from that period remained for 12 years the capital of the British possessions in this part of India. In 1758 the French under Lally besieged it again, captured it after a short resistance, and destroyed its fortifications. It is now in ruins. FORT SCOTT, a city and the capital of Bourbon co., Kansas, on the Marmiton river, a branch of the Osage, about 100 m. S. of Leavenworth; pop. in 1860, 262; in 1870, 4,174. The Missouri River, Fort Scott, and Gulf, and the Missouri, Kansas, and Texas railroads intersect here. Bituminous coal is abundant in the surrounding country. Manufacturing industry is little developed, but there are three flouring mills, a planing mill and furniture factory, carriage and wagon factories, cement works, foundry and machine shops, a castor oil factory, cement pipe works, and a barrel factory, employing in the aggregate 144 men. Two national banks have been established, with a capital of $160,000. The city contains five public school buildings, one of which cost $60,000, and has a normal department. One daily and two weekly newspapers are published. There are nine religious societies. Fort Scott was established as a military post in 1842, and was incorporated as a town in 1855. FORT SMITH, a city of Sebastian co., Arkansas, on the right bank of the Arkansas river, at the head of steamboat navigation, about 180 m. W. N. W. of Little Rock, and near the boundary of the Indian territory; pop. in 1860, 1,582; in 1870, 2,297, of whom 686 were colored; in 1878, 8,000. The situation is beautiful, and commands an extensive view of the Arkansas, the land, interspersed with hills and dales, rising gradually from the river. The business portion of the city is mostly built of brick and stone. The outskirts are lined with gardens, amid which are handsome residences.
The surrounding country is rich in timber and coal. The Little Rock and Fort Smith railroad was completed in 1873 to Clarksville, 60 m. distant. There are several manufactories, including a large flour mill, a planing mill and machine shop, two breweries, and two wagon factories. There are Lutheran, Baptist, Methodist, and Catholic schools, three public schools, of which one is colorless, and nine churches. Four weekly newspapers are published, two of which also issue tri-weekly editions. The United States courts for the western district of Arkansas are held here. The town was laid out in 1838 on land adjoining the reservation belonging to the government post of that name.

**FORT SUMTER.** See Sumter, Fort.

**FORTUNA.** In Roman mythology, the goddess of chance, both happy and unhappy, called by the Etruscans Nurela. Among the Greeks she was known under the name of Tyche, as the daughter of Oceanus, according to Hesiod, and as the sister of the Mora or Parce, according to Pindar, and had her temples at Smyrna and other cities. She was worshipped in Italy in the earliest times by the Etruscans at Volisini, by the Latins at Fruneste, and by the Volsci at Antium, where she had a temple, two statues, and an oracle, whose responses were highly valued. She was diversely represented as blind, with wings on her feet, which she was believed to lay aside when entering Rome, with a crescent on her head, a helmet, cornucopia, or globe in her hand, and resting on a wheel. The town of Palestrina is built chiefly on the site of the temple of Fortuna.

**FORTUNATE ISLANDS.** See CANARY ISLANDS.

**FORTUNATUS.** The title of a collection of popular tales, the earliest known publication of which took place in Augsburg in 1509, though it includes fairy lore and popular legends of an earlier period. They teach that wealth is not sufficient to secure permanent happiness, which is illustrated by its ultimately ruining Fortunatus and his sons, who were in possession of boundless riches and of a talisman enabling them to attain all their desires. The conception was long supposed to be of Spanish or English origin, but the Germans claim it. In 1530 appeared a new edition entitled *Fortunatus von seinem Sechel und Wunschschatzlein*; and since that time numerous editions and translations have appeared in the chief European languages. It has been dramatized in German by Hans Sachs, and in English by Thomas Decker. The earliest edition is reproduced in Simrock's *Deutsche Volksbücher* (3 vols., Frankfort, 1846), and the subject is a favorite theme of German poets, and of exponents of medieval literature.

**FORTUNE, Robert.** A Scottish botanist, born in Berwickshire in 1813. He was brought up as a horticulturist, and having procured employment in the botanical garden of Edinburgh, attended the lectures of the university professor. He was afterward employed in the botanical gardens at Chiswick, and was appointed by the London horticultural society as collector of plants in northern China, which the peace of 1842 had just thrown open to Europeans. His "Three Years' Wanderings in the Northern Provinces of China" (2 vols. 8vo, 1847), published soon after his return, affords full information of the horticulture and agriculture of the Chinese. After superintending for several months the gardens of the apothecaries' company at Chelsea, he again departed in the latter part of 1848 for China, under the auspices of the East India company, to examine and report upon the nature and method of cultivation of the tea plant, and to collect its seeds and introduce its culture into northern India. After an absence of more than three years, he returned to England and published "Two Visits to the Tea Countries of China" (2 vols. 8vo, 1852). He soon made a third tour to the same country, the results of which were given in his "Residence among the Chinese, Inland, on the Coast, and at Sea, being the Third Visit from 1853 to 1856" (8vo, 1857). In 1857 he was employed by the United States patent office to visit China to collect the seeds of the tea shrub and of other plants, with a view to their cultivation in the United States. He proceeded from England by the overland route directly to the tea districts in the middle and northern provinces of China, where he remained until March, 1859, shipping a large quantity of seeds to the United States. He returned to England in May, and has since published "Yedo and Pekin" (London, 1869).

**FORTUNE, Marianna.** See supplement.

**FORT WAYNE, a city and the capital of Allen co., Indiana, on an elevated plain at the confluence of the St. Mary's and St. Joseph's rivers, which here form the Maumee, and on the Wabash and Erie canal, 103 m. N. E. of Indianapolis; pop. in 1840, 2,080; in 1850, 4,298; in 1860, 10,886; in 1870, 17,718, of whom 5,041 were foreigners. Most of the business blocks and many of the residences are of brick. Among the public buildings are the court house, which cost $80,000, and the county jail. There are three public parks, of which the principal one lies S. of the St. Mary's river. N. of the river is a trotting park. Of the five cemeteries, the largest and handsomest is Linden Wood, 1½ m. W. of the city, containing 160 acres. The first impetus to the growth of Fort Wayne was given by the completion of the Wabash and Erie canal about 1840. Numerous plank roads were afterward built, and since 1850 a still more rapid advance has resulted from the construction of railroads, of which five intersect at this point, viz.: the Toledo, Wabash, and Western; Pittsburgh, Fort Wayne, and Chicago; Fort Wayne, Jackson, and Saginaw; Fort Wayne, Muncie, and Cincinnati; and Grand Rapids and Indiana. The buildings of the two towns first named are extensive. All the machine work, building of cars, and repairing for the western division of the Pittsburgh, Fort Wayne, and Chi-
cago road are done here. The buildings for this work are of brick, mostly two stories high, and cover six acres. Good water power is furnished by the canal and the river, and the manufactures are important. The Fort Wayne machine works, with machine shop, foundery, car wheel shop, boiler shop, and blacksmith shop, employ 125 men. There are also 2 other machine shops, 8 flour mills, 8 planing mills and saw and door factories, 4 tanneries, 3 cabinet works, 2 manufactories of agricultural implements (reapers and mowers, threshing machines, &c.), a woolen factory employing 70 men, a hub, spoke, and bending factory, having 125 men, 3 national banks with a capital of $750,000, and 3 insurance companies with $555,000 capital. The city is divided into nine wards. There are efficient police and fire departments, and the streets are well paved and lighted with gas. The principal charitable institutions are the orphans' home and the city hospital. The public schools consist of a normal school, a high school and 8 grammar schools, which in 1873 had 55 teachers and an average attendance of 2,880 pupils; expenditure for school purposes, $41,300, of which $35,000 were for teachers' wages. Concordia college (Lutheran), established in 1850, had 4 professors, 148 students, and a library of 1,000 volumes. Fort Wayne college (Methodist), established in 1846, had 7 professors, 122 students, and a library of 1,800 volumes. There are 4 German Reformed, 3 Roman Catholic, and 6 Catholic parochial schools. Two daily newspapers, one tri-weekly (German), and six weekly (two German) are published. There are 15 churches.—The site of Fort Wayne was visited as early as 1700 by the French for the purpose of trading with the Indians. Prior to 1719 they established a regular trading post here, and subsequently erected Fort Meigs. In December, 1780, the British built a fort on the E. bank of the St. Joseph's near its mouth. In October, 1794, Gen. Wayne erected the government post of Fort Wayne; in 1825 the town was laid out; and in 1840 the city was incorporated.

FORUM, in ancient Roman cities, an open place used for the administration of justice or the sale of goods, and for the transaction of all kinds of public business. In this respect it corresponded with the agora of the Greeks; but unlike this, it was oblong in form, and never square. In a Roman camp it was the open space before the tent of the general, and the word also forms a part of the name of many towns and villages. The Romans had two kinds of fora, the cieilia, sometimes called judicialia, in which popular assemblies and courts of justice were held, and where the bankers and weavers usually had their stands; and the senatia, which were used exclusively for mercantile purposes. The city of Rome contained 19 of both kinds; but the forum Romanum, whose origin is coeval with that of the city, and which is known by the general name of the Forum, was by far the most important, notwithstanding some very magnificent ones were built under the emperors. It occupied a hollow space between the Capitoline and Palatine hills, extending in its longest diameter probably from the arch of Septimius Severus to the temple of Antoninus and Faustina. Around its four sides stood temples, basilicas, triumphal arches, and other public edifices, while within it were the rostra or stages from which orators addressed public assemblies, statues of illustrious Romans, columns, and trophies of war. At the comitium or upper end were suspended the laws of the twelve tables, and the fasti or calendar of all the days on which legal business could be transacted before the praetor. It is now known as the Campo Vaccino, from having been used for several centuries as a cattle market, and preserves no traces of its ancient splendor beyond a few scattered columns. A forum judiciale was built by Julius Caesar, and another by Augustus, which, with the forum Romanum, seem to have been the only ones in Rome for the transaction of public business.

FORWARDING MERCHANT, one whose business it is to send forward goods to a distant consignee. There are in the United States persons who engage in this business almost exclusively, especially in the western cities, in which produce accumulates on its way to the east, and to which eastern goods are carried for distribution through the west. There is nothing, however, in the business which is so far peculiar to them as to be governed by peculiar laws of its own, and therefore call for especial statement. But there are two classes of persons who come under this name, or discharge the duties which it describes, and of whom more should be said. One of these consists of those who are called expressmen, and the other of common carriers. The expressman carries goods on his own route, undertake to forward them still further. The whole business of expressmen is of comparatively recent origin; but it has already reached an immense extent and importance. It has grown out of common carriage of goods, but differs from it mainly in the fact that expressmen have no means of carriage of their own, but hire cars or vehicles, or room in them, and usually go with their parcels. It may be said, too, that they usually carry parcels only, or if larger packages, still not cargoes or large quantities of goods, as hundreds of barrels or bales, the carriage of these things being still left to common or private carriers. The principal question in relation to expressmen has been, are they still common carriers in law, and do they as such come under the strict responsibilities of common carriers? In other words, do they insure the safe carriage and delivery of all the goods against all risks “except the act of God and the public enemy”? It is now settled that they do thus insure the goods they receive throughout the whole route for which they profess to be carriers, and that they are therefore liable for any loss or injury
to them, without any proof or intimation of their negligence or default. No customer is bound to inquire by what means or by what arrangements the expressman proposes to carry his parcel. If he receives it in Portland, and undertakes, specially or by general advertisement, notice, or sign, to “express it through” (to use a common phrase) to New Orleans or San Francisco, he is responsible for its safe delivery there.

—A railroad company which takes goods at one place to be carried to a distant one might be thought to come necessarily under the same rule, but it is not quite so. There is this difference between the two cases: the expressman has not, or is not known to have, any regular means of conveyance of his own for any definite portion of the distance over which he assumes to carry the goods. The owner who gives him a parcel in Portland for New Orleans has no means of knowing, and indeed no reason for supposing, that the expressman has not made similar arrangements for all the parts of his route that he has made for any part. It is indeed commonly understood that every expressman does not undertake to convey goods everywhere, but this man advertises from A to B, because he has so arranged and provided, and that man from A to C, and the other from A to D; and his advertising, or indeed his undertaking to carry to the specified place, may properly be understood as a declaration on his part that he has made sufficient preparation in that direction and to that distance. But if the man in Portland puts goods on board a railroad car to go to New York, he knows, or should know, that the railroad company will convey it a certain part of the way in their own carriage, and under the charge of their own servants, and will not and cannot do anything beyond that point except to put it safely on board of the cars of another company, who will take it to or toward New York. That is, the man in Portland knows that the railroad company will there receive the parcel as a carrier, and take it a certain distance as carrier, and will then act as a forwarding merchant for the rest of the route, sending it on in the best way they can. Here then is a change of relation, and with it a change of obligation; for the essential difference is this: a common carrier insures his goods against all risks but those arising from the act of God or the public enemy; but the forwarding merchant is liable only for his own default or neglect. If a company take a parcel in Portland, and it is lost between Boston and Worcester, no one knows how, the sender can look at once to the company that took it if they are carriers all the way, but not if they were carriers only to Boston, where their road ends, and only forwarding merchants for the rest of the route, and can show that they delivered the parcel safely and properly for further carriage. If the parcel be lost, they are not liable. The sender may only call on the company who had it in their possession or under their care when it was lost. But if, as sometimes happens, it can be traced beyond the first carrier, and no negligence can be imputed to him, and no one knows what has become of it, the sender is wholly remediless unless the first carrier is carrier to the end. Whether he is so or not has been very much disputed. Cases arising on this point have been very frequent both in England and the United States, and perhaps the law may not be positively determined in either country. Perhaps it may be said that the English courts are more disposed to fix the liability of carrier to the end upon the party that first takes charge of the parcel than our own courts; but upon the whole, and resting upon the most recent adjudications, the rules of law in this matter may be summed up thus. There may be a partnership in the business of common carriage as in all others, and a railroad company may connect itself with other companies or with other carriers, and form a quasi partnership, the effect of which will be that each member will be liable, in solido, for all the rest. In that case, all the companies on the whole route are liable for a loss occurring in any part; and in particular the first company taking the parcel, or the last into whose hands it may be traced, may be made liable severally for any loss which has happened on the route. The company comes under such a liability equally by forming such a partnership and entering into such a joint business, or by advertising or indicating such a joinder in business, in any way which entitles third parties to act on the belief of it. And if such companies have a joint agent at either terminus or at any station, and this agent, with the knowledge of all, and purporting to act for all, sells a through ticket, as it is called, none of the companies thus represented can deny their joint business and joint or several liability for the whole; and if the price of the ticket is credited by the seller to all the companies and is divided among them, this constitutes conclusive evidence that each of them undertakes to be a carrier, with a responsibility as such, through the route. But the mere fact that a parcel directed to a distant place is received at a station, and there paid for for the whole route, does not of itself make any carrier for a part of the distance liable as carrier beyond that part. The test of the liability in every case is, what did the party undertake to be and to do? If he said he would carry all the way, he is liable as carrier all the way. If he said he would carry a part of the way and then send it on, he is only liable accordingly. And taking all the facts into consideration, which of these bargains was it that the railroad company made with the sender?—With this principle to guide us, we may return to expressmen. A person living at Albany wishes to send by express a parcel! New Brunswick is given it to an expressman of Albany, who takes it to New York, and there gives it to the express-
FOSCARI

man for Boston, who pays the Albany man his fee for bringing it to New York, and takes it to Boston. The expressman between Bos-
ton and New Bedford pays the New York man what he paid, and also the fare from New York to Boston, and takes it to New Bedford; and the consignee when he takes the parcel pays the man who gives it to him all he has paid, and in addition his fare from Boston to New Bedford. Now, if the parcel did not arrive safely, but was lost somewhere on the route, is each one of these expressmen liable for the whole? We should say this must de-
pend upon what each one undertakes to do. If the Albany man advertises that he takes goods to New Bedford, he is liable as far as New Bedford as carrier. If he advertises that he carries parcels to Boston, he is so liable to that place; if only to New York, he is lia-
ble as carrier only to New York, and as for-
warding merchant at New York, and there his liabil-
ity ends; and so of all the rest. Express-
man now not commonly insert in their bills of lading or receipts which they give their cus-
tomers a clause to this effect: "This company is responsible only as forwarders, and only for the negligence or other default of persons em-
ployed by them; and this is a part of our con-
tract with all whose goods we carry." But the law is now settled that while a common carrier may make a valid special bargain with his cus-
tomer, a mere notice or declaration upon a ticket or bill of lading does not constitute such a bar-
gain, unless assented to by the customer.

FOSCARI, Francesco, doge of Venice, born about 1373, died Oct. 81, 1457. Elected doge in 1428, the whole period in which he gov-
erned the republic was one of war and tu-
mult. The sultan Amurath II. laying siege to Salonica, Foscari despatched troops thither, who repelled the Mussulmans. He then en-
gaged in hostilities with the duke of Milan, Filippo Maria Visconti, and subjected to the republic the territories of Brescia, Bergamo, and Cremona, making the Adda the boundary of the Venetian dominion. The war was soon renewed with various success, nearly all the Italian cities taking part in it; but the doge, supported by Cosmo de' Medici and by Fran-
cesco Sforza, marquis of Ancona, still further extended his power by a treaty concluded in 1441. New wars, involving extensive leagues though little bloodshed, followed soon after; but in his old age Foscari had made peace with all the enemies of Venice, including Mohammed II., the successor of Amurath, when Jacopo, the last survivor of his four sons, was brought a second time before the council of ten, falsely charged with the assassination of its chief. The tribunal, jealous of the power and popularity of the doge, ordered him first to torture and then to exile in Candia. The young Foscari, whose mind was disordered by suffering, wishing after long banishment to see his coun-
try again at whatever peril, effected his return thither, but being condemned again, had scarce-
ly reached the place of exile when he died. This event is the subject of Byron's tragedy, "The Two Foscari." For the old doge one other humiliation remained. He had twice asked leave to resign his office, but the council had obliged him to retain it. He was now de-
posed, through the machinations of his en-
mies, and died a few days after in a spasm as he heard the bells of St. Mark announce to Venice the election of a new ruler.

FOSSOLO, Niccolò Ege, an Italian poet and miscel-
laneeous writer, born in the island of Zante, of a Venetian family, Jan. 26, 1777, died at Turin, Green, near London, Sept. 14, 1827. He was educated in Venice, and at the universi-
ty of Padua. His first tragedy, Tisste, was produced at Venice in 1797, and was so unsatis-
factory to the author that he himself published the severest criticism of it. When Venice was surrendered by Bonaparte to Austria he retired with other patriots to Milan, and wrote a politi-
cal romance called Lettere di due amanti, after-
ward republished under the title of Le ultime 
lettere di Jacopo Ortis. In 1799 he volun-
teer ed in the Italian contingent of the French army, took part in the defence of Genoa under Masséna, and returned to Milan. When in 1802 Napoleon assembled the consulta of Italian 
depu ties at Lyons to provide a new con-
stitution for the Cisalpine republic, Foscolo was appointed to report upon the state of the country; and in an elaborate discourse he con-
trasted the abuses of the military government which had been established with the free govern-
ment which had been promised. In 1808 he was appointed professor of Italian eloquence in the university of Pavia; but the political in-
dependence evinced in his lectures soon caused his chair to be suppressed. At this period he 
published his beautiful lyric poem I sepolcri, his tragedy of Aja, and an Italian translation of Sterne's "Sentimental Journey." On the fall of Napoleon he retired to Switzerland, and in 1816 to England. He wrote for the reviews articles on Dante, Petrarch, Boccaccio, and other Italian authors, delivered lectures on Italian literature, published an "Essay on Pet-
trach" in a separate volume (1823), and edit-
ed the Dieina Commendia of Dante (1823). His 
Epistolario (8 vols.) and a new edition of his 
Fosse were published at Florence in 1856. His remains have been removed from Chis-
wick, England, to the church of Santa Croce, Florence.

FOSSANO, a town of Piedmont, Italy, on the left bank of the Stura, in the province and 13 m. N. N. E. of the city of Coni, and 84 m. S. by E. of Turin; pop. about 7,000. It is an antique, dismal, but regularly planned town, built on a high hill, surrounded by walls, and defended by a strong fortress which commands the val-
ley of the Stura and the road into France by the Col d'Argentièrè. The houses are built upon arches over the footsteps, and the pas-
sages in many places are so low that a tall person can hardly walk upright in them. It
is the seat of a bishop, and has an academy of science and art, a veterinary school, a phil-harmonic academy, and a theatre. It was a walled place in the 13th century, was frequently attacked by the counties of Asti and Saluzzo, and early in the 14th century put under the protection of Philip of Savoy. It figured in the wars between Charles V. and Francis I. It was taken by the French in 1796, and in 1799 the French under Championnet were defeated here by the Austrians under Melas.

FOSSIL. (Lat. fossilia, dug up), a term formerly applied to all mineral substances, but now used to designate only the remains of organic bodies found in geological formations. The general subject will be treated under the title Paleontology, and the more important fossil animals under their respective names.

FOSSIL FOOTPRINTS, or Ichnolites (Gr. ἰχνος, a track, and ἱδρος, a stone), in geology, impressions originally made by animals in clay or in sand, and preserved in the shale or sandstone rock resulting from the solidification of those materials. Under these names have been included markings of various forms in rocks of very different geological ages. Some of these markings, though doubtless made by animals, are not the impressions of their feet, but have been produced wholly or in part by their tails or their carapaces; and to these, although truly ichnolites or track-stones, the name of fossil footprints does not therefore apply. It will, however, be convenient to include under this head all the markings of animals found in rocks. Recent impressions of the feet of quadrupeds, birds, and reptiles, and the markings made by crustaceans, mollusks, and worms, may be studied on the shores of tidal waters, where successive layers of mud and sand preserve them in the accumulating sediments; and the careful study of these by Dawson has thrown much light on some of the markings found in earlier rocks. To begin with the ichnolites found in rocks of cenozoic or tertiary age, we may notice those in the oecene of the basin of Paris, where, in the marls which are interstratified with the gypsum beds which there abound, are found a great variety of markings. Prominent among these are the trilobed footprints of several species of palaeotherium, a large pachyderm allied to the modern tapir, beside those of anoplotherium, an animal more nearly allied to the ruminants, and of certain carnivorous mammals. In addition to these are tracks of various land and fresh-water tortoises, of a gigantic bird, and of crocodiles, iguanas, and great batrachians or frog-like animals. The bones of many of the mammals whose tracks are here met with occur in the gypsum beds which are interstratified with the marle; but others were evidently marked by species of which the bones have not been discovered, and which are consequently known to us only by their foot marks. The whole condition of things here shows that there then existed numerous small lakes of fresh water, the shores of which were frequented by great numbers of pachyderms of numerous species, and by beasts of prey which occasionally devoured them, the tooth marks of the carnivora being found on the bones of the former. It will thus be seen that it is only in rare localities that the conditions necessary for the formation and preservation of these foot marks occur, and it is a fortunate chance which exposes them for our inspection. It was not till 1859 that these were discovered in the neighborhood of Paris.—In the mesozoic period the footprints of the trias or new red sandstone are remarkable for their number and variety, and also for the interest which attaches to the history of their discovery in the valley of the Connecticut river, where they are very abundant. Attention was first called to these so-called bird tracks by Mr. Dexter Marsh, and they were subsequently studied by Dr. James Deane and by Prof. Edward Hitchcock, who, after a careful examination of them concluded that they were truly the footprints of birds; and they were therefore called by him ornithichnites or bird tracks. He ascertained their existence in numerous localities, and showed that they occur at intervals through a thickness of 1,000 ft. of sandstones and shales. He further remarked that although the beds bearing the tracks are now inclined at angles of from 5° to 20°, they must have been horizontal at the time the impressions were made; and showed that their occurrence throughout so great a thickness of strata could only be accounted for by supposing that the surface was subsiding during the deposition of these rocks. Some of these tracks were of gigantic size, one of them measuring 10 by 16 in., and recurring at intervals of from 4 to 6 ft. along the surface of the rocky bed; these distances indicating the length of the strides made by the animal. A careful study of these markings during many years convinced Prof. Hitchcock that many of them were made not by birds, but by batrachians or huge frog-like animals; and in an elaborate report by him, published by the state of Massachusetts in 1866, he showed that the ichnolites of the red sandstone had been found in not fewer than 38 localities, extending over a length of 90 m., with a breadth of 2 or 3 m., in the Connecticut valley. The markings known to him were referred to as many as 119 species of animals, including quadrupeds, birds, lizards, batrachians, tortoises, fishes, crustaceans, insects, and worms. While most of these markings were made on land, others were apparently produced by animals like fishes, swimming near the bottom. The surfaces of many of the beds bear the marks of waves or ripples, and others are distinctly marked by ruts. The characteristics of these ichnolites made by Prof. Hitchcock, and now in the museum of Amherst college, is very great, and shows more than 8,000 individual tracks. A few remains of bones and coprolites have been found in the sandstones
of this formation, but they have not thrown much light upon the animals producing the tracks. Footprints have since been met with in the sandstones of the same formation in New Jersey, and in their probable equivalents, the lower triassic sandstones of Lancashire and Cheshire in England, and also at Hildburghausen in Saxony. These European footprints have a rude resemblance to the human hand, and were for some time regarded as the marks of an unknown quadruped, to which was given the name of chei- rotherium, a supposed marsupial allied to the kangaroo. The tracks are of considerable dimensions, and those of the hind and fore feet differ greatly in size. They have since, however, been referred with greater probability to the labyrinthodon, an animal allied to the crocodiles, to which may be due some of the footprints of the Connecticut valley. But beside these five-toed and four-footed animals, were those which made the three-toed biped impressions at first regarded as the tracks of birds, and very abundant in the Connecticut sandstones. Prof. Hitchcock finally recognized the fact that some of these animals had huge tails, which had left their impressions, and smaller fore feet or paws, which they sometimes put to the ground; and he then referred them to a kind of bird-like lizards. More recent studies of the fossil remains of these animals, which have been carefully made by various naturalists, and especially by Copé, have made us acquainted with that curious class of animals, the dinosaurs. These creatures constituted numerous genera and species, some of gigantic size, others comparatively small; some feeding on plants, and others carnivorous; but all remarkable for presenting a higher type of reptilian organization than any now existing, and approaching in some respects to the birds and in others to the mammals. Among the vegetable feeders of this group was hadrosaurus, a gigantic animal, 20 ft. or more in height, with huge bird-like legs and feet, a lizard-like tail, a diminutive head, and small fore feet or hands, feeding on plants; while lepto was an equally huge carnivorous animal of somewhat similar organization. The animals which made the so-called bird tracks in the sandstone of the Connecticut valley were probably similar to these.—If we go backward to the paleozoic period, we find in its upper portion, in the rocks of the coal formation in Pennsylvania, footprints which probably belong to an air-breathing frog-like animal related to the labyrinthodon of the mesozoic. Footprints, apparently of bestrichian reptiles, are also found in the carboniferous formation of Nova Scotia. These, so far as we know, are the oldest air-breathers, and the remains of animals of this kind which abound in the rocks of this region have been described and figured by Dawson. In the great series of paleozoic rocks beneath the coal, comprising the Devonian, Silurian, and Cambrian, we have numerous ichnolithes, but, so far as we know, belonging, unlike those which we have described, solely to fishes or to invertebrate animals. The sandstones at the base of the coal in Nova Scotia are marked with the tracks of a crustacean allied to the limulus or king crab; and to an animal of that kind are ascribed those curious markings found in the beds of the Potomac sandstone at several localities in the St. Lawrence valley near Montreal, to which the name of pro-litchinites has been given. These tracks, at first supposed to be the footprints of a large tortoise-like animal, show the presence of several pairs of walking feet and of a flexible tail. In the same sandstone beds are singular ladder-like markings, which have been called climactichinites. Dr. Dawson has in this connection studied carefully the habits of the king crab, and has shown that when walking on the sands it produces impressions very like pro-litchinites, and when using its swimming feet, markings like climactichinites were the result. In the Chazy and Clinton divisions of the lower paleozoic in New York and in Canada are curious biolobate markings, which were supposed to be the impressions of a marine plant, and received the name of rupophyces, but according to Dawson are really casts of burrows, connected with footprints consisting of a double series of transverse markings, so that a comparison of them with the trails and burrows of limulus justifies the conclusion that they were produced by trilobites. To these markings he has given the name of rusichinites, and has recognized the existence of similar forms in the carboniferous, which he refers to the trilobites of the genus Phillipsia found in these beds. The curious markings which have been called crustiana, from the lower Cambrian rocks, were probably produced by crustaceans not dissimilar to those which made rusichinites. Curious parallel notched grooves in pairs, found in the carboniferous of Nova Scotia, have been described and figured by Dawson under the name of diplichinites, and referred by him, with great probability, to fishes having pectoral or ventral fins armed with spines; while in rocks of the same age and still older, down to the base of the Cambrian, are numerous grooved and striated markings, some of which may have been produced by the feet or spiny tails of swimming animals. Other markings are with probability ascribed to lingula, which, as Prof. Morse has shown, crawls in a worm-like manner over the surface; while others still are perhaps produced by the trailing of seaweeds drifting with tides or currents. Certain markings of this kind have been regarded as impressions of the stems of plants, and, occurring in the oldest Cambrian rocks, have received the name of eophyton. According to Dawson, however, they are more probably the grooves produced by swimming crustaceans; and he includes under the name of rudichinites all those rod-like markings. Various imitative markings are met with in rocks,
which are probably not due to any organic bodies. Such are the rill marks produced by running water on the surface of soft argillaceous layers, which sometimes simulate frowns of ferns or seaweeds, or the tracks of worms.—The literature of this subject is considerable, and, as will be seen from the facts already given, the study of ichnolites is one of much geological interest. Besides the publications of Hitchcock, see Lyell's "Student's Manual of Geology," and a paper on the subject by Dawson in the "American Journal of Science" for January, 1878.

FOSSOMBONE (anc. Forum Sempronii), a town of central Italy, in the province of Pesaro ed Urbino, 9 m. E. S. E. of Urbino; pop. about 10,000. It is situated on the road from Fano to Rome, in a narrow valley on the Metauro. It is the seat of a bishop, and has a cathedral with many ancient inscriptions, and an old castle. The most important branch of industry is silk culture. Near here Hasdrubal was defeated by the Romans in 207 B. C. The town was destroyed by the Goths and again by the Lombards, but rebuilt by the Malatestas, who in the 14th century sold it to the duke of Urbino.

FOSTER, A N. E. county of Dakota, intersected by the Sheyenne, a branch of Red river; area about 1,700 sq. m. It has been recently formed, and is not included in the census of 1870. The Dakota or James river crosses the S. W. corner, and there are several small lakes.

FOSTER, Birkt, an English artist, born at North Shields in 1812. At the age of 16 he was placed with Mr. Landells, a wood engraver, by whom he was advised to turn his attention to drawing rather than engraving. His carvings on wood, especially of landscapes and forest scenes, are among the best modern productions in that department of art. For some years he has successfully devoted himself to painting in water colors, but without wholly abandoning drawing upon wood for engravers.

FOSTER, James, an English dissenting minister, born in Exeter, Sept. 16, 1697, died Nov. 5, 1753. He was educated in his native city, began to preach in 1718, and after removing from Devonshire to Melbourne, and thence to Ashwick, became pastor in the Barbican, London, in 1724, was afterward lecturer at the Old Jewry, and in 1744 minister at Pinner's hall. His reputation for eloquence was such that persons of every rank flocked to hear him. Besides many sermons, he published an "Essay on Fundamentals, especially the Trinity" (1720); "Defence of the Usefulness, Truth, and Excellence of the Christian Religion" (1731); and "Discourses on the Principal Branches of Natural Religion and Social Virtue" (London, 1746-59).

FOSTER, John, an English essayist, born in Halifax, Yorkshire, Sept. 17, 1770, died at Stapleton, near Bristol, Oct. 15, 1843. In early life he was a weaver, but at the age of 17, having united with the Baptist church, he resolved to devote himself to the ministry, and finished his studies at the Baptist college in Bristol.

He commenced his career as a preacher at Newcastle-on-Tyne in 1792, and afterward went to Dublin, and endeavored unsuccessfully to establish himself either as a preacher or schoolmaster. In 1797 he went to a Baptist chapel in Chichester, and thence successively to Downend in 1800, and to Frome in 1804; but though his preaching was powerful, it made little or no impression on the popular mind. While at Frome he first published his celebrated "Essays," and also became the principal contributor to the "Eclectic Review," the articles for which (185 in number) formed his almost exclusive literary labor for 18 years. In 1817 he returned to Downend, where he wrote his "Essay on the Evils of Popular Ignorance," in which he gives an appalling description of the barbarism prevailing in the lower classes of the English population. His health failing, he then employed himself chiefly in preparing works for the press, though preaching at intervals until his death. He was a profound thinker and a powerful writer. His remaining books are: "Contributions, Biographical, Literary, and Philosophical, to the Eclectic Review" (3 vols. 8vo, 1840); "Lectures delivered at Broadmead chapel, Bristol" (1st series, 1844; 2d series, 1847); and "Introductory Essay to Doddridge's Rise and Progress" (1847). The "Life and Correspondence of Foster" (2 vols. 8vo), edited by J. E. Eyland, was published in 1846.

FOSTER, John Wells, an American geologist and archeologist, born at Brimfield, Mass., in 1815, died in Chicago, June 29, 1878. He graduated at Wesleyan University, Middletown, Conn., in 1885, and one year later removed to Zanesville, Ohio, where he was admitted to the bar. He assisted in the geological survey of the state of Ohio, begun in 1857, and made a report on the central district, with a detailed section of the carboniferous limestone near Columbus, to the uppermost bed of coal near Wheeling. This was the first section ever made through the Ohio coal field. In 1845 he visited the Lake Superior copper region in the interest of several mining companies, and two years later was an assistant in the government survey of that territory. He was associated in this work with Prof. J. D. Whitney, and after 1849 the completion of the survey was left to them. "Foster and Whitney's Report on the Lake Superior Region," published by congress, is still the highest authority on this subject. He subsequently resided in Massachusetts a few years, and in 1855 was a candidate for congress in the 10th district. In 1858 he removed to Chicago. During his geological expeditions he collected a vast amount of matter not strictly pertinent to the topics in hand, but finally compiled and published under the title of "The Mississippi Valley" (8vo, Chicago and London, 1869). He also spent much time in studying the mounds and other evidences of ancient races in the Mississippi valley, and the result
of his discoveries and speculations was given in his "Pre-Historic Races of the United States" (Chicago, 1873). He was a frequent contributor of scientific papers to periodical literature, and published several monographs on American ethnology and antiquities.

FOSTER, Randolph S., D.D., an American clergyman, born at Williamsburg, Ohio, Feb. 30, 1820. He was educated at Augusta college, Kentucky, and in 1837 entered the itinerant ministry of the Methodist Episcopal church in connection with the Ohio conference. From 1837 to 1850 he was pastor of churches in Hillsboro, Portsmouth, Lancaster, Springfield, and Cincinnati, and from 1850 to 1857 in New York and Brooklyn. In 1857 he was elected president of the Northwestern university, Evanston, Ill. Three years later he resumed the pastorate, and was stationed in New York and Sing Sing. The general conference of 1863 appointed him delegate to the British Wesleyan conference of England, and during the same year he was elected professor of systematic theology in Drew theological seminary, Madison, N.J. In 1870 he was appointed president of this institution, retaining the chair of theology. In 1872 he was elected bishop of the M.E. church, and soon after was chosen to make an episcopal visitation in Norway, Sweden, Denmark, Germany, Switzerland, Italy, and South America. He has published the following works: "Objects to Calvinism" (12mo, Cincinnati, 1849); "Christian Purity" (revised ed., 12mo, New York, 1869); "Ministry for the Times" (18mo, New York, 1855); and "Theism," in the "Ingham Lectures" (12mo, 1872).

FOSTER, Stephen Collins, an American ballad composer, born in Pittsburgh, Pa., July 4, 1826, died in New York, Jan. 18, 1864. Early in life he evinced a taste for music, learned unaided to play on several instruments, and, having a good voice, delighted to sing songs of his own composition. In 1842, while he was a merchant's clerk in Cincinnati, his song "Open thy Lattice, Love" was published in Baltimore, and was very favorably received. It was followed by "Old Uncle Ned," and "O Susanna," written for the negro minstrels, which achieved such popularity that he determined to devote himself thenceforth to music alone. He wrote in rapid succession a number of negro melodies, among which were "Louisiana Belle," "Camptown Races," "My old Kentucky Home," "Massa's in the cold, cold Ground," "Nelly Bly," "O Boys, Carry me Long," "Old Folks at Home," and many others. These became familiar not only throughout the United States but in many distant lands, and won for him a reputation as a composer of simple melodies unsurpassed in his day. Between 300,000 and 400,000 copies of "The Old Folks at Home" were sold, and others attained an almost equal popularity. During the last years of his life he dropped the negro dialect and wrote many songs of sentiment, such as "Come where my Love lies Dreaming," "Willie, we have Missed You," "Jennie with the Light Brown Hair," "Farewell, my Little Dear," "O Community, Fill and Glass for Me," "Come with thy Sweet Voice again," and "Old Dog Tray." Besides a critical knowledge of music, Foster possessed a general and extensive intellectual culture. He composed both the music and the words of most of his songs, of which he published over 100. His ballads have been translated into many foreign languages and published with his music, which is marked by a sweetness and an indefinable grace and tenderness which everywhere reaches the popular heart.

FOTHERINGAY, a parish and village of Northamptonshire, England, on the river Nene, 27 m. N. E. of Northampton. Its famous castle, the birthplace of Richard III., and the scene of the imprisonment, trial, and execution of Mary, queen of Scots, was founded in the reign of the Conference and pulled down by James I., soon after his accession to the English throne. The village contains a handsome church, in which were buried Edward and Richard, dukes of York, the former slain at Agincourt and the latter at Wakefield.

FOUCAULT, Léon, a French natural philosopher, born in Paris, Sept. 18, 1819, died Feb. 11, 1868. While studying medicine he was impressed by the discoveries of Daguerre, and turned his attention exclusively to optics. He rapidly acquired proficiency in this branch of natural philosophy, and in 1844 invented an electric lamp, which has been adopted by natural philosophers for physical experiments, and used as a means of lighting large factories or yards. With Hippolyte Fizean he made a series of delicate experiments upon the phenomena of light. He solved a problem which had attracted the attention of Wheatstone, Arago, and many others, demonstrating that the velocity of light differs materially while passing through a vacuum or through transparent bodies. He was no less successful in mechanics than he had been in optics. By means of the pendulum he gave a new and striking demonstration of the rotary motion of the earth. The gyroscope, another instrument with which he experimented, not only affords new indication of the earth's rotation, and serves to measure it, but furnishes a means of determining astronomical positions without observation of the heavens. (See Gyroscope.) Foucault was rewarded for his labors by an appointment to an important post in the observatory at Paris, and received in 1865 the Copley medal of the royal society.

FOUCHÉ, Joseph, a French revolutionist and minister of police, born at La Martinière, near Nantes, May 29, 1768, died in Trieste, Dec. 25, 1820. He was sent to Paris to study theology, but without taking orders became professor of philosophy in Arras and other towns, and in 1788 was placed at the head of the college of Nantes. He afterward became an advocate, founded a republican association in Nantes,
was chosen in 1792 member of the national convention, voted for the immediate execution of Louis XVI, and in 1793 proceeded to Lyons with Collot d'Herbois, charged with the execution of the decree issued by the convention against that city, and shared in the violent measures and wholesale executions carried out there. After his return to Paris he was elected president of the Jacobin club (June 4, 1794). His influence and opposition gave umbrage to Robespierre, who caused him to be expelled from the club; but he rejoined it after the execution of Robespierre (July 28, 1794), upon whom he now endeavored to throw all the odium of his violent proceedings at Lyons. But he was denounced as a terrorist, driven from the convention (Aug. 9, 1795), and placed under arrest, but restored to liberty by the amnesty of Oct. 26, 1795. He afterward ingratiated himself with Barras, the president of the directory, by betraying to him the movements of Babeuf. The latter was guillotined in 1797, and Fouquet was rewarded with a large interest in the contracts for the army, and in September, 1798, was made minister to the Cisalpine republic. In the beginning of 1799 he was sent in the same capacity to Holland, but was soon called to Paris to enter upon the duties of minister of police. He adopted rigorous measures against political agitators, without distinction of party, cooperated in the coup d'état of the 18th Brumaire, and strengthened Bonaparte's position by his vigilance in detecting royalist and Jacobin conspiracies; but the first consul, who distrusted his minister, discarded him as soon as the apparent return of tranquillity rendered it practicable to dispense with his services, the office being abolished (September, 1802). He was made a senator, a post which yielded him about $18,000 annually, and Napoleon rewarded him also with half of the reserve fund in the treasury of the police, which amounted to nearly $250,000. In 1804, when Napoleon's position became more complicated, Fouquet was again employed. He opposed the execution of the duke d'Enghien, and said to Napoleon, "It is more than a crime, it is a political fault;" a saying which, in the form "It is worse than a crime, it is a blunder," has become proverbial, and has been generally attributed to Talleyrand. After the establishment of the empire, Fouquet was formally reinstalled as minister of police (July 10, 1804), and under his administration the tranquillity and order were secured at home, while Napoleon was engaged in fighting his battles abroad. In 1809 he received the title of duke of Otranto, with a large pension from the revenues of the kingdom of Naples. In the same year, while the minister of the interior Crétet was sick, Fouquet managed his department along with his own; and when the English landed on the island of Walcheren, he caused the whole national guard of France to be put in motion. In the following year he opened unauthorized negotiations with the court of St. James, and was dismissed (June 6). Savary was appointed minister of police, and the governorship of Rome was assigned to Fouquet as a sort of honorable exile. He did not go to Rome, but was compelled to leave France on his refusing to surrender certain autograph letters of Napoleon and other important documents, and was only permitted to come back on condition of giving them up. Napoleon began to fear the intrigues of Fouquet, and kept him out of France by calling him to Dresden, and sending him afterward to Illyria as governor, and subsequently to Rome. In January, 1814, he wrote to the emperor from Rome, recommending the adoption of a more conciliatory policy. Returning to France in the spring, he announced at Lyons and at Avignon the approaching fall of Napoleon, and entered Paris two days before the coup d'Artois. On April 28 he wrote again to Napoleon, urging him to leave Elba for the United States. At the same time he put himself in communication with the Bourbons. They suspected him, however, and on Napoleon's return from Elba issued an order for his arrest; but he contrived to make his escape, and became for the third time Napoleon's minister of police, while he was at the same time Talleyrand's correspondent, the tool of the court of émigrés at Ghent, and the bosom friend of the liberal deputies in the chamber. After the battle of Waterloo he sent for Dupont de l'Eure, Lafayette, and others, and made use of their republican feelings to precipitate the overthrow of the emperor; and after his master's final abdication he became the leader of the provisional government (June 23, 1815). He was appointed for the fourth time minister of police by Louis XVIII. (July 6), but, placed between the opposition of the extreme republicans and the extreme royalists, his position became intolerable. He presented to the king two reports on the disturbed state of France, which created a great sensation, and which are the best of his political writings. He resigned the ministry Sept. 19, and was appointed ambassador at Dresden, but was deprived of that office by the law of Jan. 12, 1816, which affected all who had voted for the death of Louis XVI. From Dresden he removed to Prague, where he spent about two years; and having become in 1818 a naturalized subject of Austria, he resided for some time in Linz, and for the rest of his life in Trieste.—See Count Martel's Étude sur Fouquet et sur le communisme dans la pratique en 1794 (Paris, 1873).

FOUGÈRES, a town of France, in the departments of Ille-et-Vilaine, on a hill near the Nançon, 27 m. N. E. of Rennes; pop. in 1866, 9,580. It is the seat of a subprefecture, a court of primary jurisdiction, and a communal college, and has manufactories of sail cloth and hempen fabrics, flannels, hats, and leather. It was anciently fortified, and was considered
one of the keys of Brittany until that province was united with the crown of France.

FOULD, Achille, a French statesman and financier, of Jewish parentage, born at Paris, Nov. 17, 1800, died at Tarbes, Oct. 5, 1887. His father was a banker of great wealth, and he enjoyed an unusually careful and elaborate education, which was completed by extensive travel in Europe and the East. He entered prominently into political life in 1848, when he was chosen to represent Tarbes in the chamber of deputies. In that body he at once took a high rank as an economist and financier, and confined himself almost entirely to this department of political action. Under the presidency of Louis Napoleon he was made minister of finance, and although disagreements with the president caused him twice to retire from the office, he was each time re-appointed. On the establishment of the empire, Napoleon made him a senator, and shortly afterward appointed him minister of state and of the imperial household. To him were intrusted the management and preparation of the universal exhibition of 1855, and the direction of the works on the new portion of the Louvre (1855-7). On Nov. 12, 1861, he was again made minister of finance, and held office until January, 1867, when he resigned in consequence of the imperial decree of the 19th of that month, making important changes in the administration of the government. He was the author of several pamphlets on financial questions.

FOULIS, Robert, a Scottish printer, born in Glasgow, April 20, 1707, died in Edinburgh in 1778. He was a barber's apprentice, but falling under the notice of Dr. Hutcheson, professor of moral philosophy at Glasgow university, was encouraged to perfect his education and become a printer and bookseller. In company with his brother Andrew (born Nov. 28, 1712, died Sept. 18, 1778) he made journeys to England and the continent during the summers in connection with his new business, and employed his winters in teaching. In 1749 he opened a shop in Glasgow, and in the following year commenced publishing. In 1748 he was appointed printer to the university, and afterward took Andrew into partnership. Their editions were remarkable for correctness and elegance, those of the Greek and Latin classics ranking with the best of the famous Aldine series. The Foulis edition of Demetrius Phalaris's De Elecutione (1749) is thought to be the first Greek work published in Glasgow.

Among the most valuable productions of this press were: Horace (12mo, 1744), the sheets of which were hung up in the university with the offer of a reward for the discovery of any error in them; Homer (4 vols. fol., 1756-8); Thucydides, in Greek and Latin (8 vols. 12mo, 1769); Herodotus, in Greek and Latin (9 vols. 12mo, 1791); Xenophon, in Greek and Latin (8 vols. 12mo, 1769-74); Gray's poems, Pope's works, &c. The two brothers acquired in time an ample fortune, which they lost by an unsuccessful attempt to establish at Glasgow an academy of painting and sculpture.

FOUNDERY. See CARTING.

FOUNDLING HOSPITAL, a public institution for the reception and support of deserted children. Some of the nations of antiquity were notorious for their disregard of the promptings of humanity in the treatment of foundlings. Their wisest legislators and philosophers considered infanticide justifiable under certain circumstances, and Lycurgus, Solon, Plato, and Numa condemned to death all weak or deformed children. But infanticide was punished by the ancient Egyptians, the guilty parent being compelled to pass three days and nights with the corpse of the child fastened to his neck. The laws of the Persians and the Jews also protected helpless children. In Thbes both child murder and exposure of children were forbidden. At Athens children were commonly exposed in the gymnasium called Cynoasges, and in Rome at the columna lactaria, a pillar which stood in one of the public market places. The state assigned foundlings as property to those who would adopt them; and those not thus adopted were educated at the public expense. It appears that Athens and Rome had public foundling hospitals at an early period, and the appellation of βρεφόφρονες is believed to have had reference to that in the Cynosarges of the former city, while Rome is supposed to have possessed an establishment of the same kind at the columna lactaria. But most foundlings were left at the mercy of those who found them. The exposure of children became so common, that the classic historians speak with admiration of the nations who abstained from it. Strabo praises the Egyptians for their humane laws, and Ελλατικ οι θεήμες for their restrictive regulations on the subject; while Tacitus mentions as a circumstance deviating from the practices of the Romans, that the old Germans and the Jews considered infanticide a crime. Endeavors to restrain the cruel practice of exposing children are said to have been made in the early days of Rome; Romulus prohibited the murder of sons and of first-born daughters. But as the population increased and the public morals declined, those who had more children than they wanted exposed some of them. Ornaments and trinkets were deposited in many instances with the children, partly with a view of enticing the people to take care of them, and partly to facilitate a future identification. Imperial Rome early afforded assistance to abandoned children. Augustus offered 2,000 sesterces to citizens who would take charge of orphans. Livia and Faustina adopted a number of deserted girls. Trajan gave alimentary pensions, and had the foundlings cared for under the name of children of the state. The first Christian emperors did not venture to punish the exposure of children, but Constantine instead of persecuting the parents of foundlings upon fathers guilty of taking the life of their children,
and called exposure also a kind of murder. He deprived parents of all hope of being able to recover the children, and decreed that parents who were too poor to educate their children should receive pecuniary assistance. But the practice of exposure was nevertheless continued for a long time after, and was not completely prohibited till the time of Valentinian, Valens, and Gratian, in the latter part of the 4th century. The emperor Justinian passed a law in 529 which declared foundlings to be free, and forbade those by whom they were received and educated to treat them and detain them as slaves. The public institutions which are believed to have existed for the reception of foundlings in Rome in the 6th century are called by Justinian brephotrophia, in imitation of the Greek institutions, but nothing is known about their regulation and organization. Establishments for foundlings are said to have existed in the 7th century in Angeln, and about the same time at Treves, both in the Frankish dominions. The capitularies of Charlemagne refer to foundling hospitals as distinct institutions. In Milan an institution was founded about 787 by an archpriest named Dathius, to prevent infanticide. Of the prevalence of this crime he gives a very pathetic account in the letter of foundation, which has been published by Muratori. The mothers of children (mostly illegitimate) carried to this establishment strewed salt between the swaddling clothes, to denote that the infant had not been baptized. The foundlings were suckled by hired nurses, taught some handicraft, and at the age of seven discharged as free-born. This last regulation was probably made by Dathius, to guard against the custom by which the foundlings became the property of those who received and educated them, unless they were demanded back by their parents within ten days. In 1070 Olivier de la Traye founded at Montpellier a charitable order, whose members called themselves hospitalarii Sancti Spiritus, and devoted themselves to the assistance of the poor, and of foundlings and orphans. A separate foundling hospital for 600 children, under the name of hospital of the Holy Ghost, was founded in the city in 1180 by a member of that order, the count Guy of Montpellier, which was sanctioned by Pope Innocent III. in 1198. During the 18th century foundling hospitals were established at Rome, and at Kempten in Germany. The magnificent foundling hospital at Florence, called at present spedale degli innocenti, was founded about 1416; kindred institutions were established in Paris in 1589, and in Venice in 1580. The hospital at Nuremberg, founded in 1831, had a lying-in department, and made it obligatory on the children to refund the expense of their education. The hospital of the Holy Ghost at Marseille, founded after that in Montpellier, was the first to adopt the revolving box, by means of which the children could be conveyed into the building without any possibility of those who brought them being seen. At other places foundlings were put into marble shells at church doors.—The great hospital of Santo Spirito in Rome, on the right bank of the Tiber, near St. Peter's, contains a foundling hospital capable of accommodating more than 3,000 children. The number annually received is about 1,150. During the ten years ending in 1865, out of 11,426 received, 9,260 died. Many of the children are sent to the country to be nursed, and among them the mortality is said to be the greatest. There are several other foundling hospitals in Rome; the total number of foundlings is estimated at more than 3,000 annually, the facilities for admission being so great that children are brought from all parts of central and southern Italy. At Naples foundlings are chiefly cared for at the hospital della Annunziata. There are in Naples annually about 2,000 foundlings out of a population in 1872 of about 450,000. Naples has the reputation of devoting more care to the education and welfare of foundlings than any other city of Italy. The number of foundlings in Tuscany is about 12,000 out of a population in 1872 of 2,100,000. A considerable number of the foundlings in Italy are supposed to be legitimate children abandoned on account of poverty. About one in 16 of the children is claimed by the parents; the majority are cared for during infancy and childhood, either in the hospitals or among the neighboring peasantry, who supply them with board at a small remuneration. When of sufficient age they are dismissed to support themselves, but in many of the hospitals they have some claim in after life on occasions of distress or sickness. Many children carried to the foundling hospitals are accompanied by tokens. In the hospital degli innocenti at Florence a piece of lead imprinted with a number is hung round the neck of each babe, in such a manner that it cannot be easily removed. By these means, and by other tokens, it is easy to obtain information, even at a later period, in regard to each child. Illegitimate children cannot be returned until the expenses are fully refunded. —There are foundling hospitals in Cadiz, Barcelona, and other Spanish cities, and several in Madrid. The girls brought up in the foundling hospital at Barcelona were formerly led in procession when of marriageable age, and any man who took a fancy to one of them might indicate his choice by throwing a handkerchief on his favorite girl, and marry her. The number of foundlings annually received in the principal hospital at Madrid is about 1,500. The hospital is chiefly served by sisters of charity. The infants are intrusted to nurses, and at the age of seven are transferred to the college of the desamparados (forsaken), where they receive instruction. Some are sent to an asylum, where they are drafted to learn practical handicrafts, and this asylum is in a great measure self-supporting. In 1794 Charles IV. ordered that children of unknown parents should be considered legitimate and admissible
to public office; that all who called them bastards should be punished; and that foundlings in case of criminal sentence should receive such punishments only as could be imposed upon privileged persons, like the nobility and other high classes. In 1860 there were 146 foundling hospitals in Spain, with 53,464 foundlings; the illegitimate births in 1859 numbered 31,060.—In Portugal, where illegitimate births are much more numerous than in Spain, the number of foundlings is estimated at 77 annually to every 10,000 inhabitants. There are 21 foundling hospitals. The number of foundlings under care in 1860 was 88,500, about 16,000 being received annually, and the mortality was 50 per cent.—Among the first hospitals which educated foundlings in France was the Hôtel Dieu of Lyons (1523). Francis I. founded a kindred institution in 1526. A few years afterward it became customary for fathers of charity to place foundlings at the entrance of the cathedral of Notre Dame de Paris, exclaiming: Faisons bien à ces pauvres enfants trouvés ("Extend your charity to these poor foundlings"). They were accommodated in an asylum called la couche (the bed), at the expense of the dignitaries of the law and of the church. The metropolitan see, the monasteries, and chiefly the hospital of the Holy Ghost, were called upon to contribute toward their support. The dispensation of this charity led to grave abuses. The women hired to take care of the children traded with them. Some were sold to sorcerers, for use in their art; others to beggars, who paraded them in soliciting alms. The asylum was transferred to another house, but the donations were not sufficient to support the institution. The children increased in numbers at a fearful rate. Lots were cast to decide which should have the benefit of education, and those who drew blanks were entirely neglected. Many lost their health or died from the deteriorated milk of sickly nurses. Those admitted into the asylums were almost all illegitimate or of unknown parents. A foundling hospital was established in 1688 in the hospital of the Holy Ghost, under the direction of the city of Paris, and managed by an association of priests. The children were well educated, many of the boys for the priesthood, and many of the girls were married and provided with dowries. But this hospital (which was suppressed in 1767) refused to receive illegitimate children. St. Vincent de Paul pleaded the cause of the poor children who were excluded, collected funds, and in 1640 established a new institution for foundlings, with the assistance of philanthropic ladies, and with the cooperation of the king and the court. In 1760 it was converted into a public institution by Louis XIV., and was transferred to the rue de Notre Dame. Revenues were assigned to it and taxes raised for its support, and the first president and procurator general of the parliament placed at the head of its administration. The number of foundlings received at this institution in successive periods of 25 years, from 1640 to 1793, was: 7,668, 14,101, 88,883, 80,487, 66,465, 114,729, 129,148; total, 408,608. More than one third of these children came from the provinces. Serfdom had ceased to exist, and the seigneurs took this means to rid their lands of abandoned children, as they could no longer draw profit from them. In 1779 parliament ordered the nobles to provide for the children found on their lands, and forbade their conveyance into Paris without special permits. After the revolution of 1789 the republic assumed the guardianship of foundlings. The terrorists decreed (July 4, 1793) that they should be called enfants de la patrie. In 1798, 11,000 francs were assigned toward their support, and it was ordered that two lying-in hospitals should be connected with the foundling house in Paris. But the usefulness of the institution was impaired by a lack of nurses. An imperial decree of Jan. 19, 1811, ordered the establishment of a foundling hospital in each arrondissement of France, to be governed by the following regulations: The children were suckled and weaned in the hospitals, and kept there until the age of six, when they were placed under the charge of peasants and artisans, who received a stipend for their board and training. This stipend was reduced from year to year until the children reached the age of 12, when the able-bodied boys were placed at the disposal of the minister of marine, while for those who were invalids some labor appropriate to their condition was provided in the hospital. They were the property of the state, and those who at the age of 12 had not been taken into the public service were immediately placed under apprenticeship by the administration of the hospital. The expense for nursing and for the outdoor board of the children below the age of 12 was paid by the departments to which they belonged. The expenditure for clothing was paid by the respective hospitals. The number of foundlings annually received in France has varied in recent years from 25,000 to 80,000. The annual number claimed by and restored to their parents is about 6,000, or about 1 in 9. Previous to 1811 the children were deposited in the hands of an officer of the institution; but the decree passed in that year obliged each arrondissement to establish a hospital of deposit, provided with a turning box. In accordance with that decree 256 hospitals were established provided with such boxes, and 17 without them. But many arrondissements removed the boxes and the hospitals of deposit. It was believed that the great increase of foundlings was due to the use of the boxes; hence their suppression. It was discovered that parents put themselves in collusion with those appointed by the hospital to nurse the children or to supply them with board, and it was ascertained that there were mothers who, having discarded their own offspring by secretly depositing them in the turning boxes, managed
FOUNDLING HOSPITAL

349

to officiate as nurses of the institution. The present annual average of children admitted into the Paris hospital is about 5,000. The percentage of illegitimate children is about 28. Provision is also made for the reception of children whose parents are sick or in prison.—In Belgium 12 cities have foundling hospitals, and elsewhere the children are provided for in the country under the supervision of hospital authorities. The foundling hospitals of Tour- nay, Namur, Antwerp, Ghent, Mons, and others, have been suspended. The turning boxes were abolished by law in 1884. In the Netherlands the foundling hospitals and the number of foundlings are not given separately in the statistical reports. Germany has numerous institutions for the care and education of deserted children, but no foundling hospitals proper. The latter are considered unfavorable to morality, and the system has been gradually abandoned. The foundlings of Bavaria are placed in the families of farmers, and are under the supervision of the civil magistrate of the district. The Austro-Hungarian empire has 35 foundling hospitals, in which about 120,000 infants are deposited annually, but nearly 90,000 are cared for outside of the institutions. The 35 lying-in hospitals connected with them contain about 1,500 beds, and receive yearly about 20,000 patients. In Vienna illegitimate children are taken care of in the lying-in hospital, which gives a receipt, stating all particulars, for the deposited child; but unless the mother can prove her poverty, or is willing to serve as a nurse for three months, she must pay from 30 to 100 florins for the admission of her child. There are similar institutions at Prague, Brtnn, and Gratz.—Toward the end of the 17th century proposals for a foundling hospital were made in London, and one was established in 1739, chiefly through the efforts and at the expense of Capt. Thomas Coram, whose portrait and statue now adorn the chapel of the institution. Handel the composer presented it with an organ and gave several performances for its benefit. The hospital was opened June 2, 1758, and adapted to maintain and educate 500 children. But the great influx of children, the large mortality among them, and the abuses consequent upon the facility of admission, led to a modification of the institution; in 1760 it was changed to a hospital for poor illegitimate children whose mothers had previously borne a good character. In 1870 it maintained 504 children, at an expense of £18,775. In 1704 a foundling hospital was instituted in Dublin. In the 30 years preceding 1825 it received 53,150 infants, of whom 14,618 died infants, 28,832 died in the country, where they had been put out to nurse, 730 died in the infirmary after returning from the country, and 932 died grown children, whose mothers had died in the hospital, or at the rate of 4 out of 5. In consequence of this great mortality, the hospital was closed March 31, 1885. The infant orphan asylum at Wan- stead, near London, founded by private charity in 1827, wholly maintains and educates abandoned and orphan children from their earliest infancy to the age of 14 or 15 years. It now has 600 in charge.—In Stockholm, where public prostitution is prohibited, there are 49·01 illegitimate children out of every 100 born, and in the interior of Sweden one out of eight. The Stora Barnhorst hospital of Stockholm, originally established by Gustavus Adolphus for children of military men, is now used as an asylum for infants, who are received without any questions being asked about their parents. Many parents who are fully able to maintain their children send them to it in order to be relieved from the care attending their training and education. There are foundling hospitals in Christiania and other Norwegian cities, and the number of foundlings for the past five years has been more than 9 per cent. of the total number of births.—The foundling hospital of Moscow (Vospitatel'nii Dom) was founded by Catharine II. in 1782. It is an immense establishment, which has been enlarged by a member of the Demidoff family, who contributed liberally to its support. A lying-in hospital is connected with the institution. It has secret wards to which more than 2,000 women have recourse annually. The foundling department admits yearly about 12,000 children, who are not left at the door, but taken openly into a room, where the infant is at once received without any other question than “Has the child been baptized?” and if so, “By what name?” The child is then registered, and a number is assigned to it, which it wears around the neck and which is put on its cot, while the bearer obtains a receipt for which he can claim the child up to the age of 10 years. The mother is permitted to nurse the child. The girls are separated from the boys. About 5,000 children are sometimes in the villages in the environs. The inhabitants of a large village near Moscow are entirely devoted to the bringing up of the foundlings. All children are received, whether foundlings or not, on condition that they are given up to the state. About 50 per cent. of them die before the age of one year, and only one quarter of those brought to the institution reach maturity. The government has of late years established many of them as farmers and colonists on the crown lands. Many of the best Russian engineers have been educated in the institution. Those who display great abilities are sent to the university. The majority of the girls are employed in manual labor, the proceeds of which go partly to the treasury of the institution, and partly saved for them to form their marriage portion; but those of superior ability find opportunities for cultivating it, and may become musicians, actresses, governesses, teachers, &c. All can return to the hospital as old age or any distress in after life. The Vospitatel'nii Dom in St. Petersburg was founded by Catharine II. in 1772, as a branch of that of Moscow, but it now eclipses the parent institution. The small
original endowment has been increased by private donations and by large gifts of the successive czars, and the hospital is now one of the wealthiest landed proprietors in Russia. It forms a little district of its own, near the Fontanka canal, in the best part of St. Petersburg, covering 28 acres of ground. In immediate connection with it is a lying-in hospital. The total number of nurses, physicians, cooks, housekeepers, and other employees is about 6,000. The annual receipt of children numbers about 6,000. The mortality is greater than in Moscow, which is accounted for by the inferior vigor of the nurses who come from the vicinity of the capital. A great many children die on the way to St. Petersburg, some being brought 1,000 miles, from Siberia and Bessarabia. One half of Russia sends its surplus of infantile population to this institution, and the other half to that of Moscow. The children are given in care of wet nurses for about $100, when they are sent into the country until they are six years old. They are then brought back to the institution and educated. In the lying-in hospital connected with the institution the strictest secrecy is maintained. Stringent laws have been passed since 1837, by which the foundlings become the property of the government, and the hospitals in St. Petersburg and Moscow furnish a constant supply of recruits for the army or navy. These establishments are admirably managed; but those in the interior of Russia are inferior. The property devoted to the support, maintenance, and education of foundlings in Russia is said to amount to $500,000,000. Infantile and abortion are exceedingly rare. The proportion of illegitimate births in the whole Russian empire is a little more than 4 per cent.; in cities the average is much larger, and in St. Petersburg and Moscow it is from 20 to 85 per cent.—China has many foundling hospitals, of which those at Shanghai, Ningpo, Canton, and Hangchow are best known. The regulations governing these institutions compare favorably with the best of those in Europe.—One of the most important charitable institutions of the city of Mexico is the casa de niños or foundling hospital. It is supported by private individuals, and the Mexican ladies give a considerable part of their time and attention. When a child has been about a month in the hospital, it is sent with an Indian nurse to one of the neighboring villages. These nurses are subject to a responsible resident of the village, who guarantees their good conduct. The mothers of the children often officiate as nurses, and are paid for their services. When weaned the child is returned to the hospital, but generally the children are adopted by respectable persons.—In the foundling hospital of Rio de Janeiro, the boys, who are brought up in the neighboring establishment at Botofogo, are apprenticed to trades, and the girls are educated in the city establishment. At an early age the children who inquire into his character. If it proves satisfactory, the marriage is permitted, and a small dowry is given from the funds of the hospital. In the United States there are many foundling hospitals except those which have been established and are mainly supported by private charity. Foundlings are sent to the almshouses, whence in many cases they are turned out, and no systematic records concerning them are kept. Several states have greatly reduced the number of foundlings coming under their direct charge, by increasing the efficiency of private asylums through grants of money and land. The foundling asylum of the sisters of charity in New York city was established in 1869. In 1870 the legislature of New York city granted it a site for a building, and appropriated $100,000 toward its erection, on condition that an equal sum should be raised by voluntary contributions. The amount was obtained, and the building was formally opened in October, 1873. From its commencement in October, 1869, to Oct. 1, 1873, the institution received 5,076 infants, of whom 2,037 have died. A crib was placed in the vestibule every night, and during the first month 29 infants were brought to the house, many of them within three hours of their birth. In every instance except one a slip of paper was left with the child, giving its name and the date of its birth. Want of sufficient funds and room made it necessary to refuse infants more than three weeks old, and still many have to be boarded out in the city and the surrounding country. The number admitted during the year ending Sept. 30, 1873, was 1,124. The expenses of the asylum for this year were $118,648; of this amount $80,000 were paid to outside nurses, and about $7,000 for rents and repairs. Accommodations are furnished for homeless mothers with infants. The infants' hospital in New York, established in 1868, on Randall's island, is under the direction of the department of charities and correction. The number of children in the hospital in 1868, was 1,887, of whom 1,089 died; in 1869, 1,518, of whom 710 died; in 1870, 1,177, of whom 499 died; in 1871, 1,098, of whom 297 died. Meanwhile, of the foundlings proper, 70-32 per cent. died, and of mothers children 20-4 of per cent., the death among the former amounted in 1871 to only 25 per cent., and among the latter to about 12 per cent. The decrease is attributed to the removal of the hospital building. The difference of the mortality between the mothers' children and the foundlings is caused by the continual want of a sufficient number of healthy wet nurses. The present ratio of deaths compares favorably with the usual rate of infant mortality in the city. The nursery and child's hospital in New York was founded in 1854, and has a branch on the north shore of Staten Island. Each has a lying-in department. The number of children received in the entire establishment in 1857 was 447, of whom 128 died; in 1871 the total
FOUNDER, or Fouquet, Nicolas, marquis de Belle-Isle, a French minister of finance, born in Paris in 1615, died March 28, 1680. He entered the public service at an early age, became procurator-general of the parliament of Paris in 1650, and was devoted to the interests of Anne of Austria and Madame, by whose influence he was made superintendent of finances. He succeeded for a time in meeting the enormous expenses of the state, already overloaded with debts, but a large deficit in his accounts brought upon him an accusation of peculation. He had in fact amassed an immense fortune, and had spent 18,000,000 francs on one of his châteaux. Louis XIV. had him arrested in 1661 at a fête which Fouquet was giving in his honor; and he was convicted of peculation and treason, Dec. 20, 1664. Colbert, who succeeded him, was the cause of his ruin. Fouquet died at the castle of Pignacol, after 19 years of captivity. Although strictly watched, he contrived to write considerably while in prison, and several works, chiefly on religious subjects, are attributed to him. The documents referring to his trial were published in Holland in 1665—'7 in 15 vols., and a 2d edition in 18 vols., under the title of *Oeuvres de M. Fouquet,* appeared in 1696.

FOUCAULT-TINVILLE, Antoine Quentin, a French revolutionist, born in Hérouel, near St. Quentin, in 1747, guillotined in Paris, May 7, 1795. He studied law in Paris, was for a time procurator at the Châtelet, which place he lost by his misconduct, and afterward obtained that of police clerk. Ruined by vices and harassed by debts, he became an agent for the police, and after the establishment of the revolutionary tribunal, March 10, 1793, was advanced to the post of public accuser before it. From that time till July 28, 1794, he was the indefatigable purveyor of the guillotine. Indifferent to friends and enemies, with equal remorselessness he sent to death Bailly and Danton, Vergnac and Hébert, Marie Antoinette and Robespierre. Soon after the fall of Robespierre the convention brought him to trial, and he was condemned and executed.

FOURCROY, Antoine François, count, a French chemist, born in Paris, Jan. 16, 1758, died there, Dec. 16, 1809. The son of a druggist in reduced circumstances, he tried to gain a living by several callings, but finally, in 1776, became a student of medicine. In 1777 he published a translation of Ramazzini’s Latin “Treatise on the Diseases of Mechanics,” with notes and additions. In 1780 he delivered a course of popular lectures on chemistry and natural history, which attracted a large auditory, and were published in 1781. In 1784 he was appointed professor of chemistry at the *jardin du roi,* now *jardin des plantes,* for which post he had been designated by Buffon in preference to Berthollet. He had been previously admitted to the scientific meetings held at the house of Lavosier, took part in the discussions on systematizing chemistry, and was one of the edi-
tors of the *Méthode de nomenclature chimique*, which appeared in 1787, and marked a new era in the progress of that science. He meanwhile published many papers upon chemistry, and enlarged and improved his lectures. In 1792 he was elected assistant deputy to the convention, and for 18 months devoted his whole time and energy to extracting and purifying saltpetre, which was then much needed in France for the manufacture of gunpowder. During the reign of terror, Desault, Chaptal, and Darcey were indebted to him for their safety; but all his exertions were powerless to save Lavoisier. After the 9th Thermidor, being appointed a member of the committee of public safety, he endeavored to improve the system of public education; he organized the polytechnic school, caused the establishment of three schools of medicine, and suggested the idea of the normal school. On the adjournment of the convention he was elected to the council of ancients, resumed his public discourses on science, and remodelled his lectures, which, under the title of *Système des connaissances chimiques, et de leur application aux phénomènes de la nature et de l'art* (6 vols. 4to or 11 vols. 8vo, Paris, 1801), became "the greatest monument erected to chemical science in the 18th century." Bonaparte appointed him director general of public instruction; under his care the public schools flourished, and no fewer than 800 colleges or lycées were established. The organization of the new university of France was devised by him, and he expected to be appointed grand master; but Napoleon gave the place to Fontanes. This preyed seriously upon his mind, and hastened his death. Besides the works mentioned above, he wrote *La médecine éclairée par les sciences physiques* (4 vols. 8vo, 1791), *La philosophie chimique* (8vo, 1792), *Tableaux synoptiques de chimie* (a large folio, 1805), and many scientific papers in the *Mémoires de l'académie des sciences* and other learned collections.

**FOUR-ARTS**, a fish. See Anarhiks.

**FOURIER, Pierre**, called also Pierre de Maligncourt, a French religious reformer and founder, born at Mirecourt, Lorraine, Nov. 80, 1665, died in Gray, Franche-Comté, Dec. 9, 1640. After having graduated in the university of Pont-à-Mousson, he became a canon regular of the order of Prémontré in the abbey of Chamonse, near Épinal. In 1595, the persecutions of the degenerate monks having forced him to leave the abbey, he was appointed at his own request pastor of the parish of Maligncourt, where his zeal for the education of the poor and his exemplary life soon produced wonderful fruits. He opened a school in his residence, established free schools in the most populous localities, and laid the foundations of a network of schools in the province of Notre Dame for the education of young girls. This society was confirmed by Paul V. Oct. 6, 1616, and soon spread all over France and into Canada. In 1621 he was associated by Gregory X V. with Jean de Perezet, bishop of Toul, for the purpose of effecting a reform of the order of Prémontré. Having persuaded the canons of St. Mary in Pont-à-Mousson to enter into the views of the pope, Fourier went with them to the abbey of St. Remi in Lamouville, where after the ordinary novitiate they bound themselves by solemn vows to a new congregation called St. Saviour, one of whose main obligations was to educate Christian youth. In a few years there were nine houses of these reformed canons, and in 1632 Fourier was elected superior general. The king of France having taken possession of Lorraine in 1694, Fourier and his followers were compelled to seek an asylum in Franche-Comté. They settled in Gray, and there Fourier continued to labor with ever-increasing energy and fruit until his death. He was beatified Jan. 29, 1730, and is generally spoken of as Blessed Peter Fourier. The order was suppressed at the revolution. Of late years an effort has been made to restore the canons regular of Prémontré with the rule of Fourier. The society of Notre Dame (not to be confused with the sisters of Notre Dame de Namur) in America has its central house in Montreal, and possesses flourishing establishments in New England and Chili.

**FOURIER, François Marie Charles**, a French writer on social science, born in Besançon, April 7, 1772, died in Paris, Oct. 10, 1837. From his earliest infancy he manifested a singular originality and force of character. At school he was diligent and quick to learn. The prizes for French themes and Latin verse are assigned to him in the records of the town school for the year 1785. But his favorite early studies were geography, botany, and music. His pocket money was spent in buying globes and charts, and much of his leisure time he devoted to the cultivation of flowers. He was sufficiently master of music to be enabled to construct a new musical notation by which all the different voices and instruments may give the same name to the same note, instead of employing seven or eight different keys or particular scales. On leaving school he was sent to Lyons, where he entered as clerk in a commercial house; but having a desire to travel, he engaged soon after with a house whose business connections extended over France, Germany, Switzerland, Holland, and Belgium. This gave him the opportunities for observation which he desired. In 1793, having received about 100,000 francs as his share of his father’s property, he began business for himself in Lyons, embarking his whole fortune in colonial produce, which he purchased at Marseilles, and expected to sell at the former city. But just then the troops of the convention occupied Lyons, and pillaged the inhabitants, taking the greater part of Fourier’s fortune. The Lyonnese rose against the revolutionists, and Fourier joined them, but the insurrection was promptly suppressed. Fourier was cast into prison for five days, hourly expecting to be led out to the guillotine, and only escaped
FOURIER

by accident. Flying to Besançon, he was again incarcerated as a suspicious person. By joining the revolutionary army, he was enabled to exchange the cell for the saddle, and served nearly two years as a trooper in the army of the Rhinc. He obtained his discharge on account of ill health, Jan. 24, 1790. During his connection with the army he made important military suggestions to the government, for which he received its thanks through Carnot. Subsequently also he attracted the attention of Gen. Bonaparte by a political essay put forth in a local journal. On regaining his liberty, he resumed his commercial pursuits. Employed in a wholesale warehouse at Marseilles, he was chosen to superintend a body of men while they secretly cast an immense quantity of rice into the sea. France had been suffering from scarcity during the year, and these monopolizers had allowed their stores to rot rather than sell them at a reasonable profit. Fourier afterward devoted himself to the study of the means of effectually preventing such abuses of monopoly. In 1799 he believed that he had discovered "the universal laws of attraction," and the essential destiny of humanity upon earth. He spent many years in elaborating these discoveries; his first work, called *L'abondance des quatre mouvements et des destinations générales*, was not published till 1808, when he issued the first volume, which was merely a prospectus of the work, intended to procure the means of publishing the rest by subscription; but France being then agitated by the projects of Napoleon, no attention was given to it. It did not make a singleconvert till 1814, when a copy of it fell into the hands of Muiron of Besançon. As it bore the imprint of Leipsic, without the name or address of the author, it was a long time before he was able to find out Fourier, who then resided at Belley. Muiron afterward assisted him in the preparation and publication of his works. In 1822 Fourier removed to Besançon, and published the first two volumes of his work under the title of *Traité de l'association domestique agricole*, which in its latest form appeared under the more imposing title of *Traité de l'Unité universelle*, and was the great work of his life. As originally conceived, it was meant to embrace nine volumes, in the following order: 1, the abstract principles of passionate attraction, and their partial application to industrial associations; 2, familiar synthesis of the principles of attraction, and their equilibrium in practice; 3, the analysis of man's physical, moral, and mental nature, individually and collectively, with regard to individual society and universal unity; 4, methodical synthesis and transcendental theory; 5, commercial duplicity and ruinous competition; 6, the false development of human nature, and a regular analysis and synthesis of a false development of universal nature, as an exception to universal harmony; 7, universal analogy and illustrations to cosmogony; 8, the scientific theory of the immortality of the soul; and 9, dictionary of contents and references to the whole work. Two volumes only were printed at Paris, and these attracted no attention. Five years later Fourier drew up a brief summary of his contents under the title of *Nouveau monde industriel et sociétai*, in the hope of getting them into notice in that way. In 1811, when the St. Simonians began to make a stir in France, Fourier, who had established himself in Paris, published a pamphlet against them and the followers of Robert Owen, accusing them of utter ignorance of social science, and of gross charlatanry in their pretensions; and from that time his writings began to receive the attention of minds inclined to such studies. Many of the disciples of St. Simon, seeing the more precise and scientific nature of Fourier's socialism, abandoned their old master for this new teacher. On June 1, 1829, a journal of the socialistic doctrines of Fourier was begun under the name of *Le Phalanstère*. A joint-stock company was formed to realize the new theory of association, and one gentleman, M. Bandet Dulary, bought an estate at a cost of 500,000 francs. Operations were commenced, but for the want of paying shareholders the community dispersed. In 1833 Fourier published another work, *La fausse industrie, morcelée, répugnante et mensongère*, et l'antidote, *l'industrie naturelle, combinée, attrayante, vériqude, donnant quadruple produit* (1 vol. 8vo); but it added nothing to his original discoveries. He was about to publish a second part when he died. On his tomb are engraved the three fundamental axioms of his doctrine: *La série distribue les harmonies; Les attractions sont proportionnelles aux destinées; Analogie universelle*. He was buried in the cemetery of Montmartre in Paris. His friends had meanwhile replaced the *Phalanstère*, which was short-lived, by *La Phalanse*; and when the subject had created an audience for itself, a daily paper, *La Démocratique Pacifique*, was established, under the editorship of Victor Considérant. This maintained the propagation till it was discontinued during the reactionary movements which followed the revolution of 1848.—Fourier's doctrines obtained some vogue in France, where a school was regularly organized for their diffusion. At the head of it were Considérant, Cantagrel, Victor Hennequin, Laverdant, Victor Meunier, and other ardent young men. In England Hugh Doherty placed himself at the head of the movement, and established a weekly paper called "The Phalanx," while in the United States Albert Brisbane, by his vehement expositions of the subject, gave to it an immense éclat and temporary success; but of late years it has died out of the public mind. Nevertheless, the scheme of Fourier deserves notice. He was a man of the noblest humane impulses, of rare acuteness and sagacity, and of original imagination. His negative criticisms of the disorders, the falsehoods, and the
miseries of society, are a fearful exposure of the ulcers of our imperfect civilization; and even those who reject his more positive notions will find abundant material for thought in these exposures. The fundamental and leading principles of Fourier are summed up in the following short formulas: "1. The series distributes the harmonies of the world. 2. Attractions are proportional to destinies. 3. Analogy is universal." In other words: 1, all the harmonies of the universe grow out of a regular and uniform order, which Fourier denominated the law of the series; 2, all beings are led to and kept in their true sphere, not by a principle of external force, but of internal attraction; 3, the universe, being everywhere the same, constructed upon the same infinite model, and according to the same eternal laws, must in every sphere repeat itself, or be analogous. These general principles or deductions Fourier carried out into all branches of science, but his chief application of them was to social science. Society being composed of men, he began with an analysis of human nature, of human impulses and attractions. The permanent principles of nature were three: 1, the active principle, or spirit; 2, the passive principle, or matter; 3, the neutral principle, or the mathematical laws of justice and harmony. The nature of man was coordinate with this division, and contained: 1, his physical nature, adapted to the passive principle, or matter; 2, his moral nature, adapted to the active principle, or spirit; 3, his intellectual nature, adapted to the neutral principles of law and justice. The common object of all his physical desires is sensual enjoyment; the common object of his moral, mutual affection; the common object of his intellectual, order and association; while over all presides a superior tendency to unity or universal harmony. The essential faculties of the soul, then, or impulses to action or life, Fourier analyzed into five sensual "passions," four moral passions, and three intellectual passions. Thus:

Sensuous faculties, or modes of enjoyment.

1. Sight, or desire for enjoyment of color, etc.
2. Hearing, or desire for the pleasures of sound.
3. Taste, or desire for delights of the palate.
4. Smell, or desire for agreeable odors.
5. Touch, or desire for external ease, etc.

Moral affections.

6. Friendship, or the affection of equals.
7. Love, or the affection of the sexes.
8. Paternity, or the family affection.
9. Ambition, or the affection of society.

Intellectual impulses.

10. Cabalistic or emulative impulse.
11. Alternating or varying impulse.
12. Composite or combining impulse.
13. Unityism, or harmonizing aspiration.

These simple and essential desires of the soul, according to Fourier, may all be directed into a contrary and subversive development by the unnatural action of circumstances. In the false conditions of society they become so many uncontrollable and warring appetites. What they want for their rectification and true development is a social sphere adapted to their harmonic action. Society must be constituted according to the same law of groups and series which harmonizes universal nature. The association of the three principal agents of production, that is, of capital, science, and labor, for the mutual advantage of each member of such association, in the several branches of agriculture, manufacture, commerce, domestic industry, art, science, and education, would prepare the way for this true society. The economies effected in expenditure and consumption would be prodigious; the distribution of labor and of its result would become gradually very exact and equitable; the pleasures of combined and varied exertion would take from it all its monotony and its repulsive aspects; while the skill, the wisdom, the grace of every member of the association would be always available to the benefit of every other member. The unity of the association would be expressed in the common domain and combined dwelling house (the "phalanstery"); the variety, in the separate apartments, the different labors, the individual tastes. A township of about 1,800 persons, male and female, Fourier regarded as the germ of larger combinations, which would interweave and unite themselves together, step by step, until a network of connected associations, bound by the same principles, and governed by a syndic or council of representatives, would be spread over a state, a nation, Europe, the globe. But this grand and world-embracing harmony would be the result of no instantaneous or speedy change, but of a regular development of the combined order, according to the law of the series. Society, he said, passed through a process of regular growth, from its most infantile condition to its highest maturity, when it would again begin to decline, and finally fall into decrepitude and decay. In this it resembled the growth of the individual man, who had his ascending vibration, or advance from infancy to youth, from youth to manhood, from manhood to old age, and then by a descending vibration from old age to death. This universal career of humanity Fourier distributed in the following order: two phases of incoherence, containing each seven social periods; two phases of combination, containing each nine social periods; grand total of 52 social periods or societies. The first seven of these periods, embracing the history and progress of the world up to the present time, he named: 1, Edensism; 2, savagery; 3, patriarchalism; 4, barbarism; 5, civilization; 6, guaranteeism; and 7, simple association. Five of them, as the records of all the earth prove, have been periods of constraint, poverty, oppression, fraud, carnage, and false science; the other two are the foible days of a better day ushered in by associations of joint interest and reciprocal guarantee. But as soon as society shall have reached them, a higher and composite order begins, when seven other periods, distinguished by successive creations of har-
monic beings, will give happiness to all the world. Then comes the plenitude and apogee of harmony, the pivotal or amphiharmonic age of the race, which nature will recognize by the conversion of the aurora borealis into a boreal crown, encircling the earth as the rings of Saturn encircle that planet, the stationary position of the elliptic, and the disinfection and perfuming of all the waters of the seas, by means of the boreal fluid. This supreme condition of nature and man will continue for about 8,000 years, when the beam of happiness will again descend, and society pass through a series of declines, similar to the series of its advances. The earth itself will be smitten with a palsy of weakness, and after many convulsions sink into death. The human race, however, will not perish, but by a series of bicomposite transmigrations attain to immortality in other spheres. Fourier was rigidly true to his method in all departments of inquiry, and applied it with the most intrepid and unhesitating fidelity, whatever the conclusions to which it might lead. His cosmogonical and ultramundane speculations therefore assumed often the most grotesque forms; and yet his disciples found so much beauty in his social scheme, that they endured his aberrations for the sake of the comprehensive ideas which he suggested.—His collected works (8d ed., 6 vols., Paris, 1841—'5) do not include all his writings. Some transcendental speculations have since been published separately; others still remain in manuscript.

FOURIER, Jean Baptiste Joseph, Baron, a French savant, born in Auxerre, March 21, 1768, died in Paris, May 16, 1830. He was professor of mathematics at Auxerre, afterward a teacher in the polytechnic school at Paris, and in 1799 a member of the scientific commission in Egypt. In 1802 he was appointed prefect of the department of Isère, and in 1808 made a baron. By the Memoirs of the province of Burgundy he freed more than 40 communes from the pestilential malaria to which they had always been subject. On the return of Napoleon from Elba, he issued a proclamation in favor of Louis XVIII., and was removed by the emperor, who however appointed him prefect of the department of the Rhône. In 1817 he became a member of the academy of sciences, and soon afterward perpetual secretary jointly with Cuvier, and in 1827 member of the French academy. Upon the death of Laplace in 1827 he became president of the conseil de perfectionnement in the polytechnic school. His principal works are Théorie analytique de la chaleur (1822), and Analyse des équations déterminées (1831), a posthumous publication, but written in his youth.

FOURTEEN, Benoît, a French inventor, born in St. Etienne, Oct. 81, 1802, died in Paris, July 8, 1867. He was educated at the school of mines in his native city, and upon leaving it in 1819 was employed in the mines of Creuzot, and invented the turbine. His first turbine was exhibited with great success at Inval, near Gisors, in 1834, and the prize of 6,000 francs, which had for nine years remained unawarded, was bestowed upon him by the academy of sciences. His proposal to establish several of these machines in the Seine at Paris, for the purpose of supplying every part of the city with water, as well as of filling the ditches which surround the fortifications, was commended by Arago. He published Mémoires sur les turbines hydrauliques, et leur application en grand dans les usines et manufactures (Liège, 1841), and a Table pour faciliter les calculs des formules relatives au mouvement des eaux dans les tuyaux de conduite (Liège, 1844).

FOURNIER, Édouard, a French author, born in Orleans, June 16, 1819. He early devoted himself to literary labors, and produced many plays alone or in collaboration with others. One of his best efforts is Cornelle à la butte Saint-Roch (1882); his drama Gutenberg was favorably received in 1886 at the Odéon, after having been rejected by the Théâtre Français. His writings relate to a great variety of subjects, and he has edited many voluminous publications and reviews. His best known works are: L'Esprit des autres (1865); 4th enlarged ed., 1861); L'Esprit dans l'histoire (1867); 2d ed., 1860); and Le vieux-neuf; histoire ancienne des inventions et découvertes modernes (3 vols., 1869).

FOWLER, L. Orson Squire, an American phrenologist, born in Cohocton, Steuben co., N. Y., Oct. 11, 1809. He graduated at Amherst college in 1834, and immediately began to lecture on phrenology. In 1835 he and his brother Lorenzo opened an office in New York. In 1836 the two wrote and published "Phrenology: Proved, Illustrated, and Applied." "The Self-Instructor in Phrenology and Physiology" (1849) is also their joint production. In October, 1838, he was in Philadelphia the first number of the "American Phrenological Journal," which was published in that city till 1842, when it was removed to New York, and continued by the firm of O. S. and L. N. Fowler, which became Fowlers and Wells in 1844, and, by the retirement of the Fowlers, S. R. Wells in 1866. Meantime Mr. Fowler has pursued, as editor, lecturer, and author, a career of unusual activity, lecturing in almost every part of the United States and Canada. The entire years 1873 and 1874 were devoted to lecturing in California and on the Pacific coast. In 1883 he removed to Boston, where he now resides (1874). Among the many volumes on phrenology and kindred subjects which he has published, may be mentioned "Memory and Intellectual Improvement applied to Self-Education" (1841); "Physiology, Animal and Mental, applied to Health of Body and Power of Mind" (1842); "Matrimony, or Phrenology applied to the Selection of Companions" (1842); "Self-Culture and Perfection of Character" (1843); "Hereditary
Descent, its Laws and Facts applied to Human Improvement" (1843); "Love and Parentage applied to the Improvement of Offspring" (1844); "A Home for All, or the Gravel Wall and Octagon Mode of Building" (1849); and "Sexual Science" (Svo, Philadelphia, 1870).

II. Lorenzo Niles, brother of the preceding, born in Cohocton, June 23, 1811. His early history is almost identical with that of his brother, with whom he accompanied on his lecturing tours. He has also lectured alone in all the considerable towns of the United States and the British American provinces. In 1868 he went to London, where he now resides (1879) and has lectured in all parts of Great Britain. Several of his lectures have been published in London, but not reprinted in the United States. In addition to the works written in connection with his brother, he is the author of the "Synopsis of Phrenology and Physiology" (1844), and "Marriage, its History and Philosophy, with Directions for Happy Marriages" (1846). As a member of the firm of Fowlers and Wells he was engaged in publishing "Life Illustrated," a weekly journal, and the monthly periodicals, the "American Phrenological Journal" and the "Water-cure Journal," which has been superseded by the "Science of Health." III. Lydia Felger, wife of the preceding, born in Nantucket, Mass., in 1838, died in London, Jan. 26, 1879. She was a graduate of the Syracuse medical college, and practised medicine. She also lectured frequently on physiology and the diseases of women and children, and was the author of "Familiar Lessons on Phrenology and Physiology" (1847), and "Familiar Lessons on Astronomy" (1846).

FOWLING PIECE, a weapon used by sportmen for killing small game. It has always been, among dilettanti addicted to hunting as a pastime, the object of much extravagant and capricious fancy. Like bibliomania, the passion for sporting weapons is often concerned with the extrinsic rather than the intrinsic merit of its object; and weapons by particular makers are valued like the handiwork of the Elvaise and Fouilys, and for similar reasons. The barrels are the most important part of this weapon, and in their construction the maker endeavors to secure the greatest possible lightness consistent with the requisite strength. Before the invention of cast steel, and before the manipulation of that metal was well understood, wrought iron only was used. The iron obtained from the Catalan forges and bloomeries, so generally used a century ago, was, from the nature of the process and materials, of excellent quality. The old habit of saving and reworking scrap iron of all forms tended further to improve it; and it is not surprising to find that, for gun barrels requiring the best iron, small scrap, like old nails, wire, and waste clippings of metal, should have been resorted to. Old horse nails (stubs) were viewed with especial favor, and popular tradition attached some mysterious virtue to the iron which had performed service in a horse's hoof; they were always saved by farriers with scrupulous care, and sold to the gun makers. The real utility of such material, aside from the quality due to repeated manufacture, lies in the fact that the damask, or shading of barrels, cannot be obtained without using small pieces of iron, which must be welded together, and drawn down into rods under the hammer; and, when twisted and worked into the barrel, must be etched with acids. In welding together these small fragments, a film of cinder forms upon the surface of each; and in the subsequent forging, drawing, or twisting, this film constitutes a vein in the metal, and is made visible by its darker color and the greater facility with which it is dissolved by acids. When the value and properties of cast steel became known, this metal was used in gun barrels, at first in small quantities, but gradually to the extent of three fourths; and finally the highest grade of workmanship involved the use of steel alone. 1. Damask (or "Damascus") barrels are made of metal prepared in the following manner: Alternate strips or layers of soft wrought iron and steel are piled together, and drawn down into rods of an inch square. These rods are then twisted to an extreme degree, until the original angles describe 16 to 20 turns around the axis of the rod in every inch of its length. They are again squared, and three of them are welded together laterally, and drawn into a rod about half an inch wide and a quarter of an inch thick. 2. Wire twist is piled in the same manner and with the same materials as damask, but is drawn into rods three eighths of an inch wide, and of variable thickness. They are not subjected to torsion, like damask, but are hammered at once into the gauge required for coiling, so that the alternating layers of iron and steel may appear like a series of consolidated wires, running around the barrel. 3. The stub twist is forged from a mixture of iron and steel, clipped into shreds, heated, tilted, and rolled into a small rod. This rod is cut into short lengths, which are piled, and drawn into a ribbon of suitable dimensions for coiling. 4. Stub damask is made from the same materials as stub twist, but the rods after the first drawing are subjected to a high degree of torsion, and two or three of them are then welded laterally to form the ribbon. 5. Charcoal iron, or carbonized iron, for barrels, is made from the punchings and clippings of plate and sheet iron, melted and cast into an ingot, which is rolled into rods, the same as stub twist. 6. Three-penny skelp is made by fagoting scrap iron, without steel, heating it in an air furnace, and forging it into small rods, which are cut up, and again tilted into the proper form. 7. Two-penny or Wednesbury skelp is similar to the foregoing, but a lower grade of scrap is used. 8. Sham-dam skelp is common wrought iron, forged at once into the ribbon, and intended only for the commonest article of trade. Of the foregoing varieties
the stub twist is the best, though a good wire twist, if perfectly sound, is fully equal to it; but the latter is more liable to imperfect welding, and the barrels made from it have been known to break transversely; but this is a rare occurrence, and they are not liable to burst. The damask and stub damask are, when skillfully made, very beautiful barrels, of great strength, and slightly inferior to the stub and wire twists. The most curious and elegant damask is made at Liège, and many beautiful specimens are produced at Birmingham in England, at Vienna, Geneva, and Berlin. Of all barrels, those of laminated steel combine in the highest degree lightness and strength, and, though less curious and elaborate in their damaskeening than the true damask, are yet very handsomely shaded. They are made by piling alternate sheets of steel and wrought iron, the former being much the thicker, and hammering the pile down until the lamines are exceedingly thin. The lamines are disposed in wavy forms, and the disposition is varied in many ways. Torsion is sometimes given to a moderate extent; but an extreme degree of it is avoided, as it tends to diminish the absolute strength of the ribbon. The ribbons of various materials are coiled into the form of the barrel, around a mandrel, and the edges of the helix are welded together, about three inches at a heat, by "jumping" the coil on an anvil. The various kinds of barrels made at Birmingham are characterized by the width of the ribbon used for the coil. Thus, the width of the Birmingham damask ribbon is \( \frac{3}{4} \) of an inch; of the stub twist, \( \frac{1}{2} \); of the stub damask, \( \frac{3}{4} \); of the charcoal iron, \( \frac{1}{2} \); of the three-penny skewel, \( \frac{3}{4} \); of the two-penny skewel, 1 inch; and of the sham-darn, 1 1/2 inch. Most frequently the latter is not twisted at all, but is lap-welded at once into a tube. These dimensions, together with the texture of the etching (when the etching is genuine), are of assistance in identifying the structure. The Liège damask is usually much smaller, both in diameter and in width of helix. Barrels are frequently veneered with damask over a tube of inferior metal, and this deception is difficult to detect in many cases, so artfully is the barrel covered not only in its cylindrical part, but at the ends. But first-class makers never resort to this trick. Veneered barrels are usually thicker and heavier than the varieties they are intended to simulate. It is obvious that a barrel of sufficient strength can be made of the poorest of the foregoing qualities, if the sportsman is willing to tolerate an increased weight; but a sham-darn or two-penny skewel, no thicker than a stub-twist of the best quality, would be nearly as dangerous to the hunter as to his quarry. Excellent barrels are now made of Bessemer and Siemens Martin steel, rivalling all but the laminated steel in absolute strength. They are perfectly plain, without weld or damask, and are made very cheaply, in the same manner as musket barrels (see Musket), by drawing a hollow cylinder of steel to the proper dimensions over a bulbous mandrel. The two barrels of a double-barrelled fowling piece are united by brazing or soldering to an intermediate rib. The taper of the barrels is such that in setting the two axes converge at a point about 40 yards in front of the muzzle. With this degree of convergence, the cross sections of the rib should be uniform at all points. The best and lightest barrels are usually finished externally in such a manner that a line drawn from breech to muzzle is slightly convex towards the axis of the barrel, and concave outward, and in this case the rib requires very skilful fitting. The lock of the piece is the member most liable to derangement by use. It should be of simple construction, and rather massive. A light, delicate lock should be regarded with suspicion. The points most worthy of attention are: 1. The method of attaching the main spring to the tumbler. The pivots should be large and strong, and fitted with precision. The hammer should be set, with reference to the main spring, in such a manner that the spring may exert its most direct action and greatest force when the hammer is down. 2. The pivot of the sear should be set so that it will be disengaged freely by the trigger, without danger of wearing too much, and at the same time be in no danger of catching at the half-cock notch. 3. The main spring should be attached to the lock plate so that it can be removed readily, and a new one substituted by a good workman. This spring is liable to lose its tension by age, whether in use or not.—Within the past ten years breech-loading fowling pieces have come into general use. That they are more convenient than muzzle-loaders cannot be questioned, and there is no material point in which they are objectionable, excepting the greater cost of weapon and ammunition, which is more than compensated by their great advantages. A serviceable breech-loader involves the use of prepared cartridges, well primed and enclosed in cases of metal or other strong material; copper or brass cases are much the best, since they can be made to enter the chamber loosely, and the elasticity of the metal allows a temporary expansion during the act of discharge, without producing any permanent enlargement, thus permitting the case to be readily extracted afterward. The metal case, moreover, forms a perfect gas check. Papier-mâché cases are objectionable, because they are liable to change their dimensions, expanding when long exposed to dampness, and contracting when they dry. Many ready-primed cartridges are liable to failure through a deterioration of the priming. This is a paste containing mercury fulminate, and the most frequent cause of deterioration is a feeble but continuous voltaic action, which is generated when the fulminate is in contact with two kinds of metal. If a single kind of metal is used (either copper or brass) to form the re-
mixture of soft fur, the temporal crests always widely separated, and the under jaw with an angular emargination below. —The common American red fox (V. fulvescens, Deeu.) has long, silky fur, with a full bushy tail tipped with white; the color is reddish yellow, grizzled with gray on the lower back; throat and narrow line on the belly white; back of ears and tips of the hair on the tail (except the terminal brush) black. The cross fox, the variety decussatus (Geoff.), has the muzzle, lower parts, and legs black, the tail blacker, and a dark band between the shoulders crossed by another over them; this is found from northern New York to Canada and northern Michigan and Wisconsin, while the red variety occurs from Pennsylvania to Canada, and from the Atlantic to the Missouri. The silver or black fox, variety argentatus (Shaw), is black, except on the posterior back, where the hairs are ringed with gray, and the tip of the tail is white; this is found in Washington territory. The European red fox is a different species, the fur being less soft and long, and the tail less bushy and more tapering; the muzzle is longer, the eyes further apart, and the feet more slender; the red color is darker and the tint more uniform, with little of the golden hue of the American species; the space where the whiskers are inserted is white instead of dusky, and there is more white on the throat and belly; this is the V. vulgaris (Briss.); it is found from Spain to Norway, and from Great Britain to eastern Russia. These species and varieties vary in length from nose to root of tail from 24 to 30 in., and the tail to end of hair from 16 to 20 in. From the fact that in the bone caves of the United States no skulls of the red fox have been found, while those of the gray fox are common, it is believed by many naturalists that the American red fox is a descendant of the European V. vulgaris. The skin of the red fox is worth about $1.75, that of the cross fox about...
two or three times as much, and that of the black fox much more; but prices vary much according to the caprices of fashion. The American red fox, being a northern species, is rarely hunted by horses and hounds; as the nature of the country would generally render this sport impossible, and the people will not permit their standing grain to be trodden down by man and beast. In Great Britain and Ireland, on the contrary, the sport of fox hunting is one of the most popular amusements of the higher classes.—The prairie fox (V. macrurus, Baird), the largest species known, inhabits the central portions of North America, and is noted for the beauty of its fur; its general color is like that of the red fox, and it seems to run into the variety of a cross fox; the tint is yellower, and there is more white below; the tail is uncommonly full and hairy; the skull is characterized by a muzzle as much longer than that of the red fox, as is the muzzle of the latter than that of the European species. The kit or swift fox (V. velox, Say) is smaller than the red species; the head is short and broad, the ears small, and the legs short; the tail is very dense and bushy; the general color above, including the ears and tail, is yellowish gray, grizzled on the back, sides pale reddish yellow, below whitish, and tail black-tipped. The arctic fox (V. lagopus, Linn.) is chiefly confined to the arctic regions of both hemispheres, and has rarely been seen within the limits of the United States, though it has occasionally been found in Newfoundland; it is smaller than the red fox, with a very full and bushy tail, the soles of the feet thickly furred, and the pelage fine and dense; in the adult the color is white, in the young grizzly leaden. We are familiar with the appearance and habits of this species through the narratives of arctic explorers.—The gray fox (V. Virginianus, Schreb.; urcoyn, Baird) has the head and body about 28 in. long, and the tail 14 or 16 in.; the tail has a concealed mane of stiff hairs. The color is gray varied with black; sides of neck and flanks fulvous; hand encircling the muzzle black; throat white; tail hoary on the sides, rusty below, black at the tip. The head is shorter and the body stouter than in the preceding section, and the fur is much coarser. It is decidedly a southern species, being rare north of Pennsylvania, and common from that state southward, and from the Atlantic to the Pacific; it is less daring and cunning than this red fox, and rarely visits the farm yard; it invades the nests of the wild turkey, pounces upon coveys of quails, and gives chase to the rabbit like a dog. When pursued by hounds in open woods, where it cannot skirt through thick underbrush, it will very often climb a tree. In general this species does not dig a burrow, preferring a hollow log or a hole in the rocks for its den; it is often caught in steel traps, and as a pet is less playful and less colorful than the red fox. Its windings when chased afford good sport for the hunter, and its chase with horses and hounds in the southern states, where the ground is favorable, is much relished as a healthful exercise and exhilarating pastime. In Carolina this species produces from three to five young at a time in March or April. The short-tailed fox (V. or U. litteralis, Baird) is about half the size of the gray fox, with the tail only one third the length of the body; it resembles a miniature gray fox, of about the size of a house cat, though of stouter body; it was found on the island of San Miguel, on the coast of California.—Other species of fox exist in Nepal, in the Himalaya mountains, in Syria, and in Egypt, named respectively V. Hodgsonii (Hardw.), V. Himalayicus (Ogilby), V. thalab (H. Smith), and V. Niloticus (Geoff.).

FOX, Charles James, an English statesman and orator, born in London, Jan. 24, 1749, died at Chiswick, Sept. 18, 1806. His father, Henry Fox, afterward Lord Holland, had amassed a great fortune as paymaster of the forces; his mother was a daughter of Charles,
the second duke of Richmond, and by her he was descended from Charles II. of England and Henry IV. of France. It is said that his father, when he was about 14, having taken him to Spa, gave him five guineas a night to play with; the source, perhaps, of his invincible attachment to gaming. He studied at Wandsworth and Eton, where he impressed his schoolfellows with a conviction of his superiority. From Eton he went in 1764 to Oxford. Here he gamed, studied, and spent profusely the lavish allowance given him by his father. He read Homer and Longinus, and gained a good knowledge of Greek. In later years he was able to repeat long passages from Homer. Leaving Oxford without graduating, he went to the continent in 1766. During his residence abroad he taught himself Italian, and contracted a partiality for Italian literature which lasted through his life. In August, 1768, he returned to England, where he had been elected to parliament in his absence, while yet under age. He took his seat as a supporter of the duke of Grafton's ministry, following the political faith of his father, and made his first speech in the house April 15, 1769. In February, 1770, he was made a junior lord of the admiralty, but resigned in 1772. In January, 1773, he was made one of the lords of the treasury, but came into collision with the premier, and was dismissed Feb. 28, 1774. After his father's death Fox joined the opposition, and was an eloquent assailant of the leading measures of the ministry. He foretold the defeat of the British arms in America, and stood by Edmund Burke in the struggle against the policy of Lord North. In the beginning of 1780 Burke brought forward his plan of economical reform, which was zealously supported by Fox; this was rejected by the house, but resolutions were passed for an inquiry into the public expenditure. Fox supported Pitt's motion for parliamentary reform in May, 1782, and introduced a measure of concession to Ireland. When the ministry of Lord North fell in this year, Fox was made secretary for foreign affairs, and undertook to secure peace with the hostile powers, and the recognition of the independence of the United States. The negotiations were interrupted by the death of the marquis of Rockingham, the prime minister; and when Lord Shelburne took the head of the ministry, Burke, Fox, and several of their associates resigned. In April, 1788, Fox came again into power as foreign secretary in the coalition which he had made with his former enemy, Lord North, and on account of which much odium was cast upon him. On Nov. 18 he introduced his bill designed to relieve the sufferings of India, which he pressed with his usual warmth, and aided by Burke it passed the commons; but the lords, the crown, and the India company being against him, the coalition fell, and the ministry were dismissed, Dec. 18. On resolutions introduced by Fox, there was a decided majority against the new ministry, and parliament was dissolved. Fox stood for Westminster, against the whole influence of the court and ministry, and was declared elected by a large majority; but the unsuccessful candidate demanded a scrutiny of the vote, and the high bailiff took upon himself to make no return of representatives for the city. The returns being delayed for about a year, Fox entered parliament for a Scotch borough. The high bailiff was afterward fined £2,000. Fox finally triumphed, and the nation was now divided into two parties, that of Fox and that of the king. On April 22, 1788, Fox opened the Benares charge against Warren Hastings, in whose impeachment he aided Burke and Windham. When in 1788 George III. became insane, Pitt advocated the appointment of a regent by parliament, but Fox maintained the right of the prince of Wales, afterward George IV., as indefeasible. The recovery of the king ended the discussion for the time. Fox moved, March 2, 1790, the repeal of the corporation and test acts. A lack of sympathy on this subject, as well as in regard to the principles of the French revolution, arose between him and Burke, and led to their formal separation, May 6, 1791. Fox was in earnest sympathy with liberal principles, and in 1791 aided Wilberforce in his efforts to abolish the slave trade. He introduced a bill defining the powers of juries in trials for libel, which was passed in April, 1792. In 1798 he supported Grey's motion for parliamentary reform, and soon became a leader of the reform party. This party was in a hopeless minority, and finding his opposition in the house of commons useless, he ceased to attend its sessions in 1797; and in 1798 he was struck from the list of privy councillors for having repeated the duke of Norfolk's toast, "The majesty of the people." From 1797 to 1802 he passed his time chiefly in retirement. He planned an edition of Dryden, a defence of Racine and the French stage, a refutation of the historical theories of Hume, and a history of the revolution of 1688. His researches for this last work took him to Paris in 1802, and while there he was treated by Napoleon with marked distinction. Only a portion of the proposed history of the revolution of 1688 was ever written; it is chiefly notable from the fact that Fox would not use any word which had not been used by Dryden. Returning to parliament, he united with Pitt against the Ad- dington ministry, but upon its fall, when Pitt wished to form a new ministry, Fox was expressly excluded by the king, and Pitt was obliged to make his selections from the subordinates of his predecessor. This ministry was dissolved by Pitt's death, Jan. 23, 1806, and Fox became secretary for foreign affairs in the new ministry formed by Lord Grenville. During his short service of only seven months, Fox procured a vote in the commons for the abolition of the slave trade, and entered into
negotiations for peace with France. Fox was one of the most brilliant and successful of debaters. His personal appearance was fine, and his manner impassioned and convincing. His recklessness dissipated his estate, and during a large part of his life he was continually in debt. Yet such was the sweetness of his temper, the generosity of his disposition, and the magnanimity of all his conduct, that he was loved and honored by the purest men of the time. Burke loved him as his chosen friend; with Wilberforce he labored side by side in the cause of humanity; and even the austere Johnson boasted of his friendship. In his political principles he was firm and unbending; no emotion of ambition took him from the path of honor; no opposition terrified or discouraged him. He gave to the whig party of England its distinguishing principles; he originated those measures of reform in the constitution which have finally been adopted; and probably no other statesman has had so large an influence upon the politics of England. Mackintosh says of him: "He certainly possessed, above all moderns, that union of reason, simplicity, and vehemence which formed the prince of orators. He was the most Demosthenian speaker since Demosthenes."—See "Character of the late Charles James Fox," by Dr. Samuel Farr (2 vols. 8vo, London, 1800); "Speeches in the House of Commons by C. J. Fox," with a biographical and critical introduction by Lord Erskine (6 vols., London, 1818); and "Memorials and Correspondence of Charles James Fox," by Lord John Russell (4 vols., London, 1853–7). Some interesting particulars of the private life of Fox are given in the posthumous "Recollections of Samuel Rogers" (London, 1859), and in "Holland House," by Princess Marie Liechtenstein (London, 1873).

FOX, George, the founder of the society of Friends, born at Drayton, Leicestershire, England, in July, 1624, died in London, Jan. 13, 1691. His father was a zealous Presbyterian, too poor to give his son any education beyond reading and writing. The boy was grave, and fond of solitude and contemplation. He was apprenticed to a shoemaker; but, keeping aloof from his fellow workmen, he meditated upon the Scriptures, gradually shaping the doctrines which he afterward promulgated. About the age of 19 he abandoned his occupation in order to prepare himself for the mission to which he believed he had been called. For some years he led a wandering life, living in the woods and in solitary places, and practising a rigid self-denial. In 1648 he made his appearance as a preacher at Manchester, where the exposition of his peculiar views caused much excitement, and subjected him to imprisonment as a disturber of the peace. Henceforth, undeterred by the assaults of the populace or the persecutions of the magistrates, he travelled over England, preaching his doctrines with an earnestness and persua-
monad as tutor to the children of her brother, the earl of Surrey, who was then imprisoned in the tower, and afterward executed. After the accession of Edward VI. he was restored to his fellowship. In the reign of Mary he fled to the continent, and was employed at Basel as a corrector of the press. On the death of the queen he returned to England. The duke of Norfolk, one of his former pupils, gave him a pension, and he was appointed to a prebend in the cathedral of Salisbury. This office he retained while he lived, his refusal to subscribe to the new articles of religion preventing any further preferment. He was the author of numerous works, all of which are now nearly forgotten save his Acta et Monumenta Ecclesiae, better known under its English name, "Fox's Book of Martyrs," which first appeared in London in 1563. It details the sufferings of the early Protestant reformers. They "great persecutions, and horrible troubles, that have been wrought and practised by the Romish prelates, especially in this realm of England and Scotland, from the year of our Lorde a thousand, unto the tyme now present," and met with great success, though its trustworthiness has always been disputed by Catholics.

FOX, William Johnson, an English clergyman and politician, born in Wrentham, Suffolk, in 1786, died June 3, 1864. He was educated at Homerton Independent college, embraced Unitarian doctrines, and became a preacher, in which capacity he officiated many years at the chapel in Finsbury square, London. He took an active part in politics, on the extreme liberal side, and was a popular speaker for the anti-corn-law league. In 1847 he was elected to represent the borough of Oldham in parliament, as successor to William Cobbett, was returned again for the same borough in 1852 and 1857, and held his seat until he resigned in 1862. He contributed largely to the "Westminster Review" and to other periodicals, and published several works, among which are "Lectures on Religious Ideas" and "Lectures to the Working Classes" (4 vols. 12mo).

FOXES, a tribe of North American Indians of the Algonquin family, noted in history as turbulent, daring, and warlike. They were of two stocks, one calling themselves Outagamies or Foxes, whence our English name; the other Musquakink or men of red clay, the name now used by the tribe. They lived in early times with the kindred Sac's east of Detroit, and some say near the St. Lawrence, so that we may conjecture them to be the Outagami of the early Jesuit narratives, who resided near Lake St. John. They were driven west, and settled at Saginaw, a name derived from the Sac's. Thence they were driven by the Iroquois to Green bay. About 1658 they were forced from this by the Iroquois and Winnebagoes, and finally took post on Fox river. Here they were visited by the trader Perrot and the missionary Allouez in 1687. They numbered probably 500 warriors, cultivated Indian corn, and were expert hunters, but had no canoes. Still turbulent, they made war on the Sioux, and held their own against all their enemies, although suffering severe losses. The missionaries failed to make any great impression on them. At the summons of De la Barre in 1684 they sent warriors who joined Duranteau on Lake Erie for the campaign against the Five Nations. They also took part in Denonville's more serious campaigns. They soon, however, showed hostility to the French, and opened intercourse with the Five Nations, even proposing to remove to their territory. Won, as French writers charge, by English promises, the Foxes under Pemouss, with the Maskoutens and Kickapoos, attacked Detroit in 1712. Du Buisson, the French commander, called out the allies of France, and the Foxes were besieged in their fort, where they made a desperate defense; but they finally fled, were pursued, and almost all destroyed at Presque Isle on Lake St. Clair. The rest of the tribe molested every road, and in 1716 Louvigny was sent against them. He invested their fort at Butte des Morts on Fox river, and compelled them to sue for peace. They continued hostilities against the French and their allies for years, making the road to Louisiana almost impassable. The French sent another expedition against them under De Ligney in 1728, which ravaged their country, and again in 1734. Finally, in 1746, with the aid of the Menomonees and Chippewas, they drove the Foxes from their river to the Wisconsin. Some Foxes however joined the French in their last struggle for Canada, and served under Montcalm at Fort William Henry. At the close of the war in 1763 they were in a large village of logs and bark on the Wisconsin, with fields of corn and vegetables. Although in 1788 they were reported as reduced to 100 warriors, they are at this time said to have increased to 820. The Foxes took no part in Pontiac's war, but befriended the whites. In 1766 they settled at Prairio du Chien, so named from one of their chiefs, called the Dog. When the American revolution began, they took up arms on the side of the English, and fought under De Langlade. English influence prevailed even after the end of the war. The Foxes did not indeed take part in the Miami war, though some may have been involved with the Sac's who did, five chiefs claiming to act for the Foxes and Sac's. By the treaty of Nov. 8, 1804, for $2,284 50 and an annuity of $1,000, the Foxes and Sac's ceded to the United States immense tracts of land on the Missouri, Jefferon, and Wisconsin rivers, and on the Illinois and its branch the Fox. They were at this time chiefly west of the Mississippi, in a single village, 140 leagues above St. Louis, and numbered 1,300. When the second war with England began, 300 of the Foxes and their kindred the Sac's went to Malden to join the British forces, and took part in the attack on...
Sandusky. Keokuk with the friendly Sacs and Foxes retired to St. Louis. In September, 1815, they made peace, agreed to give up prisoners, &c., but one band of Sacs long continued to be called the British band. In 1823 they were on the Mississippi near Fort Armstrong, in three villages, some having moved to the Iowas and returned. They were expert hunters and canoe men, and cultivated 600 acres of land, raising corn, beans, pumpkins, and melons; many were employed in the lead mines, digging 400,000 pounds in a season. They, with the Sacs, ceded lands by the treaty of Aug. 4, 1824, and July 15, 1830, but were to some extent involved in the Black Hawk war in 1831, begun by that chief of the British band of Sacs who wished to retain Rock Island in Illinois. At the close of this war the two tribes made a treaty at Fort Armstrong with Gen. Scott and Maj. Reynolds, ceding lands for an annuity of $20,000 for 20 years. By a subsequent treaty at Rock Island they ceded a part reserved in the last, embracing 256,000 acres, for $192,000. They then centred on the Des Moines in an irregular square tract about 140 miles each way. The Foxes at this time numbered 2,448, cultivating no more than before, though hunting less. Turbulent as ever, they were constantly at war with neighboring tribes. Government removed them again by the treaty of 1842, and in 1849 they were chiefly on the Osage. Since then, in spite of government efforts to civilize and improve them, they have declined in numbers very rapidly, rejecting with steady pertinacity mission aries and schools. In 1872 the Sacs and Foxes who had ceded their lands in Kansas to the United States in 1859 and 1866 numbered only 488, about one half Foxes. They occupied a reservation of 488,840 acres, between the North fork of the Canadian and the Red fork of the Arkansas. The Sacs and Foxes of the Missouri, the band who remained faithful during the Black Hawk war, are reduced to 88, occupying a reservation of 16,900 acres in S. E. Nebraska and N. E. Kansas. This band has nearly twice as much land under cultivation as the former, though those of the Missouri have more live stock. The latter have annuities amounting to $60,000; those of the Missouri to $10,500. In 1857 a party of 817 Sacs and Foxes, tired of being constantly moved from reservation to reservation, bought lands in Tama, Iowa, unaided by government, for they received no annuities. Here they set to work, and have $10,440 invested in stock, and have raised $2,715 worth of produce in a year, while by hiring out as farm laborers they are rapidly becoming industrious and self-sustaining. The farmers, who at first laughed at the idea of employing them, now find them good workers.

FOX HOUND. See Hound.

FOX ISLANDS. See Aleutian Islands.

FOX RIVER. I. A river of Wisconsin, called by the Indians Neenah. It rises in the S. central portion of the state, and flows first nearly S. W. to within 14 m. of the Wisconsin, when it turns suddenly N., and after a course of a few miles assumes a N. E. direction, passing through Lake Winnebago, and into the S. end of Green bay. The rapids in its lower course furnish immense water power. The channel has been improved so that steamboats pass from Green bay to Lake Winnebago. The subject of connecting the Fox and Wisconsin rivers by a ship canal, so as to admit vessels from Lake Michigan into the Mississippi river, has been much discussed, and a government survey of the route has been made. The whole length of Fox river is about 200 m. II. Also called the Piasa, a river which rises in Waukesha co., Wisconsin, flows nearly due S. until it reaches Oswego, Illinois, when it turns S. W., and falls into the Illinois river at Ottawa, after a course of 300 m. It affords abundant water power.

FOY, Maximilien Sébastien, a French soldier and orator, born at Ham, Feb. 8, 1775, died in Paris, Nov. 28, 1825. He entered the army in 1791 as second lieutenant of artillery, served successively under Dumouriez, Moreau, Masséna, and Bonaparte, and became colonel in 1801. His further advancement was for a time impeded by his freedom of speech and his vote against making Napoleon emperor; but for his distinguished services in the Peninsula he was made brigadier general in 1808, and general of division in 1810. At Salamanca, in 1812, he protected the retreat of the French army, and in the following campaigns gained great applause by his skilful manoeuvres. At the battle of Orthez in 1814 he was seriously wounded. On the first restoration he was appointed inspector general of infantry. During the hundred days he was placed in command of a division, fought at Quatre-Bras, and was wounded at Waterloo. On the second restoration he retired to private life, and devoted himself to a history of the peninsular war. In 1819 he was elected to the chamber of deputies by the department of Aisne. For six years he held his seat in the legislature, where he advocated constitutional liberty with energy and boldness, and was recognized as the national orator. His health, impaired by his former wounds, broke down under his parliamentary labors, and he died of a disease of the heart. It having been reported that the only inheritance left his children was his fame, subscription lists were opened, and within a few days the amount had reached 1,000,000 francs. The speeches of Gen. Foy were collected and published in 2 vols. 8vo (Paris, 1826). His unfinished Histoire de la guerre de la Péninsule appeared in 1827, in 4 vols. 8vo.

FRACTION (Lat. frangere, to break), in arithmetic and algebra, an expression for an une xecuted division, originally invented to represent a quantity less than a unit. Thus 3 originally signified three quarters of one, and afterward was used for the fourth part of three, these
two quantities being identical. The dividend number is called the numerator, because in arithmetic it numbers how many parts are taken; and the divisor is called the denominator, because it names the parts. These terms are retained in algebra, where it is evident that their literal meaning is inapplicable. Fractions are also used to express the ratio of the numerator to the denominator. Thus the expression \( \frac{a}{b} \) may signify the ratio of the sum of the quantities \( a \) and \( b \) to their difference, or the quotient arising from the division of that sum by that difference. The propriety of indicating the quotient and the ratio by the same sign is evident from the consideration that the quotient bears the same ratio to unity that the dividend bears to the divisor. A decimal fraction is one whose denominator consists of 1 with zeros annexed, in which case the denominator is not written, but is understood from a point being prefixed, with zeros if necessary; thus, \( \frac{371}{100} \) means \( 0.371 \), \( \frac{71}{1000} \), and so on. A continued fraction is a fraction whose numerator is a whole number plus a fraction whose numerator is 1 and denominator a whole number plus a fraction, &c.

**Fracture**, in surgery, a disruption or separation between the parts of a bone or cartilage, produced by external violence or the sudden and forcible contraction of muscles. The fracture is said to be simple when there is no external wound; compound when complicated with lesion of the surrounding soft parts; and comminuted when the bone is broken into many fragments. Fractures may occur at any time from the end of intra-uterine life to extreme old age; in youth, fractures are comparatively rare on account of the elasticity of the bones, and in advanced life common from their brittleness. Ruptures of vessels and nerves are the most dangerous complications of fractures of the extremities; gangrene is often the consequence of the former, and paralysis, convulsions, or intense pain and inflammation, of the latter; comminuted fracture is very apt to be followed by tedious suppuration, necrosis, false joint, or much shortened limb; dislocation also is not frequently added to fracture. Fractures may be transverse or oblique; the former are most common in children, and are accompanied by little displacement; the latter are the most frequent, and often require all the surgeon's skill and sufferer's patience to effect permanent reduction and prevent deformity of the limb. The causes of displacement in the ends are muscular contractions and the weight of the fractured part; the lower fragment rides over the upper, sometimes to the extent of several inches. The bones most liable to fracture are the superficial ones, like the clavicle, tibia, and skull; or such as, like the radius in the forearm, are likely to receive the weight of the body during a fall; old age, caries, and cancerous, scrobutic, and venerous diseases, predispose to fracture. Violence applied to a part does not always produce a direct fracture; for instance, a fall upon the shoulder may indirectly break the clavicle; the knean and the olecranon are the bones most commonly broken by muscular action. The physiological symptoms of fracture are pain and inability to move the limb; the physical characters are unnatural mobility of the parts, change in the length, direction, or form of the limb, and crepitation when the broken fragments are moved upon each other. When there is great swelling, it is often difficult to ascertain the nature or even the existence of a fracture. The course of a simple fracture is a painful and inflamed swelling a few days after the accident, with more or less febrile reaction; these gradually subside, and with proper treatment the bone unites in from one to two months, with or without deformity according to circumstances not always under the control of the surgeon; when the constitution is diseased, or the reparative process judiciously interfered with, union may not take place and a false joint be formed. Complicated fractures often terminate in the death of portions of bone and of the soft parts, in unhealthy abscesses and tetanus, leading perhaps to fatal consequences unless the limb be removed. The prognosis of fracture of course depends on its situation, extent, complication with wounds, and a variety of circumstances which will occur to every physician. The process of reparation has been described in the article Bone (vol. iii., p. 61), and it will only be necessary to say here that lymph is effused between the broken surfaces, which is gradually converted into cartilage, and in a few weeks into a spongy osseous mass called the provisional callus; this holds the ends together for a few months until the permanent callus is deposited between them; the former is gradually absorbed, and the latter has all the characters of true bone. In the interior of the skull, however, and in the cavities of the synovial membranes of the joints, no provisional callus is formed; if the parts be kept in close apposition, bony union will slowly take place; if not, the union will be ligamentary. The indications of treatment are to reduce or set the fragments, and keep them at rest and in close contact, so as to prevent deformity; all disturbing muscles must be relaxed, the ends of the bones extended, and the parts properly supported and kept in place; the limb is bandaged, and some kind of splint or apparatus is applied to keep it immovable and of its natural length. Splints are made of wood, pasteboard, tin, and more recently and best of gutta percha, all properly padded and secured against displacement; the starched bandage, consisting of layers of cloth imbedded with starch or dextrine, is light, firm, and capable of very exact application; a plaster of Paris apparatus has been much used in Germany, especially
for intractable persons and on the field of battle. When swelling and inflammation run high, antiphlogistic and refrigerant applications should precede the use of bandages and splints; and the latter when applied should be loosened when swelling comes on, and afterward readjusted so as to keep the parts uniformly in place. The variety of bandages, splints, and apparatus for the different kinds of fractures is very great; and in nothing does American surgery stand more preeminent than in its ingenious and effectual instruments for the treatment of broken bones. The accompanying symptoms of depression, inflammation, delirium, painful twitches of muscles, and other complications, must be treated on principles familiar to every surgeon. When a false joint is produced, attempts at union are made by exciting inflammation in the separated pieces by rubbing, the seton, sawing off the ends, and other operations now in vogue; care being taken at the same time to strengthen the patient, and to correct any evident constitutional vicissitudes. In compound fractures, especially the severe ones from railroad accidents, the question of amputation is frequently a most difficult one to resolve; much depends on the strength, habits, and age of the patient, the degree of laceration, the proximity to joints, and the injury to vessels and nerves; if the operation be decided on, it is generally performed at once, before the accession of inflammatory fever. If it be determined to retain the limb, the bone should be reduced to its natural position, loose pieces removed, and the necessary applications be made to induce the wounds to heal; in proper time bandages and splints should be applied; cooling lotions, opium to quiet pain and restlessness, prevention of lodgment of matter, tonics and stimulants to support the strength under profuse discharges, are the additional general indications of treatment.

FRAMINGHAM, a town of Middlesex co., Massachusetts, on the Boston and Albany railroad, at its junction with a branch to Milford, and at the junction of several divisions of the Boston, Clinton, and Fitchburg line, 20 m. W. by S. of Boston; pop. in 1870, 4,988. It is intersected by Sudbury river, and borders on Cochituate lake. There are manufactories of woolens, cars, and carriages, hats and bonnets, &c., and a national bank. The town is the seat of a state normal school, which in 1872 had 10 instructors, 165 pupils, and a library of 1,900 volumes. There are 20 public schools, including 2 high schools, with an average attendance of about 700 pupils; a public library, with about 5,000 volumes; and 10 churches (2 Baptist, 5 Congregational, 1 Episcopal, 1 Methodist, 2 Roman Catholic, and 1 Universalist).

FRANÇAIS, wine, as it is also spelled, was esteemed in France in 1860; they bore the impression of the king on horseback, and the device Francorum rex, and were called francs a cheval; they were of fine gold, and were worth 1 pound (livre), or 20 sols, and weighed 2½ pennyweights. Under Charles V. the impression was of the king on foot, and they were styled francs à pied, but retained the same value. Under Charles VII. their weight was reduced to about two pennyweights. The first silver francs were coined by Henry III. in 1575, and presented on one side the head of the king, and on the other a decorated cross, and weighed 385883 pennyweight, and had a current value of 20 sous. Henry III. also coined half-francs and quarter-francs. In 1602 the value of the franc was increased to 21 sous. Having suffered many alterations, chiefly from clipping, Louis XIII. prohibited its circulation for more than its actual value, and substituted the silver louis of 60, 80, 15, and 5 sous value. The franc then ceased to be real money, remaining a unit of valuation. But on the adoption of the decimal system, in 1795, it was chosen as the monetary unit, being divided into tenths, called décimes, and into hundredths, called centimes; it had a legal weight of 3.215 pennyweights, 1/2 fine; coins were also struck of 5 and 10 francs value in silver, and of 20, 50, and 100 francs in gold. In Switzerland the franc was adopted as the unit, along with the whole French monetary system, May 7, 1850. In 1864 the pieces of 50 and 20 centimes value were replaced by pieces of equal nominal but less intrinsic worth. After the monetary convention between France, Belgium, Italy, and Switzerland, in 1866, the standard franc of the law of 1795 ceased to exist except in the five-franc pieces; the pieces of 50 and 20 centimes value being reduced to 885 of pure silver instead of 900, and the law requiring their withdrawal from circulation when they have lost °05 in weight.

FRANÇAIS, Antoine, count, popularly known as François de Nantes, a French politician and author, born at Beaurepaire, Isère, Jan. 17, 1756, died in Paris in 1866. He was the son of a notary, received a superior education, and became in 1789 an advocate and customs director at Nantes and an ardent revolutionist. Subsequently, as a member and for some time president of the legislative assembly, and as a member of the council of five hundred, he acquired great popularity by his denunciations of royalists and priests. He readily accepted office, however, under the consulate, and rose to be director general of the octroi department, which gave him opportunities of offering scurries to poor literary men, who regarded him as a Maccenas. He retained this influential post during the empire, when he was made a count. From 1810 to 1823 he represented the department of Isère in the chamber of deputies. His revolutionary pamphlets met with but meager success, but his miscellaneous writings brought him little fame. They include Tableau de la vie rurale, ou l'agriculture enseignée d'une manière dramatique (3 vols., Paris, 1829).
FRANCE (Lat. Gallia or Francia; Ger. Frankreich, empire of the Franks), one of the principal countries of Europe, occupying the western end of the central part of that continent, between lat. 42° 20' and 51° 6' N., and lon. 4° 45' W. and 7° 38' E. It is bounded N. by the North sea and the Strait of Dover (Pas de Calais), and N.W. by the English channel (La Manche), which separates it from Great Britain; W. by the Atlantic and the bay of Biscay; S. by the Pyrenees, forming its frontier toward Spain, and by the Mediterranean; E. by the Alps, and the Jura and Vosges mountains, which respectively divide it from Italy, Switzerland, and the German empire; N.E., on which side it has no natural boundary, by a conventional line which runs from the Vosges, crossing the Moselle S. W. of Metz, to the shores of the North sea, some 25 m. E. of the Strait of Dover, along the frontiers of Germany, the grand duchy of Luxemburg, and Belgium. Under the meridian of Paris, that is, toward its centre, it measures N. to S. about 590 m., and E. to W., between lat. 48° and 49°, about 555 m.; while its greatest length N. to S. E. from the extremity of Finistère to Mentone, is about 775 m., and its greatest breadth, N. E. to S. W., from a point E. of Lunéville to the W. extremity of the Pyrenees, a line crossing the former nearly at right angles, is about 550 m. Its total area, the coast islands and Corsica included, is officially computed at 52,857,695 hectares, or 204,091 sq. m. It holds the fourth rank in extent among European countries, being surpassed by Russia, the Austro-Hungarian empire, and Germany.—The shape of France is an irregular hexagon, the sides of which might be drawn respectively along the English channel, the Atlantic, the Pyrenees, the Mediterranean, the Alps, and the Vosges mountains, the last side running from the end of this range to the North sea. The first of these sides, or the N. W. coast, presents from Dunkirk to the mouth of the Somme a succession of sandy downs, from which project Capes Gris Nez and Blanc Nez, opposite Dover. From the mouth of the Somme, sweeping S. W. toward the mouth of the Seine, the coast is characterized chiefly by cliffs of chalk and marl, with here and there harbors, the most important of which is Dieppe. The Seine now widens into a small bay, bearing the name of Seine, Havre, or Calvados, from which the coast line runs almost due W., fringed by a chain of reefs, to the mouth of the Vire, whence it takes a N. direction and forms the square-
FRANCE

English Miles

80 60 40 20 0
boundary line, it is flanked by precipitous Alpine slopes, and gradually assumes the character of the Northwestern Riviera. Besides the two great mountain chains which form the limits of France toward Spain and Italy, several others of minor importance, belonging to the Alpine and Pyrenean systems, intersect the country. The principal of these chains, which is but a part of the great European watershed, starts from the Pyrenees, taking first a winding course N. E. nearly parallel to the Mediterranean shore, then setting northward, under the names of Black mountains, Cévennes, and Côte d’Or; near lat. 45°, where it is called the plateau of Langres and Monts Faucilles, it makes a curve eastward, and then branches, projecting northward the Voixes, and southward various ridges which, through the Jura, connect with the Alps. This chain thus divides France into two very unequal parts, the greater sloping toward the Atlantic and the English channel, the smaller toward the Mediterranean Sea; Four ranges, the general direction of which is N. W., branch off from this watershed and separate the basins of the various rivers flowing into the Atlantic and the English channel: 1. the hills known as the eastern Ardennes; 2. the western Ardennes, connecting with the hills of Picardy and Artois; 3. the branch consisting of the Morvan mountains, the hills of the Oiselle forest, those of lower Normandy, and the Monts d’Arès, extending through the N. part of Brittany; 4. the mountains of Auvergne, which may be more properly called a cluster, of which the mountains of Limousin and hills of Poitou are but the continuation. The Pyrenees also send some secondary ramifications southward. The highest summits of this great chain within the limits of France are from 9,000 to 11,000 ft. above the sea. In the Cévennes ridge, M. Maun is 5,700 ft. high. The Reculet and the Dôle tower over the ranges of the Jura to about 5,500 ft. Among the rounded summits of the Voixes, which are called “balloons,” the only one deserving notice is the Ballon d’Alesace, in the southern part of this chain. The group of Auvergne presents the Fuy de Dôme, Mt. Dore or Dore, and the Pomb du Cantal, rising to a height of about 6,000 ft. The loftiest summit of the country (excluding Mt. Blanc, which since the annexation of Savoy is exactly on the Italian boundary, but cannot properly be considered as within French territory) is the Pointe des Écrins in the Mont Pelvoux group of the Dauphiny Alps, which is about 13,500 ft. (according to other measurements, Mt. Olan).—The great W. slope of France is divided into three parts, one inclined toward the North sea, another toward the English channel, and the third toward the Atlantic. The first is drained by the Moselle, the Meuse, which flows in a northern direction between the E. and W. Ardennes, and the Scheldt (Escouat); the last two are properly Belgian. The Somme, the Seine, the Orne, the Vire, and the Rance flow into the English channel. The Seine rises at St. Seine, at the foot of the Côte d’Or, runs in a N. W. direction, receives on its left the Yonne, and on its right the Arbe, the Marne, and the Oise, and flows into the sea at Havre. The Atlantic receives the Aulne, the Blavet, the Vilaine, the Loire, the Sèvre-Niortaise, the Charente, the Gironde, and the Adour. The Loire, which is the largest river and waters the most central part of the country, rises in the Cévennes, at Mt. Mèzin, runs N. and N. W. to Orleans, and thence S. W. and W. with a somewhat tortuous course to its mouth. It receives on the right the Nièvre, and further down the Mayenne, which, after being joined by the Sarthe, assumes in its lower part the name of Maine; on the left the Allier, the Cher, the Indre, the Vienne swallowed by the confluence of the Creuse, and the Sèvre-Nantaise. The Loire and its tributary streams, particularly those from the south, roll down immense quantities of gravel and sand, which, continually shifting, render the navigation difficult and dangerous. A great dike, called the “Levee of the Loire,” the origin of which is lost in antiquity, bounds the course of the river on the right bank from Blois to Angers; this vast work is generally about 25 ft. high and 40 broad. The Garonne, which has its source in the valley of Aran in Catalonia, follows one of the passes of the Pyrenees, flows N. E. until it reaches Toulouse, then turns N. W. and becomes navigable; it receives on the right the Tarn and the Lot, passes Bordeaux, where it is half a mile wide, and meeting the Dordogne about 12 miles below this city, takes the name of Gironde, forms several islands, and broadening into an estuary empties into the sea. The navigation between Bordeaux and the sea is impeded by many shoals; the tide flows up about 80 m., and is sometimes preceded by a huge billow that sweeps destructively along the shore. This phenomenon is called the mascaret. The Adour, rising in the Pyrenees, has a semicircular course toward the bay of Biscay, into which it enters after receiving numerous mountain streams. The E. slope, which is inclined toward the Mediterranean, is enclosed between the Jura and the Alps on one side, the Côte d’Or and the Cévennes on the other. It is drained almost entirely by the Rhône and its branches. The Rhône, which, rising in Switzerland, enters France below Geneva, is not very wide, and runs generally with the impetuosity of a torrent. It joins the Saône at Lyons, and flows S. to the Mediterranean, discharging by several branches, forming a delta. It is joined on the left by the Isère, the Drôme, and the rapid Durance, which, like the Isère, rises in the Alps. The few lakes of France scarcely deserve the name; the largest is that of Grand Lieu, near the mouth of the Loire; the most picturesque are those of Gérardmer in the Vosges, and Nantua in the southern part of the Jura.—The geological outline of France is easily marked. A belt of granitic rocks.
FRANCE

running through the Vosges, the Alps, the Pyrenees, and the peninsula of Brittany, forms a kind of basin in the centre of which a pile of the same formations rises. This core hitherto of the Auvergne mountains, which, being mostly composed of granite, gneiss, and micaceous schists, bear abundant traces of recent volcanic activity; extinct craters, lava streams, &c., present an interesting field for the observations of the geologist. The primary rocks at the circumference are of the greatest diversity, the granite however predominating at the extremity of the peninsula of Brittany. The intervals between the external belt and the central nucleus are mostly filled up by secondary formations, interspersed with tertiary deposits. Both are interesting. The former, which are calcareous or marly and generally compact, contain a vast number of shells, madreporae, and other organic remains; stretching in long hill ranges, of little elevation, they run through Lorraine, Burgundy, Franche-Comté, Dauphiny, and Languedoc. Many are steep and bare, or covered only by a thin vegetable soil; but some, the hills of the Côte d'Or especially, are admirably suited for the vine. The most remarkable tract of tertiary formations is known as the "Paris basin;" a larger one covers nearly the whole of the valleys of the Garonne and the Adour, while several others of smaller extent are found in the valleys of the Loire and the Allier. These are mostly calcareous, enclosing great quantities of shells and the remains of fossil mammalia of large size. The district around the mouth of the Rhône is entirely alluvial.—The soil of France, taken as a whole, is of superior quality; and the productive part of it bears a larger proportion to the entire extent of the country than in most other European states. Of the entire soil only 73 per cent. is uncultivated or unproductive. Of the productive portion 80 per cent. is arable land and gardens, 4 per cent. vineyards, 29 per cent. meadows and pastures, and 18 per cent. forests.—The climate, being on the whole temperate, is one of the finest in Europe; it is however greatly diversified by the differences of latitude, elevation, soil, exposure, &c. In this respect France has been divided into four regions, each being characterized by a special production: the first, the region of the cereals, extends from the northern frontier to a line drawn from Mézières to Nancy; the second, the region of the vine, is comprised between this line and another passing from a point near Nancy to the mouth of the Charente; the third, through which the cultivation of maize prevails, is bounded S. by a line extending from Grenoble to Perpignan; and the fourth, the region of the olive, includes the southeastern part of the country. The air is generally pure and healthy. The mean annual temperature of different parts of France has been estimated as follows by Humboldt: at Toulon, 62° F.; at Marseilles, 59° 50; at Bordeaux, 56°; at Nantes, 55° 2; at Paris, 51° 2; and at Dunkirk, 50° 6. More rain falls annually in the valley of the Rhône than on the Atlantic slope; the average fall in the former being about 80 inches, while it does not exceed 20 inches in the latter. The centre of the country enjoys a happy medium of temperature and climate; in the south the summers are long, dry, and hot. The mountainous region of Auvergne is visited by long and severe winters. The departments around the gulf of Lyons are subject to disagreeable winds, which sometimes prove injurious to the crops; the most dreaded is the mistral.—Of the vegetable products, the most generally cultivated are wheat, rye, maize, buckwheat, oats, barley, potatoes, coalewort, black poppy, &c. The chief grain-growing districts are the departments of Eure-et-Loir, Aisne, Le Nord, Meurthe-et-Moselle, Seine-et-Marne, Seine-et-Oise, Seine-Inférieure, Somme, and Pas-de-Calais. Barley, oats, oleaginous seeds, hops, and beet root are mostly cultivated in the districts of Le Nord; buckwheat in Brittany. Meadows and pastures are principally found in Normandy. There are vineyards in 76 of the departments. As regards the cultivation of the vine, France occupies the first rank among the states of Europe. Though the amount of wine produced is subject to very considerable variations, it always constitutes one of the most important articles of export. From 1864 to 1889 the produce was as follows (1 hectolitre = 29.41 gallons): 1864, 50,685,000 hectolitres; 1865, 68,948,000; 1866, 60,888,000; 1867, 89,128,000; 1868, 52,088,000; 1869, 70,000,000. The production of red wine is to that of white wine nearly as 8 to 1. The average price of red wine is 14 francs a hectolitre; that of white is 11 francs. Apple trees are abundant in the northwest, and the Normandy cider enjoys a wide reputation in France; hemp and flax are raised in large quantities in the same region; attention is given to the mulberry tree in the south and southeast; madder is successfully cultivated in the southeast on the banks of the Durance; tobacco is raised in the departments of Le Nord, Pas-de-Calais, Gironde, Ille-et-Vilaine, Lot, and Lot-et-Garonne. The principal forest trees are the chestnut on the central mountains, the oak in the Pyrenees, and the fir in Gascony. The most richly wooded districts are the Ardennes table-land, the Vosges, the plateau of Langres, the Côte d'Or, the Cévennes and their ramifications, the Jura, and the Alps. The destruction of wood has been considerable within the last two centuries, and the forests do not cover more than 20% of the whole area of the country. The principal forests still in existence are those of Compiègne, Fontainebleau, L'Estérel, Rambouillet, Villers-Cotterets, and Orleans. The French flora comprises upward of 800 genera and 6,000 species. The numbers of live stock in 1866 were as follows: horned cattle, 12,833,000; sheep, 80,116,000; horses, 3,163,000; mules
and asses, 865,000; swine, 5,650,000; goats, 1,640,000. Within the last 50 years great attention has been given not only to the improvement of native breeds, but to the introduction of foreign ones, which has been generally successful. The best breeds of cattle are those of Auvergne and Gascony; the sheep of Berry are considered the finest; the fattest swine are raised in Lorraine and the Pyrenees; the horses of Limousin, Brittany, Perche, and Normandy are renowned, those of the last two provinces for their strength and size; the mules of Poitou deserve the same praise. Poultry, which is one of the principal articles in the husbandry of France, is raised with peculiar success in Maine, Augeonnois, and Burgundy. Eggs are important articles of export, especially to England. Bees are principally raised in the departments bordering on the Mediterranean; the most celebrated honey is that of Narbonne. The wild animals are fast diminishing all over the country; the black bear is confined to the higher ranges of the Alps and the Pyrenees, where the chamois and the wild goat are also found. The lynx appears rarely in these mountains and the Cévennes. Wolves, notwithstanding the active war of extermination carried on against them, are still found in some central departments, especially the mountainous districts. The wild boar, roebuck, and fox are found in all well wooded parts. The red and fallow deer are becoming rare, while hares and rabbits are abundant. Several kinds of squirrels, the polecat, weasel, marten, hedgehog, and other small animals are common. Owls and a few beavers are found in some of the southern streams. Reptiles are few; a venomous kind of viper and a harmless adder are to be found in some regions. Among the birds, which are very numerous, are eagles, vultures, falcons, &c. The rivers and coasts generally abound with fish; fisheries are consequently an important industry and a great source of wealth. Several points on the N. W. and W. coasts furnish excellent oysters. The pilchar fishery, which is conducted mostly on the shores of Brittany, is the most important of all; about 8,000 barrels of salted pilchards are sent into the market annually, and the inhabitants on the coast live in great part on fresh pilchards during the season. The herring fishery, the headquarters of which are at Dieppe, has also some importance, as well as the sole, ray, and mackerel fisheries. The tunny fishery is pursued on the Mediterranean. Dunkirk, Boulogne, St. Valery-sur-Somme, Dieppe, Fécamp, and St. Malo send yearly a number of ships to the herring, mackerel, cod, and whale fisheries. — The mineral wealth of France is equally large and diversified, although gold and silver are to be found in but very small quantities. The former appears in some small streams flowing from the Pyrenees; a few veins of the latter are wrought, but with little profit, while the precious metal is extracted in larger quantity from lead and copper ores. Large beds of iron ore are found in nearly all parts of France; they are mostly wrought in the departments of Ardennes, Meurthe-et-Moselle, Haute-Marne, Haute-Saône, Isère, Pyrénées-Orientales, Basses-Pyrénées, Ariège, and Aveyron. They yield annually about 15,000 tons, and give employment to about 16,000 hands. Marble, porphyry, granite, alabaster, and crystals are found in nearly all the mountains; slate in the departments of Ardennes, Maine-et-Loire, and Finistère; building stone of many varieties everywhere. Coal beds of various kinds are also numerous, and within the last 40 years considerable progress has been made in the working of mines. The most productive are to be found in the departments of Le Nord, Loire, Saône-et-Loire, Aveyron, &c., and their annual yield is about 2,000,000 tons. Salt mines are worked in the departments of Meurthe-et-Moselle, Haute-Saône, Doubs, Jura, Ariège, and Basses-Pyrénées, while salt marshes exist along nearly the whole of the seacoast. The produce of both exceeds 1,000,000,000 lbs. annually. Lead is extensively scattered through the mountainous districts, especially in Brittany. Copper is abundant in the Pyrenees, Alpes, and Vosges. Together with these metals, zinc, cobalt, and manganese are found. Alum is gathered in Aisne, Oise, and Aveyron. The mineral springs, which are nearly 900 in number, are divided into cold and hot, ferruginous, gaseous, sulphureous, and salt waters; the most renowned are those of Aix, St. Amand, Bagneres-de-Bigorre, Balars, Barèges, Bourbon-Lancy, Bourbonnes-les-Bains, Canterete, Eaux-Bonnes, Forges, Mont Dor, Plombières, and Vichy.—Previous to the revolution of 1789 France contained 86 provinces, which differed from each other in extent, population, rights, immunities, and administration. By a decree of the national assembly, dated Jan. 15, 1790, the country was divided into departments, which were subdivided into arrondissements, cantons, and communes. According to the official census of 1866, there were 89 departments, 873 arrondissements, 2,941 cantons, and 37,548 communes. In consequence of the loss of territory sustained through the war of 1870–71, these numbers were reduced in the census of 1872 to 87 departments (including Belfort), 862 arrondissements, 2,865 cantons, and 35,999 communes. The following table shows the departments, the former provinces from which they have been chiefly formed, their population, and their capitals:

</tbody>
</table>

According to this table, within a period of a century and a half the population has not even doubled; but it must be borne in mind that during the middle part of this period the population was heavily taxed by the bloody wars of the empire, by which France lost no fewer than 1,700,000 men on the battle field. A comparison of the movement of population in France with that of the other European countries shows that the average increase in France has been smaller than in any other. The annual average increase from 1821 to 1873 has never been more than 0.96 per cent.; from 1851 to 1866, it was 0.21; from 1856 to 1861, 0.11; from 1861 to 1866, 0.37. Only a few departments which contain the largest cities have doubled their population since 1790; quite as many had in 1873 fewer inhabitants than in 1790. The period from 1866 to 1872 was more unfavorable than any preceding one; for even leaving out of account the territory ceded to Germany, it showed an absolute decrease of population. While the present territory of France in 1866 had 86,469,856 inhabitants, it had in 1872 only 86,102,921; a decrease of 86,955 (0.16 per cent. per annum). In only 14 departments, nearly all containing large cities, had there been an increase. The cities with upward of 50,000 inhabitants showed an aggregate increase of 188,496, though in some there had also been a considerable decrease, as in Brest (18,575), Toulon (7,999), and Toulouse (2,084). The causes of the slowness of increase and of the recent positive decrease in French population are too various to be considered here, and many conflicting opinions have been given concerning them. Legislation which has been indirectly repressive of marriage has undoubtedly had much to do with the matter; and many classes of the people have been led by the laws concerning property to take all possible precautions against the increase of their families. Especially, modern French statesmen agree in confessing that the law of March 7, 1793, which abolishes testamentary freedom, and obliges parents to an equal division of their property among their children, has increased the "stability of marriages." The average population to the square mile is 177; the density is greater in the north than in the south. Of the male sex there were 17,980,476, of the female 18,129,445; owing to the war, the decrease of the former since 1866 had been almost double that.
The agricultural population in 1866 was less than in 1851, in which year it amounted to 21,992,974; and in 1872 it showed again a considerable decrease, which, as in many other countries, may be ascribed to the progress of commerce and manufactures, and to the attraction of the cities. The following table shows the number of births and deaths during each of the six years ending with 1870:

<table>
<thead>
<tr>
<th>YEARS</th>

<td>1,02,394</td>
</tr>
</tbody>
</table>

It will be seen that the excess of births, even before the Franco-German war, had been considerably reduced from its usual ratio; and that in 1870 it gave way to an alarming excess of deaths, which is not fully accounted for by the ravages of the war, but indicates a progressive decrease of fecundity in the population. Twice before there had been an excess of deaths over births, in 1854 of 69,318, and in 1855 of 38,606. The illegitimate children in 1865 constituted 7.65 per cent. of all births; in 1866, 7.62; in 1867, 7.62; in 1868, 7.62; in 1869, 7.48; in 1870, 7.46. The relation of marriages to the entire population was in 1865 as 1 to every 128.8-inhabitants; in 1866, 1 to 129.5; in 1867, 1 to 197; in 1868, 1 to 127.3; in 1869, 1 to 121.4; in 1870, 1 to 165. In no previous year since 1815 had the decrease of marriages been so large as in 1870. The general proportion from 1825 to 1869 had been 1 to from 118 to 128, with the exception of 1847, when it was 1 to 142. The loss of inhabitants by emigration is very small. From 1849 to 1858 the number of emigrants was less than 200,000, while the German emigrants numbered more than 1,200,000, and those from Great Britain 2,750,000. From 1859 to 1863 only 40,000 emigrated, including 10,000 to Algeria. In the following table all the cities of France having more than 70,000 inhabitants are arranged according to population:

</table>

The bulk of the French nation consists of the descendants of Gallo-Romans mixed with German and Scandinavian barbarians (Burgundians, Goths, Franks, and Northmen), who invaded Gaul between the 5th and 10th centuries. But the latter elements are far from being important, and the French may be called a neo-Latin race; their language partakes of the same character, being Latin with a slight admixture of Germanic and Celtic. Although the various races have melted into a single people, some of the original types may be still traced, especially in the remote parts of the country or along the frontiers. The inhabitants of Brittany mostly retain the characteristic features of their ancestors, and the Breton language is still spoken in the western part of that province. The Basques preserve their primitive language. The German element of the population has been reduced to an insignificant number by the cession of Alsace and Lorraine. The Corsicans speak Italian. The inhabitants of other than French descent were in 1872 estimated as follows: Walloons, 1,800,000; Celts, 1,100,000; Italians, 400,000; Basques, 200,000; Spaniards, 100,000; Flemings, 100,000; Jews, 46,000; gypsies, 10,000; Cagots (in the Pyrenees), 5,000. Although, as has been stated, 33 per cent. of the population of France, and a very much larger proportion of the land, are devoted to agriculture, yet the department of production is far from being in an advanced state of progress, when compared with the agriculture of other nations. By some writers this is attributed to the effect of the law of 1798, which requires the division of estates equally among the children of the testator, and has thus divided France into millions of small farms whose owners have not sufficient capital to cultivate them in the best manner. Comparatively few kinds of labor-saving machinery are in use; the methods of culture are generally primitive and unintelligent on the smaller farms, and the large land owners have only introduced more modern methods within the last 15 or 20 years. In manufactures, on the other hand, great progress has been made; and as respects the extent and value of her products, France ranks as a manufacturing country next to Great Britain. While she cannot enter into competition with the latter in the manufacture of cotton goods and several other valuable articles, she excels her and other countries in nearly all those requiring particular taste and elegance. Her silk goods hold the most prominent place in this respect. St. Etienne, Lyons, Avignon,
Nîmes, and Tours are the principal seats of the important manufacture, the excellence of which is sufficiently proved by the fact that four-fifths of its products are exported. In the manufactures of jewelry and bronze goods France exceeds every other country of the globe; their principal seat is Paris. The capital is also the great centre of the fabrication of surgical and philosophical instruments, books, and what is especially called "articles demi-mode." The publishing business is also carried on with some activity in Lyons, Tours, and several other large cities. Laces, tulle, and embroideries are mostly manufactured in and around Nancy and St. Quentin. Iron works are to be found in various parts of France; the most important are at Creuzot, Nevers, and St. Etienne; the product of pig iron has been on the increase, but is not yet sufficient to supply all the manufactories. The making of cutlery is principally carried on at Paris, Langres, Châtellerault, Moulins, and Thiers; hardware is produced at the same places, as well as at St. Etienne, Charleville, &c. There are manufactories of fine porcelain and earthenware at Sèvres, Limoges, Nevers, and Monteran; the porcelain of Sèvres is much and justly esteemed. Watchcases are made at Besançon, Montbéliard, Pontarlier, and Versailles. Leather is exported from France in large quantities than from any other country of Europe; the best manufactures of leather ware are at Paris and Grenoble. The woolen manufacture is of paramount importance; its chief seats are Sedan, Louviers, and Elbeuf, for cloths; Vervins, Rhuins, Amiens, Arras, St. Omer, Roubais, and Tourcoing, for flannels and other coarse stuffs; Paris, Beauvais, and Aubusson, for carpets; the number of spindles employed is about 5,500,000. The cotton manufacture, employing about 4,500,000 spindles (after the cession of Alsace and Lorraine, which had over 2,000,000 spindles), and including all kinds of fabrics, is mostly carried on in the departments of Le Nord, Aisne, Seine-Inférieure, Pas-de-Calais, and Vosges. Linens are manufactured principally in the northern provinces. St. Quentin, Valenciennes, and Cambrai produce the best cambriques; Lyons and Alençon, the best muslins. Mirrors of superior quality are manufactured at St. Gobain, St. Quirin, and Cirey. There were in April, 1873, about 514 houses for the manufacture of beet-root sugar, giving an annual product of 350,000,000 kilogrammes. Ship building is principally carried on at Cherbourg, Brest, Rochefort, Marseilles, Toulon, and Bordeaux. The manufacture of tobacco is carried on in 16 establishments belonging to the state. The total number of steam engines used in France in 1868 was 29,485, of an aggregate of 790,194 horse power; of these 33,450, of 288,676 horse power, were used in 19,887 industrial establishments. The great articles of export consist of silk, woolen, and other manufactured goods, wines and brandies, joiners' and cabinetmakers' wares, leather, bronze, steel, and iron wares, paper, refined sugar, china, earthen, and glass wares; while the imports comprise all sorts of colonial produce, cotton, wool, sugar, coffee, spices, dyestuffs, raw silk, woolen, hemp, flax, coal, copper, cattle, hides, &c. These are mostly brought to Marseilles, Havre, Bordeaux, Nantes, Rochelle, Dunkirk, Boulogne, St. Malo, Lorient, Bayonne, Ceté, &c., which are also the outlets of exportation. The following tables, compiled from recent official publications, show the so-called "actual" values of the commerce of France, distinguished as "general" and "special." and the former term comprehending all the imports and exports, and the latter only the imports for domestic consumption and the exports of French produce and manufactures. The "official" value, which is that fixed by law in 1826, is somewhat smaller. The sums are given in millions of francs:
